SELECTED WATER RESOURCES ABSTRACTS

VOLUME 6, NUMBER 21
NOVEMBER 1, 1973

THE LIBRARY OF THE
DEC 3 1973
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W73-13001 -- W73-13650

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 6, NUMBER 21
NOVEMBER 1, 1973

W73-13001 -- W73-13650

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

02. WATER CYCLE

2A. General

SIMULATION OF COUPLED LEAKY AQUIFERS AND SURFACE-WATER SYSTEM,
New Mexico Inst. of Mining and Technology, Socorro. Dept. of Geoscience.
Z. A. Saleem.
Available from the National Technical Information Service as PB-222 464, $3.75 in paper copy, $1.45 in microfiche. New Mexico Water Resources Research Institute Las Cruces Technical Completion Report No 017, 1973. 70 p, 15 fig, 1 tab, 58 ref, append. OWRR A-028-NMEX (2). 14-31-0001-3231.

Descriptors: Hydrogeology, Water wells, Drawdown, Recharge, Transmissivity, *Groundwater movement, *Computer models, Hydraulic conductivity, Water table, *Aquifers, Artesian aquifers, *Hydrologic models, *New Mexico.
Identifiers: *Leaky aquifers, Surface-water system, *Multiaquifer systems, Discharge, Shallow aquifer, Two-aquifer system, Three-aquifer system, Nonlinear partial differential equations, Storativity, Semi-previous layer, Saturated thickness, Roswell-Artesian Basin, Pecos Basin, Aquitards.

A numerical model for simulation of groundwater flow in multiaquifer systems was developed. A system of nonlinear partial differential equations, isomorphic to groundwater flow in the multiaquifer, was formulated in a finite difference form suitable for the line successive overrelaxation technique. The resulting system of difference equations was solved using an efficient algorithm. The results derived from the numerical simulator for the flow to wells in two coupled aquifers were in good agreement with analytical results for the system. Analytical models of steady groundwater flow in a three-aquifer system which consists of a valley area containing a shallow aquifer and a deep aquifer coupled through an aquitard, and a highland area containing an intake-area aquifer, were derived. Four cases of the system were analyzed: in two of the cases, the vertical variations of the hydraulic head in the shallow unconfined aquifer were assumed small; and for the other two cases, an approximate differential equation to describe the flow in the unconfined aquifer was presented. The results indicated that a variation in the hydraulic characteristics of any one of the three aquifers affected the flow in all three aquifers and the leakage coefficient of the aquitard played a key role in governing the flow in the system. HYDROLOGIC RESPONSE OF MASSACHUSETTS WATERSHEDS,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
J. M. Colonell, and G. R. Higgins.
Water Resources Bulletin, Vol 9, No 4, p 793-800, August 1973. 3 fig, 2 tab, 6 ref.

Descriptors: *Rainfall-runoff relationships, *Massachusetts, *Statistics, Variability, Data collections, Hydrograph analysis, Hydrographs, *Watersheds (Basins).
Identifiers: *Hydrologic response function.

Hydrologic response, defined as the annual direct runoff divided by the annual precipitation, was computed for 21 watersheds in or near western Massachusetts, using a total of 232 years of hydrologic records. Variability of the results over the period of analysis was greater than is desirable to inspire confidence in the usefulness of the hydrologic response function; however, the results do suggest that the hydrologic response concept, with appropriate refinements, could be applied successfully to the problem of delineating hydrologic provinces and determination of drainage and storage in unregulated watersheds. SOME PROBLEMS IN STOCHASTIC HYDROLOGY,
Texas Univ., Austin. Center for Research in Water Resources.
L. R. Beard.
Water Resources Bulletin, Vol 9, No 4, p 633-638, August 1973. 3 ref.

Descriptors: *Stochastic processes, *Synthetic hydrology, *Simulation analysis, *Statistical models, Statistical methods, Mathematical models, *Estimating, *Forecasting.
Identifiers: Stochastic hydrology.

In order to decrease the uncertainty that results in water resource planning and management studies due to the assumed recurrence of historical hydrological sequences, considerable study of stochastic processes in hydrology has taken place during the past 10-15 years. The general objective has been to develop a capability for generating a number of valid sequences, each of which could as reasonably occur as could a recurrence of past events. A number of serious problems have been encountered, the consequence of which has been a serious lag in the application of stochastic processes to real planning and management problems. These problems include an inability to generate droughts in some cases that are as extreme as have occurred historically, the generation of inconsistent values of streamflow at locations on the same stream, the lack of mathematical techniques for the management of incomplete data sets, a great increase in the computation required for planning and management studies, and theoretical and computational difficulties in expanding the scope of stochastic hydrology from monthly quantities to short-period quantities. 'EXTENDED-RANGE' METEOROLOGICAL FORECASTS APPLIED TO MULTI-RESERVOIR MANAGEMENT DECISIONS,
Department of the Air Force, Scott AFB, Ill.
G. E. O'Connor, and R. A. Clark.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 542-554, (1972) 7 fig, 16 ref. OWRR A-019-TEX (3).

Descriptors: *Meteorological data, *Forecasting, *Reservoirs, *Management, *Decision making, *Hydrology, *Monte Carlo methods, Simulation analysis, Monthly, Temperature, Precipitation, Constraints, Surface runoff, Crops, Consumptive use, Evaporation, Mathematical models, Systems analysis.
Identifiers: *Multi-reservoir systems, Accuracy.

The uncertainty of future hydrometeorological conditions occurring within a river basin upsets the decision-making process when applied to water resources management. Presented is a model, developed in an attempt to enhance the operation of a multi-reservoir system; it utilizes 30-day meteorological forecasts of temperature and precipitation issued every 15 days by the National Weather Service, and is called MOHRS--Monthly Operational Hydrometeorological Simulator. The first application of the forecast assumes that the 30-day meteorological forecasts are 'perfect.' Forecast categories of precipitation and temperature provide physical constraints upon quantitative values synthesized by Monte Carlo simulation techniques. An objective analysis scheme reproduces observed spatial patterns well and facilitates computations of surface runoff, reservoir evaporation, and crop consumptive-use. A second application uses information on the accuracy of the forecasts versus observed weather for the 24 forecast periods per year. Results show that the forecasts provided hydrometeorological information which verified better than chance. Conditional probabilities were used to obtain an 'expected value' forecast of temperature and precipitation for each station. In general, this means of establishing knowledge of future conditions of evaporation and consumptive-use has worked well. (See also W73-13134) (Bell-Cornell)

BAYESIAN HYDROLOGIC MODEL BUILDING,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
I. Rodriguez-Iturbe, J. Valdes, R. Lenton, and D. Valencia.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 631-645, (1972). 2 fig, 8 ref.

Descriptors: *Parametric hydrology, *Estimating, *Mathematical models, *Stochastic processes, *Methodology, Streamflow, Synthesis, Decision making, Probability, Planning, Nature, Systems analysis, *Risks.
Identifiers: *Bayesian techniques, *Model building, Errors, Loss function, Autoregressive models.

In order to build water resource management and operation models, a clear understanding must be gained of the stochastic nature of hydrologic processes and the interaction between those processes and the various control alternatives. Future systems will most likely require oberating policies to be devised and these policies will require hydrologic forecasts to be made on the values of both the mean and the extreme values of the variable at hand. The problems of estimating hydrologic parameters as a problem of decision analysis is discussed. The main uncertainties involved in hydrologic model building are examined from a Bayesian point of view. Special attention is given to the selection of the model itself and the estimation of its parameters. A first-order autoregressive model is examined in detail because of its frequent use in hydrologic simulation. It is believed that

Bayesian methods allow the engineer to include economic considerations by formally providing a loss function which specifies the seriousness of the errors in selecting acts, and by assigning prior probabilities to states of nature either on an objective or subjective basis. Furthermore, Bayesian techniques allow engineers to incorporate judgment and experience plus other types of regional information which should not be neglected in parametric hydrology estimation. INFORMATION CONTENT OF THE REGIONAL MEAN,
Pittsburgh Univ., Pa. Dept. of Civil Engineering.
J. D. Salas-La Cruz, and P. Guerrero.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 646-660, (1972). 6 fig, 3 tab, 7 ref.

Descriptors: Water resources development, *Available water, *Estimating, Measurement, Hydrology, Mathematical models, Gaging stations, Regions, Statistical models.
Identifiers: *Sensitivity analysis.

Water resources development requires among other things the knowledge of the water available in the area of interest. This is usually determined by hydrological measurements at various sites which give an estimate of the water available in the area. This estimate is generally expressed in the form of statistical characteristics such as the mean and the variance. The relative information content, of the mean of a hydrological variable, representative of a given region, is defined. A general formula for the information content I is given. Sensitivity analysis is shown to be sensitive to the parameters of the model describing the series. (See also W73-13134) (Bell-Cornell)

WATER RESOURCES OF BROWARD COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
C. B. Sherwood, H. J. McCoy, and C. F. Galliher.
Geological Survey Open-file report (73007), 1973. 197 p, 64 fig, 7 tab, 32 ref.

Descriptors: *Water resources development, *Groundwater resources, *Surface waters, *Water quality, *Florida, Hydrologic data, Basic data collections, Aquifer characteristics, Water wells, Water yield, Transmissivity, Well data, Water pollution sources, Urbanization, Saline water intrusion, Water supply, Water utilization.
Identifiers: *Broward County (Fla).

Broward County, Florida, has large potential supplies of freshwater because of its approximately 60-inch annual rainfall and its massive manmade surface-water management system integrated with the highly permeable Biscayne aquifer. However, the rapid urbanization of the area has been accompanied by major natural and manmade water problems. Natural problems of flood and drought are caused by extreme variations in rainfall that range from as much as 20 inches per day during the rainy season to little or none for extended periods in the dry season. Manmade water problems include: seawater intrusion that resulted from overdrainage of the area; obtaining adequate water supplies for the mushrooming population; and pollution caused by the disposal of increasing quantities of wastes. The unconfined Biscayne aquifer is the source of all fresh groundwater in Broward County. Wells that tap the thick limestone in the deep part (100 or more feet) of the aquifer near the coast yield more than 1,000 gpm. The transmissivity of the aquifer ranges from 0.4 mgd per foot in the northern part of the county to 2.5 mgd per foot near the southern part. The quality of the groundwater is generally within the standards for potable water. (Woodard-USGS)
W73-13209

APPLICATION OF A SIMPLE HYDROLOGIC MODEL FOR RAINFALL-RUNOFF RELATIONS OF THE DALTON WATERSHED,
Technion - Israel Inst. of Tech., Haifa. Dept. of Civil Engineering.
M. H. Diskin, N. Buras, and S. Zamir.
Water Resources Research, Vol 9, No 4, p 927-936, August 1973. 7 fig, 3 tab, 5 ref.

Descriptors: *Rainfall-runoff relationships, *Small watersheds, *Simulation analysis, Model studies, Reservoirs, Runoff forecasting.
Identifiers: *Israel (Dalton Plateau).

The problem of determining the best operating policy for a small storage reservoir or pond was solved by means of a simulation model based on a simple conceptual hydrologic model developed for rainfall-runoff relations for the watershed contributing to the pond. The hydrologic model is represented by a single element described by one parameter and having only one state variable. The simple model was found to give an adequate representation of the watershed for the particular problem for which it was used. (Knapp-USGS)

A SURVEY OF THE WATER RESOURCES OF ST. THOMAS, VIRGIN ISLANDS,
Geological Survey of Puerto Rico, San Juan.
D. G. Jordan, and O. J. Cosner.
Geological Survey Caribbean District open-file report, 1973. 55 p, 35 fig, 9 tab, 16 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater resources, *Potential water supply, *Virgin Islands, Water quality, Hydrologic data, Streamflow, Runoff, Water yield, Aquifer characteristics, Water wells, Water supply, Water resources development, Water utilization, Geology, Climates, Topography, Rainfall, Groundwater recharge.
Identifiers: *St. Thomas (V I).

St. Thomas, with an area of 32 square miles, is the second largest of the Virgin Islands of the United States. The island is mountainous, and slopes commonly exceed 35 degrees along a central ridge 800 to 1,200 feet high running the length of the island. Water in Charlotte Amalie, the capital, is supplied by seawater desalting and water barged from Puerto Rico and is augmented by hillside rain catchments and individual roof catchments. Rainwater augmented by water hauling and a few wells is the source of water for the rural areas. Streamflow is meager--2% to 8% of the annual rainfall--and is predominantly storm runoff. Test drilling has shown that water can be obtained from fractured volcanic rocks in nearly all parts of the island. Fully developed, the surface water and groundwater resources of the island could yield 1.3 million gallons of water per day. Groundwater is slightly saline, commonly containing more than 1,000 milligrams per liter dissolved solids. Surface water is similar in mineral content to groundwater during base flow. (Woodard-USGS)
W73-13516

2B. Precipitation

EVALUATION OF TECHNIQUES FOR DETERMINING AVERAGE PRECIPITATION SEMIARID VALLEYS OF IDAHO,
Idaho Univ., Moscow. Dept. of Civil Engineering.
D. L. Curtis.
M Sc Thesis, March 1973. 104 p, 12 fig, 15 tab, append. OWRR-A-034-IDA (1)

Descriptors: *Precipitation (Atmospheric), *Precipitation gages, *Rainfall disposition, *Isohyets, *Idaho, Watersheds (Basins), Data collections, Methodology, Mathematical studies, Equations, Regression analysis, Forecasting, Mapping.
Identifiers: *Reynolds Creek watershed (Idaho), Precipitation distribution.

The Raft River basin in south-central Idaho and the Reynolds Creek Experimental Watershed in southwest Idaho were studied to determine precipitation distribution in an attempt to develop better isohyetal maps for semiarid mountain valleys. Due to gage malfunctions in the Raft River network, only the data collected by the Agricultural Research Service on Reynolds Creek was analyzed. Two methods were used to determine precipitation distribution. The computer isohyetal method worked well on Reynolds Creek but should be used only where a dense gage network is available. The Thiessen method was preferred for areas where gages are spread out. The Thiessen method was also used to determine the relative accuracy of the mean precipitation estimate using less than 45 gages. A multiple-regression equation was developed for selecting the point precipitation measurements to be used in estimates of average precipitation on the Reynolds Creek Experimental Watershed. Results indicated that no fewer than 20 gages should be used to obtain a good estimate of average precipitation. (Woodard-USGS)

UNCERTAINTY IN THE RETURN PERIOD OF MAXIMUM EVENTS: A BAYESIAN APPROACH,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
D. Davis, L. Duckstein, C. Kisiel, and M. Fogel.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 853-862, (1972). 2 fig, 1 tab, 16 ref.

Descriptors: *Hydrologic data, *Rainfall, *Simulation analysis, Precipitation, Summer, Poisson ratio, Computer programs, Probability, Mathematical models, Systems analysis, Methodology, Analytical techniques, *Risks.

Identifiers: *Bayesian methods.

In previous work by the co-authors, it was found that the return period of maximum point rainfall could be derived from the following event-based process valid for the summer precipitation season: (a) The number of events per season is Poisson distributed; (b) the amount of point rainfall per event may be exponentially distributed; and (c) the above two random variables are independent. The objective of this paper is (1) to obtain a correct distribution function of the return period when uncertainty arises in the parameters of the Poisson and exponential distributions and (2) to obtain the probability density function of the event corresponding to a given return period and that of the return period corresponding to a given event stemming from the same uncertainty. The methodology employs conjugate distribution for the Poisson and exponential distributions to permit direct computation of posterior distributions of rainfall amounts given point rainfall data. Computer simulation shows that errors in estimated return periods lead to underdesign even with 20 years of data (for the example used in this analysis). Extensions of the methods are possible to encompass effects of uncertainties in rainfall data samples on runoff estimates and associated economic factors. (See also W73-13134) (Bell-Cornell)

CLOUDINESS AS A GLOBAL CLIMATIC FEEDBACK MECHANISM: THE EFFECTS ON THE RADIATION BALANCE AND SURFACE TEMPERATURE OF VARIATIONS IN CLOUDINESS,
National Center for Atmospheric Research, Boulder, Colo.
S. H. Schneider.
Journal of the Atmospheric Sciences, Vol 29, No 8, p. 1413-1422, November 1972. 4 fig, 3 tab, 23 ref.

Descriptors: *Temperature, *Cloud cover, *Energy, *Solar radiation, Atmospheric physics, Cloud physics, Air temperature, Radiation, Clouds, Weather, Environmental effects, Infrared radiation, Model studies, Mathematical models, Climatology.

The effect of changes in cloudiness on the radiation balance was analyzed, using a simple atmospheric model in which cloud tops are regarded as a reflecting layer for solar radiation and as a blackbody radiator for the infrared atmospheric radiation. Calculations include the effect of variations in cloud top height. Local departures from the global-average results have been computed as a function of latitude. Global radiation balance calculations show that an increase in the amount of low and middle level cloud cover decreases the surface temperature. This result for the global-average case does not hold near polar regions, where the albedo of the cloudy areas can be comparable to (or even smaller than) the albedo of the snow-covered cloudless areas, and where, especially in the winter season, the amount of incoming solar radiation at high latitudes is much less than the global-average value of insolation. The exact latitude at which surface cooling changes to surface warming from a given increase in cloud cover depends critically on local values of the cloud albedo of the cloudless areas that are used in calculation. An increase in effective cloud top height increases surface temperature at all latitudes. (Jerome-Vanderbilt)

Descriptors: *Glaciers, *Glacial drift, *Surfaces, *Heat balance, *Summer, Heat flow, Temperature, Evaporation, Radiation, Meteorology, Ice, Curves, Equations.
Identifiers: USSR, *Abramov Glacier (USSR).

Radiation characteristics of ice and moraine surfaces were investigated in heat-balance studies on the Abramov Glacier in southwestern Kirgizia in July-August 1969. Large differences were observed in the values of all items in the heat balance of glacier and moraine surfaces. Radiation balance of the glacier for clear days in July averaged 303.5 cal/sq cm and that of the moraine was 368.4 cal/sq cm. A large portion of the glacier's total heat income (71.4% in July and 79.6% in August) is the radiation balance. For bare ice, heat losses to melting are considerably higher than heat losses to evaporation. For moraine, heat losses to evaporation predominate over other values in the total heat expenditure. Yu. N. Yemel'yanov, V. K. Nozdryukhin, and N. V. Petrov.
In: Glyatsiologiya Sredney Azii; Sredneaziatskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 65 (80), p 45-51, Leningrad, 1972. 2 fig, 3 tab, 2 ref.

Descriptors: *Glaciers, Snowpacks, Ice, Firn, Ablation, Water equivalent, Snow surveys, Altitude, Elevation, Curves.
Identifiers: USSR, *Abramov Glacier (USSR), *Glacier mass budget.

Accumulation and ablation of snow and ice on the Abramov Glacier in southwestern Kirgizia were

investigated in snow surveying performed in 1967-70. Glacier mass budget during the period was negative, as evidenced by a loss of mass equal to 200 m and by a drop in surface level of the glacier tongue averaging 6 m. Changes in glacier mass budget with altitude for the 1969-70 budget year are graphed, and tables show ablation of snow and ice at different elevations in 1970, as well as accumulation and ablation of snow and ice (in mm of water equivalent) at an elevation of 3,800 m in 1967-70. (See also W73-13350) (Josefson-USGS)

In: Glyatsiologiya Sredney Azii; Sredneaziatskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 65 (80), p 60-72, Leningrad, 1972. 3 fig, 2 tab, 21 ref.

Descriptors: *Glacial sediments, *Sediment yield, *Sediment transport, *Suspended load, Suspended solids, Suspension, Turbidity, Discharge (Water), Seasonal, Curves.
Identifiers: USSR, *Abramov Glacier (USSR), *Koksu River (USSR).

The amount of sediment transported in suspension by the Koksu River was investigated in 1968-70 after the framework of the International Hydrological Decade. Suspended load of the river 0.4 km below the terminus of the Abramov Glacier was 41,630 metric tons in 1968, 28,690 metric tons in 1969, and 81,480 metric tons in 1970. Water discharge of the river 69.4, 58.8, and 80.7 million cu m, respectively. (See also W73-13350) (Josefson-USGS)
W73-13355

RADAR SOUNDING OF THE ABRAMOV GLACIER (RADIOLOKATSIONNOYE ZONDIROVANIYE LEDNIKA ABRAMOVA),

In: Glyatsiologiya Sredney Azii; Sredneaziatskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 65 (80), p 73-83, Leningrad, 1972. 4 fig 1 tab, 5 ref.

Descriptors: *Glaciers, *Analytical techniques, *Measurement, *Sounding, *Radar, Antennas, Instrumentation, Profiles.
Identifiers: USSR, *Abramov Glacier (USSR).

Results are presented of radar measurements of ice thickness of the Abramov Glacier in southwestern Kirgizia in the summer of 1970. Soundings were made with standard radar altimeters operating at a frequency of 440 mc. Ice thickness of the glacier was measured at 119 points over an area of 15 km. Maximum thickness of the ice was 170 m. Methods of investigation and possibilities of using radar as a sounding technique are discussed. (See also W73-13350) (Josefson-USGS)

AVERAGE ALBEDO VALUES OF GLACIERS DURING THE ABLATION SEASON (O SREDNIKH ZNACHENIYAKH AL'BEDO LEDNIKOV V PERIOD ABLYATSII),
Sredneaziatskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Tashkent (USSR).
V. G. Konovalov.
In: Glyatsiologiya Sredney Azii; Sredneaziatskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 65 (80), p 111-122, Leningrad, 1972. 1 fig, 5 tab, 11 ref.

Descriptors: *Glaciers, *Ablation, *Albedo, Snowpacks, Ice, Firn, Surfaces, Cloud cover, Statistical methods, Estimating, Measurement, Variability, Equations.
Identifiers: USSR.

Data are presented on field measurements of albedo (in percent) on mountain glaciers of the world during the ablation season. Average albedo values are obtained for seven different types of glacier surfaces, and estimates are made of the reliability of these values. Results of a statistical analysis of albedo measurements on the Raygorodskiy Glacier in 1968 and on the Ayutor-2 Glacier in 1969 are tabulated, and quantitative characteristics are derived for the effects of cloudy conditions on reflective properties of a glacier surface. L. G. Cherkasov, V. P. Fateyev, and Yu. P. Barbat.
In: Glyatsiologiya Sredney Azii; Sredneaziatskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 65 (80), p 123-130, Leningrad, 1972. 2 tab, 8 ref.

Descriptors: *Glaciology, *Glaciers, *River basins, Mountains, Streams, Size, Shape.
Identifiers: USSR, *Naryn River (USSR).

New data on modern glaciers in the Naryn River basin in Kirgizia are based on on-site investigations in 1963-69, recent large-scale topographic maps, and aerial photographic surveys. In the river basin there are 2,074 glaciers, covering an area of 1,357.8 sq km. Glaciers are divided into three categories on the basis of size: (1) large glaciers (3-5 sq km or more), covering 36% of the glacier area of the basin; (2) medium-size glaciers (1-3 sq km), occupying 31% of the glacier area; and (3) small glaciers (smaller than 1.0 sq km), covering one-third of the glacier area. Occurring as independent and isolated sheets, glaciers are classified by shape as hanging, corrie, and valley glaciers. The firn line varies in height from 3,520 m in the west to 4,400 m in the east. DESCRIPTION OF GLACIER RECESSION IN THE AMU-DAR'YA RIVER BASIN FROM AERIAL PHOTOGRAPHIC SURVEY DATA FOR 1946-66 (KHARAKTERISTIKA OTSTUPANIYA LEDNIKOV BASSEYNA R. AMUDAR'I PO MATERIALAM AEROFOTOS'YEMKI 1946--1966 GG.),
Sredneaziatskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Tashkent (USSR).
V. I. Ratsek.
In: Glyatsiologiya Sredney Azii; Sredneaziatskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 65 (80), p 131-137, Leningrad, 1972. 1 fig, 4 tab, 10 ref.

Descriptors: *Glaciology, *Glaciers, *River basins, *Aerial photography, Mountains, Ice.
Identifiers: USSR, *Amu-Dar'ya River (USSR), *Glacier recession.

Glacier evolution was investigated in aerial photographic surveys performed in the glacierized zone of the Pamir-Alay mountain chain in 1946-66. Eight percent or 580 sq km of the glacier area in the Soviet part of the Amu-Dar'ya basin is currently in recession, which agrees with data for Central Tien Shan in the Akshiyrak basin, where about 10% of the glacier area is dead ice. Between 1946 and 1966 the area of the Lenin and Yazgulemdar Glaciers was reduced 0.8%. Assuming climatic conditions remain the same, 8% of the glacier area in the Amu-Dar'ya basin, equaling 11,700 sq km or 930 cu km of ice, may disappear in 200 years. The problem of glacier recession must be considered in terms of ice-melt and runoff fluctuations in preparing plans for the utilization of water and land resources in Soviet Central Asia. MONITORING SNOW WATER EQUIVALENT BY USING NATURAL SOIL RADIOACTIVITY,
National Weather Service, Silver Spring, Md
V. C. Bissell, and E. L. Peck.
Water Resources Research, Vol 9, No 4, p 885-890, August 1973. 5 fig, 6 ref.

Descriptors: *Snow cover, *Snowpacks, *Snow surveys, *Water equivalent, *Nuclear moisture meters, *Vermont, Radioactivity techniques, Gamma rays.
Identifiers: Sleepers River experimental watershed (Vt).

The attenuation by snow cover of natural gamma radiation emitted from the soil serves as an excellent index to the water equivalent of the snow cover. A small portable gamma ray detector was installed on a boom about 2 meters above the ground at Sleepers River watershed near Danville, Vermont. Comparison of gamma ray count with snow measurements indicates that the small unshielded gage could be used to measure snow water equivalent with a standard error of 1.5 cm. A major source of error was the deposition of radioactive aerosols on the snow surface by precipitation. The deviation of gamma ray count rates due to precipitation events is short-lived, and a simple editing procedure on the count rate time trace reduced the snow season standard error to 1.1 cm. The edited count rate yielded 6% error in the 5- to 13-cm water equivalent range, decreasing to 4% in the 25- to 40-cm water equivalent range. This measurement method could be extremely valuable in providing unmanned measurement of snow water equivalents at remote locations. (Knapp-USGS)

PHYSIOLOGY OF DAILY TRANSPIRATION RHYTHM IN WOODY PLANTS,
T. M. Khashes.
Ekologiya. Vol 2, No 6, p 28-32, 1971. Illus.
Identifiers: Acacia, Ash, Carbohydrates, Daily, Oak, Plant physiology, Poplar, Potassium, Sophora, *Transpiration, Willow, *Woody plants.

Comparative studies were made of different forest margins from 1967-69 to relate differences in daily transpiration rhythm to the physiological condition of the leaves. The objects were 17-18 yr old poplar, willow, acacia, sophora and oak trees in shelter-belts and along irrigation canals. Transpiration, ash, K and carbohydrate contents, and the content of total, free and bound water were determined. A correlation between the midday fall in transpiration intensity and daily dynamics of free

and bound water, assimilation products and mineral composition of the leaves was shown. This physiological regulatory mechanism decreased transpiration loss and guaranteed the normal course of biochemical processes under changing growing conditions.--Copyright 1973, Biological Abstracts, Inc.

POTENTIAL EVAPORATION FROM PASTURE AND POTATOES AT ASPENDALE,
Commonwealth Scientific and Industrial Research Organization, Aspendale (Australia). Div. of Atmospheric Physics.
A. C. Dilley, and W. Shepherd.
Agric Meteorol. Vol 10, No 4/5, p 283-300, 1972. Illus.
Identifiers: *Australia (Aspendale), *Evaporation rates, Pasture, *Potatoes.

Evaporation rates associated with well-watered pasture, potato crops and bare soil at Aspendale, Australia, and environmental and biological factors which influence them, were examined in analyses based on a formula of the combination type. Ratios of potato and soil to pasture evaporation were 1.27 and 1.17, respectively. A decrease of pasture evaporation relative to pan evaporation of 19% over a 9-yr period is attributed to progressive changes of pasture composition. Increased medium-scale advection to the experimental area accompanied changes in the surroundings occurring over the period. Linear empirical relationships were derived relating measured evaporation from the vegetated and bare soil surfaces to that from a Class A water pan and to values computed by means of the combination formula. The correlation coefficients for grass and soil evaporation were >0.97. Those for potatoes were 0.94 and 0.90, for pan and computed evaporation, respectively. The correlations confirm the suitability of both the combination method and the Class A pan for estimating evaporation under conditions of generous watering. The lower correlations with potatoes are attributed to the more variable nature of the surface involved and to the greater sensitivity of potatoes to minor restriction of water supply.--Copyright 1973, Biological Abstracts, Inc.

NETWORK DENSITY OF TEMPERATURE PROFILE STATIONS AND ITS INFLUENCE ON THE ACCURACY OF LAKE EVAPORATION CALCULATIONS,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
F. R. Crow, and S. D. Hottman.
Water Resources Research, Vol 9, No 4, p 895-899, August 1973. 3 fig, 2 tab, 4 ref. USBR Contract 14-06-D-5629.

Descriptors: *Evaporation, *Lakes, *Data collections, Oklahoma, Reservoir evaporation, Meteorology, Water temperature, Gaging stations, Statistical methods, Network design.
Identifiers: Lake Hefner (Okla).

The accuracy of lake evaporation determined by the energy budget method depends on the precision of measurement of the total thermal energy content of the lake, which in turn is related to the number and distribution of the temperature-measuring points. The number of sampling points to be used should be such that the error in the stored thermal energy is of the same magnitude as the error in the other terms in the energy budget. This problem was studied at Lake Hefner, a 2600-acre off-stream reservoir at Oklahoma City, Oklahoma. Ten evaporation periods of 1-week duration each were included. Stored thermal energy was calculated on the basis of temperature profiles taken at 5-foot depth increments at 19 locations uniformly spaced over the lake. Evaporation was determined by the energy budget method using stored thermal energy calculated on the basis of 1, 5, 11, or 19 temperature profile stations. Analysis showed the optimum number of stations to be 5, or one station per 520 acres. Using only one station resulted in an evaporation error of 8.2% at the deepest point of the lake. Increasing the number of stations from 5 to 19 resulted in an increase of accuracy of evaporation measurement of only 1%. (Knapp-USGS)

STUDIES ON THE TEMPERATURE AND WATER BALANCE OF CHOSEN PLANT SPECIES OF THE DRY AREA OF SANTA MARTA (COLOMBIA), (IN SPANISH),
Universidad Nacional de Colombia, Bogota.
R. Schnetter.
Beitr Biol Pflanz. Vol 47, No 2, p 155-213. 1971. Illus. English summary.
Identifiers: *Colombia (Santa Marta), Cucumis-Anguria, Heat resistance (Plants), Prosopis-Juliflora, Seasonality, Species, Stylosanthes-Hamata, *Temperature balance, *Transpiration, Tribulus-Cistoides, *Water balance.

Ecological studies were carried out at 2 observation sites (cactus thorn scrub, clearing of a semideciduous tropical lowland forest) in the xerophytic region of Santa Marta, Columbia. The temperatures, transpiration, water contents, and heat resistances of leaves from several plant species were studied. During the wet season, and on the clearing of the semideciduous lowland forest with its more favorable water conditions also during the dry season, the leaf temperatures generally reached about 35C at noon; only rarely temperatures higher than 40C were observed. The leaf temperatures of smaller plants (Cucumis anguria, Stylosanthes hamata, Tribulus cistoides) often were lower than the temperature of the air in their environment near the ground (up to 5C). Lower water contents of leaves caused by the water stress in the dry season were correlated with reduced transpiration rates and elevated transpiration resistances (Prosopis juliflora and Tribulus in the cactus thorn scrub). Under these conditions, the leaves of Tribulus reached temperatures as high as 53C causing heat damage. Some examples for the energy exchange between leaves and environment are discussed.--Copyright 1973, Biological Abstracts, Inc.

ON THE SIGNIFICANCE OF ANTITRANSPIRANTS FOR TROPICAL CULTIVATED PLANTS, (IN GERMAN),
Giessen Univ. (West Germany). Lehrstuhl Botank (II).
L. Steubing, R. Herrmann, and R. Michler.
Mitt Inst Colombo-Aleman Invest Cien Punta De Betin. 5. p 19-29. 1971. Illus. English summary.
Identifiers: *Antitranspirants, Cresopinol, Cultivated, Leaf, Manihot-Esculenta, Octodecanol, Phaseolus-Vulgaris, Temperature, Toxicity, Transpirants, Trifolium-Repens, Triton, Tropical plants, Water transport (Plants), *Foliar sprays.

The influence of different foliar sprays as antitranspirants (0.1-0.5% Octodecanol, 15% Triton, 10% Cresopinol, 1% oil emulsion) was tested on Trifolium repens, Phaseolus vulgaris and Manihot esculenta under field and greenhouse conditions. The water loss of these plants decreased considerably after application. A remarkable reduction of the speed of water transport in the stem was measured as well as decline of both transpiration and water deficit of the leaves. Decreases of leaf temperatures and porometer values were observed. Octodecanol was most efficient, follwed by Triton 500. A spray of oil caused infiltration and toxic effects; the same influences have been noted after application of Cresopinol, but somewhate less frequently.--Copyright 1973, Biological abstracts, Inc.

DIFFERENTIAL STOMATAL RESPONSE BETWEEN C3 AND C4 SPECIES TO ATMOSPHERIC CO2 CONCENTRATION AND LIGHT,
National Inst. of Agricultural Sciences, Konosu (Japan). Dept. of Plant Physiology and Genetics.
S. Akita, and D. N. Moss.
Crop Sci. Vol 12, No 6, p 789-793. 1972. Illus.
Identifiers: Amaranthus-Retroflexus, Atmospheric conditions, Barley, *Carbon dioxide, Dandelion, Differential, Foxtail, Hordeum-Vulgare, Light, Maize, Pigweed, Setaria-Viridis, Species, *Stomatal response, Taraxacum-Officinale, *Transpiration, Triticum-Aestivum, Wheat, Zea-Mays.

Transpiration measurements were made on attached leaves of potted plants or on excised leaves of native plants of 3 C3 species-wheat (Triticum aestivum L.), barley (Hordeum vulgare L.), and dandelion (Taraxacum officinale L.)--and 3 C4 species--maize (Zea mays L.), green foxtail (Setari viridis L.), and pigweed (Amaranthus retroflexus L.)--in different CO2 concentrations and light intensities. The experiments were begun with leaves in CO2-free air in light (0.4 cal/cm2/min, 400-700 nm) to open the stomata. Stomata of C3 species were less prone to closure than were stomata of C4 species as the light intensity was decreased or as the CO2 concentration was increased. The greater water use efficiency of C4 species may be due to part to the better control of water loss because the stomata are more responsive to environmental changes than are the stomata of C3 species.--Copyright 1973, Biological Abstracts, Inc.

A DIGITAL REGISTRATION SYSTEM FOR NET PHOTOSYNTHESIS AND TRANSPIRATION MEASUREMENTS IN THE FIELD AND AN ASSOCIATED ANALYSIS OF ERRORS,
Wuerzburg Univ. (West Germany). Botanisches Institut II.
E-D. Schulze, O. L. Lange, and G. Lembke.
Oecologia (Berl). Vol 10, No 2, p 151-166. 1972. Illus.
Identifiers: Digital systems, *Errors, *Field measurements, *Photosynthesis, *Transpiration.

A digital registration system used with temperature- and humidity-controlled cuvettes for net photosynthesis and transpiration measurements in the field is described. The associated errors of the measured parameters and calculated data are estimated. The digtalization is based on an analog registration which is of primary importance in the control of experimental conditions in the cuvettes. The digital system is connected to the analogue registration in series. The error associated with digitilization is 0.1% across 70% of the scale. This error increases to 0.2% between 3 and 30% on the scale due to a minor lack of linearity. The reproducibility of the digitalization is plus or minus 0.024%. The error associated with data transfer in the digitalization and the errors of the analog registration are estimated for temperature and humidity measurements (error of air and leaf temperature is plus or minus 0.1C; error of the dew point temperature is plus or minus 1.1C dew point). The effect of these errors on the calculation of relative humidity and the water vapor difference between the leaf and the air is determined using the progressive error law. At 30C and 50% relative humidity, the error in relative humidity is plus or minus 7.4%, the error for the water vapor difference is plus or minus 6.6%. The dependence of these errors on temperature and humidity is shown. The instrument error of the net photosynthesis measurement is calculated to be plus or minus 4.2%. Transpiration measurements have an average inaccuracy of plus or minus 8.3%. The total diffusion resistance which is calculated from values of transpiration and the water vapor difference has an average of plus or minus 10.9%. The sizable influence of errors in humidity and temperature measurements on the calculated diffusion resistance is demonstrated. The additional influence of biological errors associated with field measurements is discussed.--Copyright 1973, Biological Abstracts, Inc.

A BATTERY DRIVEN MEASURING APPARATUS FOR THE ELECTRICAL REGISTRATION OF EVAPORATION OR DEWFALL, (IN GERMAN),
Innsbruck Univ. (Austria). Institut Allgemeine Botanik.
A. Cernusca, and G. Cernusca.
Centralbl Gesamte Forstwes. Vol 89, No 2, p 61-74, 1972. Illus. English summary.
Identifiers: Computers, *Dewfall, Driven, Economy, Ecosystem, Electrical measurement, *Evaporation, *Evaporimeter, Temperature, Measurement, Weather, Plant physiology, Instrumentation.

A battery driven evaporimeter was developed which was applicable to any electric registration device as strip card recorders, electric event counters, printers, tape punches or desk computers. With this evaporimeter synchronous registration of evaporation and other meteorological and ecophysical parameters of the environment, as well as certain ecophysiological parameters can be carried out. Thus it constitutes a basis for causal analytic investigations of plant water economy and productivity and for other problems in the applied biology. Construction and operation of the evaporimeter were tested estensively. The calibration factor of the evaporimeter depends not only upon the various parameters of the device but also upon the temperature. Long term measurements carried out in difficult mountainous terrain determined adaptability of the device in ecosystem analyses and stability under severe weather conditions.--Copyright 1973, Biological Abstracts, Inc.

In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 661-676, (1972). 3 fig, 6 tab, 5 ref.

Descriptors: Hydrology, *Mathematical models, *Remote sensing, *Streamflow forecasting, *Tennessee River, *Watersheds (Basins), *Computer programs, Optimization, Simulation analysis, Feasibility, Calibration, Climatic data, Hydrologic data, Synthetic hydrology, Parametric hydrology.
Identifiers: Prediction, Sensitivity analysis, Historical data.

Progress and initial results in the first major part of a stream flow forecasting project, utilizing aircraft (and later space) derived imagery for watersheds of the Tennessee River Valley, are presented. The initial study phase, aimed at assessing the feasibility of applying remote sensing data to prediction of watershed performance, is approximately 30 percent complete. Demonstration of feasibility will lead to a means of prediction of the hydrological behavior of ungaged watersheds using remote sensed data to minimize time, effort, and cost of achieving these predictions. The watersheds chosen for calibration and simulation provide a wealth of climatological and streamflow historical data and aerial photographic and ground survey coverage. A computer program based on the Stanford Watershed Model IV and a companion parameter-optimization program are used to calibrate model parameters for the selected catchments, based on historical data. The accuracy of the models is shown by comparison of synthesized with observed streamflows. Sensitivity of the model's simulation results to variations in its model parameters has been analyzed for two watersheds. Methods of determining model parameters from physical characteristics observable or inferable from remotely acquired photographs, without the necessity of historical streamflow data, are discussed. Identifiers: *Dynamic flood routing.

Prediction of transient flow in a river having a major tributary poses a problem for the streamflow forecaster. The interaction of storage and dynamic effects between the two rivers can be simulated efficiently by a mathematical model consisting of the two unsteady flow differential equations and of known stage time, discharge time, or stage-discharge relationships at the extremities of the rivers. Numerical solutions of discharge and water surface elevation are obtained from the differential equations at specified time intervals by an implicit finite difference technique. This produces successive systems of nonlinear equations that are efficiently solved by the Newton-Raphson iterative method in combination with an extrapolation procedure and a specialized direct method for solving a system of linear equations. The length of the specified time interval is not limited by computational stability; however, accuracy constraints may limit its size. Some numerical results are presented to illustrate the interaction between a river and a tributary when they are subjected to a flood wave of long duration. (Knapp-USGS)

REGULAR MEANDER PATH MODELS,
Hull Univ. (England). Dept. of Geography.
R. I. Ferguson.
Water Resources Research, Vol 9, No 4, p 1079-1086, August 1973. 6 fig, 1 tab, 14 ref.

Descriptors: *Meanders, *Mathematical studies, *Mathematical models, Alluvial channels.
Identifiers: Topology.

Existing mathematical models for regular meander paths are shown to be members of a general family of differential equations in which the rate of change of curvature along the channel is an odd function of path direction and bends are symmetric. The physical assumptions of the general model and possible justifications of the particular cases are outlined. Each model is specified by one scale parameter (path or axial wavelength) and one shape parameter (maximum deviation, sinuosity, or maximum curvature). Exact analytic expressions for geometric properties of circular arcs, Fargue's spiral, Von Schelling's curve, and the sine-generated curve are presented and illustrated by dimensionless plots; the last three models are generally similar. Properties of natural meander bends show fair agreement with these three regular models, although bend size and shape vary along individual channels, possibly because of nonuniform floodplain topography and sediments. NAVIFACIAL TEMPERATURE AND SALINITY ALONG THE TRACK FROM SAMOA TO HAWAII, 1957-1965,
Stevens Inst. of Technology, Hoboken, N.J.
R. I. Hires, and R. B. Montgomery.
Journal of Marine Research, Vol 30, No 2, p 177-200, 1972. 10 fig, 30 ref.

Descriptors: *Ocean circulation, *Temperature, *Seasonal, *Heat flow, *Salinity, Oceanography, Ocean currents, Pacific Ocean, Thermocline, Thermodynamics, Isotherms, Sea water, Tropical regions, Data collections, Evaluation, Geophysics.
Identifiers: Transequatorial voyages, Pago Pago, Hawaii.

Data were collected by ships on the temperature and salinity of intake water from measurements taken every 4 hours on 78 transequatorial voyages between Pago Pago (14S 171W) and Honolulu (21N 158W) over a period of nine years. This time series of systematic measurements permits reliable estimates of certain climatological features. Anomalous conditions appear clearly in specific years. Navifacial temperature is portrayed by isotherms on a graph with latitude and time as coordinates, and navifacial salinity is portrayed by isohalines on a similar graph. Anomalously high temperatures, especially within 5 degrees of the equator, occurred during parts of the years 1957-1959 and 1963-1965. Mean annual variations also are portrayed against latitude. Of special interest, the equatorial thermal minimum is found to be lowest twice a year in Feburary and September, and some evidence is found that this double cycle is related to the strength of the trade winds near the equator. Salinity and precipitation are compared with each other in their variations with latitude and season; the results are inconclusive. (Jerome - Vanderbilt)

WARM WATER ADVECTION IN THE SOUTHERN BEAUFORT SEA AUGUST-SEPTEMBER 1971,
Coast Guard Washington, D.C. Oceanographic Unit.
G. L. Hufford.
Journal of Geophysical Research, Vol 78, No 15, p 2702-2707, May 1973. 5 fig, 14 ref.

Descriptors: *Ocean currents, *Seasonal, *Heated water, *Advection, Oceanography, Ocean circulation, Summer, Pacific coast region, Temperature, Salinity, Density, Stratified flow, Thermal stratification.
Identifiers: *Beaufort Sea.

Oceanographic features of the Southern Beaufort Sea were studied during August-September 1971. The data indicated the presence of a relatively warm layer (0.1-5.0C) in the continental shelf waters. This situation has only been reported once previously. The layer averaging 25 meters in thickness was traced from 154 degrees 30 minutes west to 143 degrees 42 minutes west. The layer decreased in temperature toward the east but salinity remained relatively constant. Direct current measurements in the warm water layer indicate an eastward flow, suggesting a Bering Sea-Chukchi Sea origin. This hypothesis was supported by a water mass analysis. Investigation of available data indicated the presence of the warm water layer in the Southern Beaufort Sea during the summer in 10 of the 16 years examined. (Jerome - Vanderbilt)

MEASUREMENT OF GROUNDWATER FLOW USING AN IN-SITU THERMAL PROBE,
New Mexico Inst. of Mining and Technology, Socorro. Dept. of Geoscience.
M. A. Reiter, and A. R. Sanford.
Available from the National Technical Information Service as PB-222 465, $3.00 in paper copy, $1.45 in microfiche. New Mexico Water Resources Research Institute Las Cruces Technical Completion Report No 027, 1973. 31 p, 4 tab, 11 fig, 2 ref. OWRR A-042-NMEX (1).

Descriptors: *Groundwater movement, *Thermal conductivity, Geophysics, Hydrogeology, Aquifers, *Boreholes, New Mexico, *Base flow, Measurement, Water temperature, Instrumentation, Testing.
Identifiers: *Thermal probe, *Groundwater flow measurement, Well geometrics, Cased borehole, Uncased borehole.

A thermal probe for the in-situ measurement of groundwater flow in a borehole was constructed and calibrated in a horizontal position. The probe is a long slender metal rod having a heat source along its entire length and a temperature sensor at its midpoint. When a constant quantity of heat is applied to the probe, the rise in temperature is inversely related to the rate of water flow past the probe. Full-scale calibration of the probe was considered necessary because theoretical studies oversimplify the interaction between the heated probe and the horizontal flow of groundwater. The apparatus for calibration consists of a central sand-filled chamber having a horizontal hole lined with well-screen in its center. The central chamber is hydrologically connected to two taller water-filled chambers that are used to control the rate of water flow. Over 40 calibrations of the thermal probe were made, but most of these tests were used to perfect experimental techniques. However, 8 of the calibration runs were considered sufficiently accurate to construct preliminary Master Curves. These curves indicate that if temperature differences of 0.1 degree Centrigade can be measured at the end of a two hour test, the probe is capable of distinguishing changes in rate of water flow of 0.0005 cucm/sec/sq/cm. Geological Survey, Iowa City, Iowa.
L. K. Kuiper.
Water Resources Research, Vol 9, No 4, p 1094-1097, August 1973. 1 fig, 4 ref.

Descriptors: *Mathematical studies, *Groundwater movement, Numerical analysis, Finite element analysis.

The Galerkin procedure, when it is applied to the equation for horizontal two-dimensional flow of groundwater in a nonhomogeneous isotropic aquifer, generates approximating equations involving square matrices and column matrices. An analytic solution to the matrix equation is given. These methods are compared with the approximate numerical Crank-Nicholson procedure by applying both to a particular problem for which the unknown column matrix has 49 elements. The Crank-Nicholson procedure usually requires less computation time for the confined aquifer case but gives errors for drawdown averaging approximately 10%. The Crank-Nicholson procedure takes considerably more computation time for the unconfined case when elapsed time is long. (Knapp-USGS)

Tritiated molecular hydrogen in the atmosphere is oxidized by soil microorganisms and may contribute to the T input into soil with a rate of 5.4 T atom per sq cm per sec. Thus groundwater studies using HTO as a tracer should take this additional T input into account, and measurements of the uptake of HT by local soil, along with the T deposition by rain, may be required to give correct results. EFFECT OF ACCRETION ON DYNAMICS OF GROUNDWATER BETWEEN TWO CHANNELS,
Slovenska Akademie Vied, Bratislava (Czechoslovakia). Ustav Hydrologie a Hydrauliky.
A. El Nimr.
Water Resources Research, Vol 9, No 4, p 1058-1064, August 1973. 6 fig, 5 ref.

Descriptors: *Groundwater movement, *Surface-groundwater relationships, *Mathematical studies, Recharge, Evapotranspiration, Water balance, Infiltration, Evaporation, Seepage.

The effects of infiltration and evaporation on groundwater level and on the amount of seepage to or from channels that bound an unconfined aquifer were studied mathematically. The actual free-surface boundary conditions as well as the exact differential equation were used to obtain the general solution. Three particular cases were studied in detail. In the first, the accretion is considered to be constant, whereas, in the second, it is considered to vary linearly with time. In the third, the accretion occurs only on a part of the aquifer but does not occur on the other parts. For the three cases, the rate of seepage is given in mathematical forms as well as in dimensionless curves. The free-surface profile was also drawn for several cases. A comparison with the solutions based on the Boussinesq equation is presented. These approximate solutions give satisfactory results for shallow aquifers but fail to give reasonably adequate results for relatively thick aquifers. The results of these approximate methods deviate greatly from the exact solutions for small values of time. (Knapp-USGS)

S. P. Gupta, J. E. Varnon, and R. A. Greenkorn.
Water Resources Research, Vol 9, No 4, p 1039-1046, August 1973. 8 fig, 1 tab, 14 ref.

Descriptors: *Model studies, *Infiltration, *Hydraulic models, *Porous media, Oil-water interfaces, Mixing, Saline water intrusion.
Identifiers: *Hele-Shaw models, Multiphase flow.

The displacement of one fluid by another (miscible or immiscible) in porous media is an important phenomenon that occurs in groundwater movement and oil reservoir engineering. Practical examples are water flooding, solvent flooding, saltwater intrusion into coastal aquifers, and coning. Viscous fingering was studied in Hele-Shaw models. For an immiscible displacement, dispersive and relative permeability phenomena are absent. The investigation covered the entire scope of finger development from the incipient fingers predicted by Chuoke's theory to a parallel-sided single finger. Results of several experiments run in a Hele-Shaw cell with and without local heterogeneities show wavelength degeneration to one finger for different flow conditions and for different initial numbers of fingers. It was also found that the rate of growth develops almost immediately, well before the fingers are parallel sided. The mechanisms of wavelength generation and degeneration are discussed. (Knapp-USGS)

MODIFIED MONTE CARLO APPLICATION TO GROUNDWATER MOVEMENT--THE SIMULTANEITY PROCEDURES,
Central and Southern Florida Flood Control District, West Palm Beach.
S-F. Shih.
Water Resources Research, Vol 9, No 4, p 1029-1038, August 1973. 4 fig, 6 tab, 11 ref.

Descriptors: *Groundwater movement, *Monte Carlo method, *Mathematical studies, Soil water movement, Statistical methods, Computers, Drawdown, Computer programs.
Identifiers: Simultaneity procedures.

By applying the Monte Carlo methods to problems of water movement in soils, very difficult problems can often be treated easily, and solutions at only a few points in a flow system can be obtained independently. A modified Monte Carlo application, termed the simultaneity procedure, hastens the classical Monte Carlo application. So that the simultaneity procedure can be used more widely, the techniques of a parallel simultaneity procedure and a successive simultaneity procedure were devised. Examples are presented not only for the problems of groundwater movement and Thiessen coefficients but also for the problems of general mathematics. Comparisons of results indicate that the simultaneity procedure has the same accuracy as the classical Monte Carlo method, but the computing time is reduced by approximately 30%-60%. (Knapp-USGS)

EQUATION FOR ONE-DIMENSIONAL VERTICAL FLOW OF GROUNDWATER: 1. THE RIGOROUS THEORY,
Centro di Ricerca IBM di Venezia (Italy).
G. Gambolati.
Water Resources Research, Vol 9, No 4, p 1022-1028, August 1973. 14 ref.

Descriptors: *Groundwater movement, *Mathematical studies, *Unsteady flow, Porous media, Deformation, Equations, Elastic deformation, Elastic theory, Hydraulic conductivity, Saturated flow, Stress, Strain.

A new mathematical derivation of the one-dimensional flow equation in an elastic, saturated, porous medium is presented. The approach involves the consideration of a fixed elemental volume in fixed coordinates. The derivation is developed by starting from both Lagrangian and Eulerian definitions of the position vector. The Lagrangian and Eulerian formulations prove to be equivalent and provide the same outcome if they are correctly interpreted and consistently applied. The rigorous equation contains an additional nonlinearity resulting from the correct expansion of the partial spatial derivative of the grain velocity. It is also shown that an approach based on a deforming element in fixed coordinates is simple and straightforward, since it does not introduce the grain velocity into the development. However, it needs a particular definition for the compressibility different from the classical one. It is proved that these two compressibilities are not equal; their mathematical link is derived. (Knapp-USGS)

INTEGRODIFFERENTIAL EQUATIONS FOR SYSTEMS OF LEAKY AQUIFERS AND APPLICATIONS: 1. THE NATURE OF APPROXIMATE THEORIES,
Universidad Nacional Autonoma de Mexico, Mexico City. Instituto de Geofisica.
I. Herrera, and L. Rodarte.
Water Resources Research, Vol 9, No 4, p 995-1005, August 1973. 4 fig, 27 ref.

Descriptors: *Groundwater movement, *Mathematical studies, *Equations, Aquifer characteristics, Aquicludes, Hydrogeology.
Identifiers: *Leaky aquifers.

The dynamics of leaky aquifers are described by a system of integrodifferential equations. Alternative expressions for the memory functions are obtained, and it is shown that approximate theories of leaky aquifers correspond to several ways of approximating the memory functions. By means of analysis of these functions in the time domain it is possible to achieve a better understanding of the nature of these approximations as well as to foresee the possibility of their application to new situations. These types of results constitute important steps toward making the integrodifferential equations a powerful method of analysis of the very complex situations arising in the study of actual leaky aquifer systems. They can also be used to construct improved, simplified methods for numerical computation. (Knapp-USGS)
W73-13378

EFFECT OF SOLUTE DISPERSION ON THERMAL CONVENTION IN A POROUS MEDIUM LAYER,
Technion-Israel Inst. of Tech., Haifa. Dept. of Civil Engineering.
H. Rubin.
Water Resources Research, Vol 9, No 4, p 968-974, August 1973. 2 fig, 9 ref.

Descriptors: *Convection, *Dispersion, *Groundwater movement, *Saline water intrusion, Mixing, Mathematical studies, Water temperature, Salinity, Steady flow, Unsteady flow.

Thermal convection may sometimes play an important role in salt diffusion in an aquifer. In such cases hot saline water is in the deep layers of the aquifer, from which salt diffuses into the upper freshwater. Often the horizontal steady flow of the water in the aquifer increases the rate of diffusion of solutes. Salt diffusion is then characterized by the anisotropic dispersion tensor. Dispersion of the solutes reduces the stabilizing effect of the salinity profile but increases the stability of the flow field to pure overstable motions. Dispersion also changes the dimensions of Benard cells in the porous medium. Fluctuations of the dispersion tensor affect the stability criteria of the flow field but cause very small overstable motions that distort the convective current cells. (Knapp-USGS)

GROUNDWATER HYDROLOGY OF PRAIRIE POTHOLES IN NORTH DAKOTA,
Geological Survey, Washington, D.C.
C. E. Sloan.
Available from GPO, Washington, D C 20402 Price $0.70. Geological Survey Professional Paper 585-C, 1972. 28 p, 22 fig, 2 plate, 1 photo, 7 tab, 29 ref.

Descriptors: *Hydrogeology, *Surface-groundwater relationships, *Grasslands, *Lakes, Playas, Glacial drift, Water balance, Evapotranspiration, Groundwater movement, Salinity, Water table, *North Dakota.
Identifiers: *Prairie potholes.

Prairie potholes are water-holding depressions of glacial origin in the prairies of the Northern United States and southern Canada. Because potholes generally do not overflow, seepage outflow is the principal way in which dissolved salts can be removed. Salinity of pothole water is therefore a good indication of the seepage balance. Net seepage outflow results in fresh to brackish waters that constitute ephemeral to semipermanent ponds, whereas net seepage inflow results in brackish to saline waters that constitute semipermanent to permanent ponds. Because the water table in the glacial deposits is continuous with the water surface in prairie potholes, the water-table gradient is adjusted to the water-surface elevation of the potholes. Groundwater flows toward the pothole if the adjacent water table is higher than the pothole water surface and flows away from the pothole if the adjacent water table is lower than the pothole water surface. Prairie potholes were studied in North Dakota on the Coteau du Missouri, an area of stagnation moraine. Because joints in glacial till are most numerous near the land surface (owing to weathering effects), the most active groundwater flow systems are shallow and localized in the vicinity of potholes. As a result, local groundwater flow systems have a noticeable effect on pothole hydrology, particularly the salinity. (Knapp-USGS)

WATER RESOURCES AND GEOLOGY OF MOUNT RUSHMORE NATIONAL MEMORIAL, SOUTH DAKOTA,
Geological Survey, Washington, D.C.
J. E. Powell, J. J. Norton, and D. G. Adolphson.
Available from GPO, Washington, D.C. 20402 Price $1.25. Water-Supply Paper 1865, 1973. 50 p, 9 fig, 1 plate, 3 tab, 20 ref.

Descriptors: *Groundwater resources, *Water supply, *National parks, Geology, Hydrogeology, Joints (Geologic), National monuments, Alluvium, Aquifers, *South Dakota.
Identifiers: *Mt. Rushmore National Memorial (S. Dak).

Groundwater suitable for public supply can be obtained from fractured metamorphic and igneous rocks at Mount Rushmore National Memorial, S. Dak. Mica schist is the most abundant rock in the memorial. The more prominent hills and mountains, however, are in large, northerly striking granite sills, some of which are several hundred feet thick. Pegmatite sills and dikes are also numerous. At some locations in the memorial, granite or pegmatite sills act as groundwater dams preventing the movement of groundwater down gradient. The occurrence of groundwater is dependent upon the presence of joints and fractures in the schist and granite bedrock. The rocks themselves are relatively impermeable and would yield little or no water in their unaltered state. Groundwater is also available from alluvium in major valleys such as Starling basin and the valleys of Grizzly Bear Creek and Battle Creek. Several locations in the memorial have potential as future sources of groundwater supplies. Developed and potential water resources in the memorial probably are sufficient to meet demands beyond the year 2000. (Knapp-USGS)

SUBSIDENCE OF THE VENICE AREA DURING THE PAST 40,000 YR,
Laboratoire de Geologie Dynamique, Paris (France).
J. Ch. Fontes, and G. Bortolami.
Nature, Vol 244, No 5415, p 339-341, August 10, 1973. 2 fig, 16 ref.

Descriptors: *Land subsidence, *Withdrawal, *Drawdown, *Paleohydrology, Radioactive dating, Sedimentation, Stratigraphy, Carbon radioisotopes.
Identifiers: *Venice (Italy).

Subsidence of the Quaternary deposits of the plain of Venice may be the result of geological factors or of human activity over several centuries, such as overexploitation in the confined aquifers and urban and industrial development on unconsolidated sediments. The respective contribution of the factors affecting subsidence may vary from place to place. Drilling, continuous coring, and seismic profiles provide average sedimentation rates of about 0.5 to 1.0 mm per yr since the Upper Pliocene. Geodesic studies, available since the early 1900's show that in some places the surface is now sinking at a velocity close to 8 mm per yr. In order to study the geological component of subsidence at an intermediary time scale, systematic analysis of the chronology of the upper Quaternary deposits was undertaken using C-14 measurements. From about 40,000 to 22,000 yr BP the correlation between age and depth is linear. The slope is about 1.2 mm per yr. Between 22,000 and 18,000 yr BP a high sedimentation rate (about 4 mm per yr) produced at least 17 m of deposits. The rate of marine deposition decreased between 5,900 and 2,020 yr BP. The beginning of human settlement in the area seems to have coincided with a period of ground stability. (Knapp-USGS)

TRANSIENT VIBRATION TECHNIQUES TO DETERMINE WAVE VELOCITIES IN-SITU,
Kentucky Univ., Lexington. Dept. of Civil Engineering.
D. Raghu.
M Sc Thesis, 1972. 215 p, 23 fig, 6 tab, 67 ref, 11 append. OWRR A-026-KY (2).

Descriptors: *Seismic studies, *Seismic properties, *Soil dynamics, *Foundation investigations, *Seismic waves, Exploration, Soil physical properties, Soil investigations.
Identifiers: Seismic wave velocities.

Seismic velocity profiling was tested at two sites by two seismic refraction methods, the sledge hammer method and the crosshole shooting method. Reliable measurements of shear wave velocity in field could be made from crosshole shooting data, provided data were interpreted properly. A new method to determine R-wave velocities uses the data from the sledge hammer method. A procedure is outlined for conducting crosshole shooting. In the Laboratory, resonant column tests were run to determine shear wave velocities for the two test sites. The laboratory and field shear wave velocities were correlated by taking into account the sample disturbance and time effects. (Knapp-USGS)

A STOCHASTIC MODEL FOR THE OCCURRENCE OF MOISTURE IN VADOSE MEDIA,
Clemson Univ., S.C.
H-Ih. Chien.
PhD Thesis, August 1972. 138 p, 41 tab, 88 equ, 151 ref, append. OWRR-A-014-SC (4) and A-023-SC (3).

Descriptors: Hydrology, *Soil moisture, Behavior, *Simulation analysis, *Markiv processes, *Stochastic processes, *Model studies, *Rainfall-runoff relationships, Probability, Distributions, Predicting, Surface runoff, Storage, Deep percolation, Evapostranspiration, Precipitation, Digital computers, Optimization, Systems analysis.
Identifiers: *Vadose media, Vertical movements, Soil moisture losses.

Two- and six-state Markov chain models are developed to predict the periodic vertical distribution of moisture at the ground surface and within the layers of the soil profile. The probabilities of transition of moisture between the concerned states are estimated and generalized. Weekly data for the accumulated rainfall and surface runoff and the initial soil moisture storage were measured at the Clemson Research Watershed; the observed data (December 1965 through October 1969) are employed as the input of the proposed model. The associated transition probabilities are estimated and then optimized through a digital computer program based on theories of discrete stationary Markov chain and the maximum likelihood estimation. The predicted vertical distribution of moisture is found to approximate closely the actually observed distribution. The probabilities of losses of soil moisture due to deep percolation and evapotranspiration from various depths of the soil profile are determined. The probability of infiltration into the ground surface and the probability of evapotranspiration losses from the entire moisture storage are also estimated. These probabilities are useful in calculating the absolute amounts of deep percolation, evapotranspiration and infiltration, and in predicting the absolute amounts of moisture in soil layers. (Bell-Cornell)

STUDIES ON THE SOIL-WATER SYSTEM IN THE FIELD: II. STATISTICAL CONSIDERATION ON THE SOIL MOISTURE CONTENT (IN JAPANESE),
Utsunomiya Univ., Tochigi (Japan). Coll of Agriculture.
K. Soma.
Bull Coll Agric Utsunomiya Univ Vol 8, No 2, p 81-92, 1972. Illus. English summary
Identifiers: Distribution patterns, Moisture, Samples, Season, Size, *Soil moisture, Statistical methods, System.

In the soil layer of a lysimeter the distribution of moisture content is usually normal in 15 x 15 cm section sampling (n ± 36) but seems to be nonuniform in each layer. This was caused by compaction in the soil tank. The fluctuation of measured values is larger in the upper layers. If a risk ratio alpha ± 5% and an accuracy epsilon ± 5% are accepted, the necessary sampling number for estimating the population is about 10 for moisture content. The distribution of moisture content in whole year (n ± 254) is normal for every layer, but there is a fair difference between characteristics of these distributions. Soil moisture fluctuates more in summer than winter.—Copyright 1973, Biological Abstracts, Inc.

J Sediment Petrology. Vol 42, No 3, p 670-681. 1972. Illus.
Identifiers: *Brazilian coastal dunes, *Dunes (Deformation), Roots.

Coastal dunes of Brazil differ considerably from desert dunes in their internal structure primarily because of differences in the degree of cohesion within the sand. The coastal dunes formed under conditions of high humidity and heavy rainfall, and the avalanching of sand on the lee sides of these dunes has produced many distinctive deformational structures characteristic of wet, cohesive sand. The roots of plants growing on the dunes have further contorted and ruptured cross-lamination in the dunes, forming additional distinctive structures.—Copyright 1973, Biological Abstracts, Inc.

WATER TRANSMISSION PROPERTIES OF AN ASPHALT BARRIER,
Minnesota Univ., St Paul. Dept. of Soil Science
J. P. Palta, G. R. Blake, and D. A. Farrell
Soil Sci Soc Am Proc Vol 36, No 5, p 709-714 1972. Illus.
Identifiers: *Asphalt barrier, Capillary potential, Discontinuities, Flow, Soils, *Water transmission, *Steady flowSoil columns)

The water transmission properties of an asphalt barrier were studied using samples taken from a barrier formed in Zimmerman fine sand. Steady flow experiments using a 9.0-cm diameter soil column showed that water movement through the barrier was affected by the capillary potentials on both sides of the barrier if these potentials exceeded a critical value or 'break point' which ranged from minus 32 to minus 20 cm depending on the flow rate. This steady value increased from minus 4.3 to minus 1.5 cm when the flow rate was increased from 0.009-0.058 cm/hr. The hysteretic flow properties of the barrier are explained using a model based on the following assumptions: flow occurs mainly through cracks of varying width, and the ratio of the draining to wetting potentials of the cracks exceeds unity and is independent of crack size.—Copyright 1973, Biological Abstracts, Inc.

INFLUENCE OF SOIL BULK DENSITY AND MATRIC PRESSURE ON SOIL RESISTANCE TO PENETRATION,
H. F. Mirreh, and J. W. Ketcheson.
Can J Soil Sci Vol 52, No 3, p 477-483 1972. Illus.
Identifiers: Bulk density, *Mathematical models, Matric pressure, *Soils (Clay loam), Soil penetration resistance, Regression analysis.

Cylinders of a clay loam soil were adjusted to different bulk density and matric pressure combinations to study soil resistance to a penetrating probe. Regression analysis of the penetrometer data was conducted. A 3-dimensional plot of the generated soil resistance values was constructed to illustrate the nature of the interaction. At any 1 bulk density in the range 1.0-1.5 g/cc, soil resistance values tended to pass through a maximum as soil moisture was removed over the matric pressure range 1.0-8.0 atm. The tendency was most pronounced at the lower bulk densities. Implications on root growth and soil management are briefly discussed.—Copyright 1973, Biological Abstracts, Inc.

PHYSICAL PROBLEMS AND THEIR AMELIORATION IN SALTY SOILS,
Department of Overseas Trade, Canberra (Australia). Trade Commissioner Service.
L. A. Downey.

The Journal of the Australian Institute of Agricultural Science, Vol 37, No 4, p 314-326, December 1971. 5 fig, 88 ref.

Descriptors: *Alkaline soils, Australia, *Soil physical properties, *Hydrologic properties, *Hydraulic conductivity, Fracture permeability, Evaporation, Excess water (Soils), Gypsum, Benefits, Crop response, Land reclamation.
Identifiers: *Australia (Riverine Plain).

Sodic soils of the Riverine plain, Australia, present a problem because of their poor physical characteristics which tend to be unstable under the action of water, and disperse to form an infiltration barrier at the surface. Their hydraulic conductivity is low; and they are prone to high intensity cracking, along with an evaporation rate which may equal that from surface soil, causing the drying rate to accelerate. Strata with sodic properties may form in the subsoil and cause water logging problems in the surface layers. Application of gypsum has been shown to give short-term improvements: increased hydraulic conductivity, improved water intake and increased porosity. These improvements are manifested in improved germination and higher yields--at least with some crops. Tillage combined with gypsum applications may give short-term increases in water penetration. Long-term reclamation of sodic soils may never be achieved at a realistic cost level. Combining deep tillage+gypsum+nitrogen+pasture+accurate surface levels is suggested as the best solution at present. (Bahre-Arizona)

Identifiers: *India (Punjab), Pedogenesis, Thar desert.

The evolution of the pedogenic calcite formation is investigated by studying the climate of the plain grades from arid and hot to semi-arid and hot to less hot, and the soils, respectively, from Camborthids, through Calciorthids and Ustochrepts, to Haplustalfs. Nine different forms of calcite accumulations from microcrystalline calcite to coarsely recrystallized crystallaria are distinguished and described. They may form combinations which are characteristic for specific soil conditions. An evolution pattern of different forms could be determined, not only within profiles, but also among different soil types of the sequence; the highest complexity being found in calcic horizons. Specific forms were observed in the saline and water-logged soils. The origin of the different calcareous accumulations is discussed and authigenic character of the calcitic nodules is propounded. In the scope of these findings, the use of the suffix Ca (Calcite) in horizon designation is considered. (Bahre-Arizona)

ONE-DIMENSIONAL CONSOLIDATION OF A CLAY LAYER WITH IMPEDED DRAINAGE BOUNDARIES,
Illinois Univ., Urbana. Dept. of Civil Engineering.
G. Mesri.
Water Resources Research, Vol 9, No 4, p 1090-1093, August 1973. 3 fig, 6 ref.

Descriptors: *Consolidation, *Clays, *Soil mechanics, *Drainage effects, Soil physical properties.

The main source of settlement of drained clays is often a single compressible layer bounded above and below by layers that contribute little to total settlement but that have coefficients of permeabilities and thicknesses such that they can be considered neither freely draining nor impervious. Furthermore, the top and bottom drainage layers can have unequal permeabilities and thicknesses. An analytical solution to the one-dimensional consolidation of a clay layer with unlike drainage boundaries is developed, and the results are presented in the form of consolidation versus time to facilitate their use by engineers. NOTE ON THE INFILTRATION ADVANCE FRONT FROM BORDER IRRIGATION,
Connecticut Agricultural Experiment Station, New Haven.
J-Y. Parlange.
Water Resources Research, Vol 9, No 4, p 1075-1078, August 1973. 1 fig, 7 ref.

Descriptors: *Infiltration, *Border irrigation, Wetting, Soilwater movement, Numerical analysis, Water spreading.

The spreading of a water layer of constant thickness over a near horizontal soil surface is analyzed. The solution was applied consistently for short times. It estimates gravity effects properly by taking into account the pressure head of the water layer. An infiltration law valid for all times is also suggested to obtain numerical solutions in practical cases. (Knapp-USGS)

A NUMERICAL AND SIMILARITY ANALYSIS OF INFILTRATION INTO CRUSTED SOILS,
Purdue Univ., Lafayette, Ind.
L. R. Ahuja.
Water Resources Research, Vol 9, No 4, p 987-994, August 1973. 5 fig, 14 ref.

Descriptors: *Infiltration, *Soil water movement, *Surface sealing, *Impact (Rainfall), Numerical analysis, Soil surfaces, Earth-water interfaces, Soil compaction, Wetting, Unsaturated flow.
Identifiers: *Crusted soils, *Crusts.

One-dimensional, vertical infiltration of water through a crust of constant nonzero hydraulic resistance is theoretically examined by using a numerical solution and a similarity reduction of the problem. The soil-water content at the crust-soil interface increases with time to approach a predictable final steady water content asymptotically. A greater proportion of the flow takes place at intermediate to low water contents, and without an appreciable effect of gravity, as the crust resistance increases. For the water content at the crust-soil interface, the cumulative infiltration, and the wet front progress, simple expressions arise from the similarity reduction analysis, which is based on specific functional forms of the soil-water diffusivity and suction head, and a relatively small initial soil-water content. For early to intermediate times of flow, the similarity analysis describes adequately the calculated numerical solution flow data for Yolo soil. For intermediate to large times, a Green and Ampt type solution is linked to the similarity expression for cumulative infiltration with fair success. (Knapp-USGS)

SIMULTANEOUS TRANSPORT OF SOLUTES AND WATER UNDER TRANSIENT UNSATURATED FLOW CONDITIONS,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Dept. of Soil Physics.
E. Bresler.
Water Resources Research, Vol 9, No 4, p 975-986, August 1973. 5 fig, 22 ref.

Descriptors: *Unsaturated flow, *Unsteady flow, *Mass transfer, *Leaching, *Solutes, Groundwater movement, Convection, Dispersion, Mixing, Aqueous solutions, Path of pollutants, Numerical analysis, Finite element analysis.

Theoretical and mathematical tools are presented for analyzing transient one-dimensional vertical simultaneous transfer of noninteracting solute and water in unsaturated soils. The transient diffusion convection equation is solved numerically by an approach that eliminates the effect of numerical dispersion. The numerical results are compared with some analytical solutions for steady water flow. For transient infiltration the results are compared with field data. These comparisons indicate that the theory as well as the numerical method is reliable and can be used with confidence. Results are given for typical cases of infiltration, redistribution, and evaporation of water from the soil and their effect on dispersion coefficients and salt concentration profiles. (Knapp-USGS)

FIXING CATION INTERACTION WITH BLISTER-LIKE OSMOTIC SWELLING ON VERMICULITE CLEAVAGES,
Wisconsin Univ., Madison. Dept. of Soil Science.
K. Sridhar, and M. L. Jackson.
Available from NTIS, Springfield, Va., as Coo-1515-42; $4.00 in paper copy, $1.45 in microfiche.
Report COO-1515-42, 1972. 30 p, 6 fig, 2 tab, 15 ref.

Descriptors: *Cation exchange, *Silicates, *Clay minerals, *Expansive clays, Strontium radioisotopes, Osmosis, *Soil treatment, Soil contamination, Soil chemical properties, Absorption, Hydrate processes, Fallout.

Blister-like surface configurations on micaceous vermiculite, produced by osmotic swelling of the interlayers, were studied by replica electron microscopy and by electron microprobe analysis. It is hypothesized that trapping of hydrated cations (Ce, Mg, or fallout Sr90) in blisters occurs since the electrical double layer is thick there. Shrinkage of artificial blisters was greater by treatment with KC1 solutions as compared with solutions of more hydrated cations since the interlayer hydrated cations were more effectively removed. Treatment by 2-hr contact with 1N and 0.01N KC1 solutions completely collapsed artificially produce blisters but not natural blisters. (Bopp-ORNL)

VERTICAL MULCH EFFECTS ON SOIL WATER STORAGE,
Agricultural Research Service, Fort Collins, Colo. Soil and Water Conservation Research Div.
M. L. Fairbourn, and H. R. Gardner.
Soil Sci Soc Am Proc. Vol 36, No 5, p 823-827. 1972. Illus.
Identifiers: Diffusivity, Evaporation, *Mulch, *Soil-water storage, Watersheds, Infiltration, *Soil treatments.

Soil water storage for vertical mulch and furrow treatments on level soil surfaces and vertical mulch and nonmulch treatments with microwatersheds was evaluated in a constant temperature laboratory. The vertical mulch treatment on a level surface saved 30-40% more of the applied water than the furrow treatment. The efficiency of storage with vertical mulch was reduced by 17% when the surrounding soil surface was wet during water application. A microwatershed with vertical mulch stored 7-10% more of the applied water than a microwatershed without mulch. Depth of water infiltration and dry soil surface adjacent to the mulch appeared to be the factors that reduced evaporation losses from vertical mulch treatments. A comparison of scaled evaporation data with the diffusivity curve for the soil used demonstrated that the diffusivity equation was useful for predicting soil water loss by evaporation for microwatershed treatments of this experiment.--Copyright 1973, Biological Abstracts, Inc

COMPARISON BETWEEN COMPRESSIBILITIES OF SANDS AND CLAYS,
University of Southern California, Los Angeles. Dept. of Petroleum Engineering.
G. V. Chilingarian, C. T. Sawabini, and H. H. Rieke III.
Journal of Sedimentary Petrology, Vol 43, No 2 p 529-536, June 1973. 2 fig, 29 ref.

Descriptors: *Compressibility, *Sands, *Clays, Mechanical properties, Compaction, Hydrostatic pressure, Laboratory tests, Sedimentology.
Identifiers: *Compressibility (Uniaxial), *Compressibility (Triaxial).

The pore and bulk volume compressibilities of unconsolidated sands and clays were determined in triaxial and uniaxial compaction. The bulk compressibilities of unconsolidated sands ranged from 0.00074 to 0.00007 per psi at effective pressure range of 0 to 3,000 psi, whereas the pore volume compressibilities ranged from 0.001 to 0.0001 in the same pressure range using triaxial compaction. These values are greater by about 50% to 100% than those obtained on using uniaxial compaction equipment. The bulk compressibilities obtained on compacting montmorillonite clay saturated in sea water using the triaxial apparatus were found to be about 300% to 500% higher than those obtained on using uniaxial loading in the applied pressure range of 400 to 20,000 psig. A graph is presented comparing the compressibilities of various clays, sands, sandstones, shale, and limestone. Compressibilities of unconsolidated sands appear to be very close to those of clays. Compressibilities of the consolidated sandstones, shales, and carbonates range from 0.00001 to 10 to the minus 7th power per psi in the 500 to 15,000 psi pressure range. (Knapp-USGS)

THE SOILS OF THE VILLECARTIER FOREST,
Institut National des Sciences Appliquees, Rennes (France). Laboratoire de Mineralogie Geotechnique.
J. Esteoule, J. Guyader, and J. Touffet.
Bull Assoc Fr Etud Sol. No 2 p 29-46, 1971. Illus.
Identifiers: Acidic brown soils, Forest, *France (Villecartier Forest), Gley, Humus, Pedogenesis, *Soils, *Vermiculite.

The evolution of these soils is leading to the establishment of acidic brown soils characterized by an acid humus of the moder type, by very low pH's, a considerable desaturation of the complex, and the appearance of vermiculite as the primary

clay mineral. The pronounced acidity of the profile exerts a considerable flocculating effect on the clay-humus complex. The acid evolution and absence of leaching go together with the rather low precipitation that is regularly distributed throughout the year. The relatively flat topography and the muddy texture of the superficial formations create conditions favorable to hydromorphism. The considerable interference of this local factor on climactic evolution results in a complete range of profiles going from brown acidic soil to hydromorphous soils with pseudogley and gley. Polyphasic soils were also present. In some cases it was difficult to distinguish the characteristics resulting from present pedogenesis from those resulting from previous evolution.--Copyright 1973, Biological Abstracts, Inc.

COMPLEXES AFFECTING THE SOLUBILITY OF CALCIUM CARBONATE IN WATER,
Illinois State Water Survey, Champaign.
T. E. Larson, F. W. Sollo, Jr., and F. F. McGurk.
Available from the National Technical Information Service as PB-222 496, $3.50 in paper copy, $1.45 in microfiche. Illinois Research Report No 68, July 1973. 49 p, 8 tab, 18 ref. OWRR A-051-ILL (1) and S-029-ILL (1). 14-31-0001-3513.

Descriptors: *Hardness (Water), *Calcium carbonate, *Magnesium, Scaling, Corrosion, Solubility, Ions, *Carbonates, *Bicarbonates.
Identifiers: *Dissociation constants.

The objectives were to evaluate the dissociation constants of the calcium and magnesium complexes with the hydroxide, carbonate, and bicarbonate anions at temperatures of 5, 15, and 25C. This work was conducted at ionic strengths in the range from .002 to .02, corresponding roughly to waters with total dissolved solids contents of 100 to 1,000 mg/l. The dissociation constants have been determined in terms of activities, so that they are valid at least over the range of ionic strengths at which the tests were made. A titration method was used to measure the effects of complex formation on the pH of reaction mixtures and appropriate computer programs were developed to calculate the dissociation constants. Dissociation constants have been developed for the complexes of calcium and magnesium with the hydroxide and carbonate anions at 5, 15, and 25C. The bicarbonate complex of magnesium was studied at 25C, but no reliable and valid dissociation constant for this complex was obtained from the study. It appears probable that the constant for the calcium bicarbonate complex may be equally difficult to evaluate. The development of reliable dissociation constants of the complexes studied in this project, and a method to utilize them in calculating pH would be an aid in producing water of high quality and preventing deterioration of water distribution systems.

DROGUE MEASUREMENTS OF THE CIRCULATION IN GRAND TRAVERSE BAY, LAKE MICHIGAN,
Michigan Univ., Ann Arbor. Dept. of Atmospheric and Oceanic Science.
E. C. Monahan, G. T. Kaye, and E. D. Michelena.
Available from NTIS, Springfield, Va 22151 as COM-73-10541 Price $3.00 printed copy; $1.45 microfiche. Michigan University Sea Grant Program Technical Report 35 (MICHU-SG-73-202), February 1973. 35 p, 21 fig, 11 ref.

Descriptors: *Currents (Water), Data collections, *Lake Michigan, Measurement, Methodology, Buoys, Winds, Wind velocity, *Water circulation, *Michigan.
Identifiers: *Grand Traverse Bay (Lake Michigan), *Drogue techniques.

In 1970, an intensive multidisciplinary field study was initiated of Grand Traverse Bay of Lake Michigan. The portion of this study directed at obtaining a description of the currents, periodic and aperiodic, that exist in Grand Traverse Bay has involved two distinct types of current measurement: Lagrangian and Eulerian. The application of essentially conventional drogue techniques to the quasi-Lagrangian measurement of the circulation in Grand Traverse Bay and the results obtained are described. The first measurements were made in the west arm of Grand Traverse Bay on July 23, 1970, using four flag/buoy/Vee drogue units. The float proper is a 1.5-ft diameter, polyurethane disc, 9 inches thick. The polyurethane disc is armored with a fiberglass covering. A 10-ft long, thin-walled, electrical conduit passes through the center of the float and serves both as a mast for the flag and a rigid point of attachment for the drogue line. Each Vee drogue is composed of two 6- by 4-ft canvas panels laced to rectangular frames of thin-walled conduit. The two panels are hinged together along a pair of 6-ft sides. The effective depth of the current being measured is determined by the length of line used to suspend the Vee drogue beneath the flag-buoy. The drogue trajectories are plotted on charts. Each chart is accompanied by a wind history showing graphically the wind speed and direction. (Woodard-USGS)

THE FALL OVERTURN AND WINTER COOLING IN LAKE SUPERIOR,
Texas Univ., Port Aransas. Inst. of Marine Science.
N. P. Smith.
Limnology and Oceanography, Vol 18, No 3, p 483-487, May 1973. 3 fig, 8 ref.

Descriptors: *Lake Superior, *Turnovers, *Mixing, Water temperature, Seasonal, Thermal stratification, Water circulation.

Daily average temperatures and standard deviations were computed from two nearshore time series from Lake Superior during the fall overturn and the following period of cooling in winter 1966-67. Temperatures from the 10-m level decrease irregularly to near 0 deg C by mid-February. Average temperatures from the 200-m level decrease to 1.9 deg C by late January. The water column becomes isothermal at 4 deg C in early December. Energy density spectra computed from both time series show energy values dropping off exponentially with decreasing period and no significant spectral peaks. (Knapp-USGS)

THE EFFECTS OF SEVERAL WEATHER DISTURBANCES ON THE SEICHES IN LAKE TRAVIS, TEXAS,
Texas Univ., Austin. Applied Research Labs.
G. E. Ellis, J. A. Shooter, and C. W. Horton, Sr.
Limnology and Oceanography, Vol 18, No 3, p 476-482, May 1973. 9 fig, 12 ref.

Descriptors: *Seiches, *Lakes, *Texas, Waves (Water), Winds, Storms.
Identifiers: *Lake Travis (Tex).

Experimental observations of the seiches in a branch of Lake Travis were made before and after passage of several weather disturbances. Power spectra present the changes in energy density occurring with the passage of a squall line, a fast moving cold front, and steady winds. Squall lines and fast moving cold fronts act as short impulses of energy for the seiche activity in Lake Travis. A duration of 60 sec was found for the impulse associated with the squall line. The duration for the fast moving cold front was less than 30 sec. The spectral lines of the seiche activity are highly developed, as one would expect, after steady northwest winds and also on a very calm summer day. (Knapp-USGS)

Ecology of Phytoplankton with respect to their distribution at different depths of water and associated hydrobiological factors (viz, temperature of water and atmosphere, pH and water level) and macrovegetation were studied in 2 adjoining (Indian) lakes during 1968-69. Observations were recorded at 3 depths; surface, 1 m, and bottom. The phytoplankton show 3 peaks; Mar.-April, July-Aug. and Oct.-Nov. Of these, the organisms showed 3 patterns; the diatom-dinoflagellate peak, the copepod peak, and the peak of varied phytoplankton and high zooplankton. Dominance of algae was in the order; Diatoms Chlorophyceae and Myxophyceae. A census of algae revealed about 100 genera and their frequency was determined. Distribution of algae in relation to dominant macroflora is given.--Copyright 1973, Biological Abstracts, Inc.

UTILIZATION OF THE CRAYFISH ORCONECTES LIMOSUS AS FORAGE BY WHITE PERCH (MORONE AMERICANA) IN A MAINE LAKE,
Maine Cooperative Fishery Unit, Orono.
W. F. Reid, Jr.
Trans Am Fish Soc. Vol 101, No 4, p 608-612. 1972. Illus.
Identifiers: *Crayfish, Forage, Insects, Lakes, *Maine, Morone-Americana, Orconectes-Limosus, Osmerus-Mordax, *White perch.

White perch (Morone americana) under 201 mm long from a lake containing the crayfish Orconectes limosus ate mostly insects. Perch from 201 to 280 mm long fed upon insects, fish, and crayfish. White perch over 280 mm fed mainly upon crayfish. Young-of-the-year O. limosus were rarely utilized as forage by white perch. White perch under 201 mm long from a lake not having crayfish fed mostly upon insects but also ate fish. Perch over 200 mm long were almost exclusively piscivorous, the main forage fish being the rainbow smelt (Osmerus mordax).--Copyright 1973, Biological Abstracts, Inc.

ECOLOGIC OBSERVATIONS ON THE HYDROPHILIC VEGETATION OF A SMALL LAKE OF MOUNT FUMAIOLO (APENNINES OF ROMAGNA), (IN ITALIAN),
Florence Univ. (Italy).
M. Raffaelli.
Identifiers: Clyzophytes, Ecologic studies, Haptophytes, *Hydrophilic vegetation, *Italy, Lakes, Rhizophytes, Spongophytes, Vegetation, Water plants.

The ecological conditions of the vegetation of a little lake, situated on the Tyrrhenian side of Monte Fumaiolo (Appennino Ramagnolo, Italy) were examined. According to the conditions of the environment (soil covered with shallow water, marshy or only damp, possible presence of a water current, seasonal variation of the water level) 3 different areas of vegetation, which correspond to as many aspects, have been distinguished: central area, intermediate zone and marginal zone. The latter has subsequently been divided into an outer peripheric belt and some more internal areas (water conveyors). The vegetation of each single zone was then examined, pointing out the life forms and their adaptiveness to the different hygric conditions. Clyzophytes prevail in the central and intermediate areas, with a considerable amount of haptophytes and rhizophytes, while spongophytes are scarce. On the marginal zone (outer belt and water conveyors) spongophytes are predominant, clyzophytes are scarce and water plants are completely absent.--Copyright 1973, Biological Abstracts, Inc.

WIND-SWEPT WATER SURFACE IN LABORATORY COOLED BY APPLYING HEAT,
Naval Research Lab., Washington, D.C.
A. H. Schooley.
Journal of Marine Research, Vol 31, No 1, p 93-95, 1973. 1 fig, 1 ref.

Descriptors: *Laboratory tests, *Winds, *Radiation, *Water temperature, Data collections, Water, Heat, Air-water interfaces, Measurements, Evaluation, Heat balance, Temperature, Lakes, *Model studies.

In a 40 cm x 45 cm x 20 cm basin containing 16 cm of water an experiment was conducted which implies that there may be conditions on the sea where the surface may be warmer under a cloud shadow than in direct sunlight. Wind was directed across the surface of the water while heat from a 215 watt lamp was directed down on it. Measurements of water temperature, air temperature, net radiation,

and humidity were taken while the lamp was alternately switched on and off. When the lamp was on and all else was held constant the mean temperature of the near-surface water reached 21.1 C. When the lamp was off and all else was held constant the mean near-surface water temperature reached 21.9C. (Jerome - Vanderbilt)

Biol Conserv. Vol 4, No 4, p 256-262, 1972. Illus.
Identifiers: *Africa (Great Lakes), Conservation, Evolution, Fishery management, Fish, Invertebrates, Lakes, Management, Water pollution.

The Great Lakes of East Africa are not only the repositories of the world's 3 richest lacustrine fish faunas but also harbor unique assemblages of invertebrates. A few of these animals are illustrated. These lakes are of immense scientific interest, not merely by virtue of their richness in species, nor even because so many species are endemic, but as field laboratories of evolution whose operations we have scarcely begun to understand. They are also natural resources of great value, being enormous reservoirs of pure water, and the sites of fisheries producing many thousands of tons of fish per annum. Evidence is presented which unequivocally indicates that, by virtue of their tropical location and hydrological regimes, these lakes are much more susceptible to the damaging influences of O2-demanding pollution than their temperate-zone counterparts, and that, should they become contaminated, their renewal times are so great that a virtually irreversible catastrophe is possible. Evidence of the mismanagement of the fisheries of Lake Victoria is also presented and the danger of further uninformed exploitation pointed out. Certain apparent remedies are shown to be highly dangerous. The technology of fishing has advanced more rapidly than scientific understanding of the extremely complex ecosystems involved.--Copyright 1973, Biological Abstracts, Inc.

TIDAL MARSH CILIATES (PROTOZOA): MORPHOLOGY, ECOLOGY, SYSTEMATICS,
New Hampshire Univ., Durham. Dept. of Zoology.
A. Borror.
Acta Protozool. Vol 10, No 1-5, p 29-72. 1972. Illus.
Identifiers: Chlamydodon-Lynchelliformis, *Ciliates, Ecology, Marshes, Morphology, New, New Hampshire, Paranophrys-Magna, Protozoa, Species, Systematics, *Tidal marshes, Trichotaxis-Pulchra, Trimyema-Pleurispirale, *New Hampshire.

Over 100 spp. of ciliates occur in New Hampshire saltmarshes. Anatomy, behavior, autecology, and systematic position of 29 spp. are discussed, including previously described species of the genera Coleps, Colpoda, Condylostoma, Dysteria, Frontonia, Geleia, Histriculus, Litonotus, Mesodinium, Nassula, Oxytricha, Paralembus, Parameciun, Placus, Plagiopyla, Pleuronema, Prorodon, Sonderia, Strombidium, Trachelonema, Trochilioides and Uropedalium. Four new species are described in the genera Chlamydodon, Paranophrys, Trachotaxis, and Trimyema (C. lynchelliformis, P. magna, Trimyema pleurispirale, Trichotaxis pulchra). Two species are transferred from Pseidocohnilembus to Paralembus. This serves as a reference for determination of interrelationships of these ciliates and associated environmental factors.--Copyright 1973, Biological Abstracts, Inc.

CHARACTERISTICS OF DIATOMS OF PRESENT-DAY GLACIAL LAKES OF THE POLAR URALS,
V. N. Stenin.
Biol Nauk. Vol 15, No 5, p 66-73, 1972.
Identifiers: *Diatoms, Glacial lakes, Photosynthesis, Suppression, *Urals (USSR).

An analysis of 10 lakes of the polar Urals (USSR) showed that glacial lakes are poor in the composition of diatoms. Mountain-valley lakes far from glaciers are distinguished by considerable development of diatoms. Some sediments of such lakes may be characterized as diatomites. The diatoms of glacial lakes are represented only by Arctic species; many species of the temperate zone are present, in addition to northern alpine diatoms, in the mountain-valley lakes. Freshwater-brackish water species are absent in glacial lakes, except for single ubiquists; in mountain-valley lakes, these diatoms are found rarely or singly. Truly planktonic diatoms are almost completely absent in glacial lakes as a consequence of suppression of photosynthetic activity in the turbid water.--Copyright 1973, Biological Abstracts, Inc.

STUDY OF THE BIOLOGY OF PELOPIA PUNCTIPENNIS MG. (CHIRONOMIDAE, DIPTERA) IN THE MINGECHAUR RESERVOIR (IN RUSSIAN),
A. R. Khalilov.

Izv Akad Nauk Az SSR Ser Biol Nauk. 5/6, p 95-96, 1971.
Identifiers: Biology, *Chironomidae, *Diptera, *Mingechaur Reservoir (USSR), Pelopia-punctipennis, Reproduction, Reservoirs, Temperature, USSR.

In the Mingechaur reservoir (USSR), P. punctipennis produces 2 generations (April and Aug.). The females lay eggs within 50-65 hr at an air temperature of 12-16C. The number of eggs in each clutch varied from 400 to 680. The diameter of the clutches was 5.6-6.5 mm, the length of the eggs 0.35-4.0 mm, and the width 0.10-0.20 mm. The density of the larvae reached 680 larvae/m2 at a biomass of 0.40 g/m2.--Copyright 1973, Biological Abstracts, Inc.
W73-13621

HYDROBIOLOGICAL INVESTIGATION OF LAKE LERE AND NEIGHBORING PONDS: II. ROTIFERA,
Office de la Recherche Scientifique et Technique Outre-Mer, Paris (France).
R. Pourriot.
Cah O R S T O M Ser Hydrobiol, Vol 5, No 2, p 171-174, 1971.
Identifiers: Distribution patterns, Hydrobiological studies, *Lake Lere (Chad), Ponds, *Rotifera.

Hydrobiological investigation of Lake Lere (Chad) and neighboring ponds revealed 14 species or subspecies of Brachionidae, 4 Lecanidae, 2 Notommatidae, 6 Trichocercidae, 3 Synchaetidae, 1 Asplanchnidae (Pseudotrocha); 5 Testudinellidae, 1 Conochilidae (Monimotrocha); and 1 Collothecidae (Collothecacea). Following special remarks on the form and size of Brachionus angularis, B. caudatus, Notommata sp., Trichocerca mucosa, and T. ruttneri, the distribution of rotifers found was discussed. A comparison of the species of Lake Lere and Lake Chad showed a similarity between the rotifer populations of these 2 lakes. Most of the forms of Lake Lere were cosmopolitan, and only 5 of them (less than 14%) were preferentially tropical or subtropical: Anuraeopsis coelata, Brachionus caudatus, Keratella tropica, Trichocerca ruttneri, and T. tchadiensis. All were species known for the African plankton populations taking into account certain confusions or possible synonomies such as Trichocerca similis and T. birostris.--Copyright 1973, Biological Abstracts, Inc.

THE EFFECT OF WATER AND SALT FLUXES ON THE TRANSROOT POTENTIAL IN HELIANTHUS ANNUUS,
Atomic Energy Agricultural Research Center, Tando Jam (Pakistan).
A. Q. Ansari, and D. J. F. Bowling.
J Exp Bot. Vol 23, No 76, p 641-650. 1972. Illus.
Identifiers: *Water Flux, Helianthus annuus, Ion transport, Roots, *Salt flux, *Sunflower roots.

The effect of an artifically imposed water flux on the trans-root electrical potential difference was studied in excised sunflower roots. The potential of the xylem sap became more negative with respect to the external medium as the rate of water flow was increased. This change appeared to be related to an accompanying increase in the flux of ions. The effect of increasing the water flux on the vacuolar potential difference of the epidermal cells was also investigated. It also became more negative with increasing water flux. Both potentials were measured simultaneously in the same root. On increasing the water flux it was found that the trans-root potential began to rise immediately but there was a time lag of approximately 2 min before the vacuolar potential began to change. The relevance of these potential changes to the mechanism and pathway of ion transport across the root is discussed.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF TEMPERATURES AND WATER TABLE DEPTH ON THE GROWTH OF CREEPING BENTGRASS ROOTS,
Purdue Univ., Lafayette, Ind. Dept. of Agronomy.
D. S. Ralston, and W. H. Daniel.
Agron J. Vol 64, No 6, p 709-713. 1972. Illus.
Identifiers: Agrostis-palustris, *Bentgrass roots, Dew, *Grass growth, Infiltration patterns, Porosity, Roots, Sand, Size, *Temperatures, *Water table depth.

The PURR-WICK system provides an impermeable underlay, plus possible retention of free water by outflow drainage control. The effect in this system of sand texture, depth of water reserve and temperature was studied. 'Penncross' bentgrass (Agrostis palustris Huds.) was grown in columns of finer and coarser sand mixes with water tables maintained at depths of 11, 25 and 40 cm in constant temperature chambers of 15 and 30C for 9 wk. Temperature had the greatest effect. At 15C root growth was slow initially but steadily maintained. At 30C initial root growth was rapid but declined to little or no growth, so that total root length at 15C was 3 times that for 30C. Within each temperature the water table X sand interaction was significant. Root growth was better in the finer sand for the 40-cm treatment. Deepest root growth was found at 15C in the finer sand mix with the water table at 40 cm. Where O2 diffusion was favored by coarse texture, roots were still limited by higher temperature.--Copyright 1973, Biological Abstracts, Inc.

SOME ECOLOGICAL RELATIONSHIPS OF THE INVERTEBRATE DRIFT IN PRATERS CREEK, PICKENS COUNTY, SOUTH CAROLINA,
Oklahoma Univ., Norman. Dept. of Zoology.
W. K. Reisen, and R. Prins.
Ecology. Vol 53, No 5, p 876-884. 1972, Illus.
Identifiers: Biomass, Creek, Density, Dependence, Drift, Ecological studies, Ephemerella Sp, *Invertebrate drift, Praters, Relationships, *South Carolina (Praters Creek).

The role of organic drift in the ecology of a southern, upper Piedmont stream was evaluated from Sept 1967 to Aug. 1968. By sampling for a 24-hr period each mo., data on the diel and monthly fluctuations of the drift were obtained. Chemical and physical analyses of the water were made to evaluate the role of selected abiotic variables in the ecology of the drifters. Community biomass could not be estimated by drift because fluctuations in the standing crop were not significantly correlated with fluctuations in the drift rate. With the exception of Ephemerella sp. the drifters did not respond in a density-dependent fashion to benthic population increases. Drift seemed to be initiated by pupation or emergence activity. The diel drift for the majority of the benthos examined was decidely negatively photoactic. Pronounced crepuscular activity was observed for most of the hemimetabolous forms with a consistent midnight depression of activity.--Copyright 1973, Biological Abstracts, Inc.

ROOT DISTRIBUTION AND SOIL MOISTURE STUDIES IN SOME PERENNIAL RYEGRASS AND PHALARIS PASTURES ON SOUTHERN TABLELANDS, SOUTH-EASTERN AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
E. W. Pook, and A. B. Costin.
Aust C S I R O Field Stn Rec. Vol 10, No 2, p 59-72. 1971. Illus.
Identifiers: *Australia, Clover, Grass, Lolium-Perenne, Pastures, Perennial, *Phalaris, *Root systems, *Rye grass, Soils, *Soil moisture, Subterranean, Tablelands.

Quantitative assessments were made of the distribution of perennial ryegrass (Lolium perenne L.) and phalaris (Phalaris tuberosa L.) root systems developed in typical perennial pastures intensively grazed by sheep on the Southern Tablelands of New South Wales and the Australian Capital Territory. At Wollogorang, near Goulburn, dominant perennial ryegrass was found to have superficial development of roots, with virtually full exploration of topsoil, but limited vertical extension of roots into subsoil. In sown pastures on the southern tablelands shallow-rooted species such as perennial ryegrass were seriously affected by the dry soil conditions experienced between 1965 and 1968. In phalaris-subterranean clover pastures at Ginninderra, near Canberra, phalaris roots did not fully exploit the topsoil, but in contrast to perennial ryegrass were found to have strong vertical extension of deep roots in subsoil. The survival value of the deep root system of phalaris during prolonged droughts was borne out by soil moisture measurements. There was pronounced drying out of the soil profile within and beyond the apparent level of root extension; nevertheless, some available water remained in the deeper subsoils to which the phalaris roots had access.--Copyright 1973, Biological Abstracts, Inc.
W73-13110

PRODUCTIVITY AND DISTRIBUTION OF TRICHOPTERA LARVAE IN A COLORADO MOUNTAIN STREAM,
Southern Methodist Univ., Dallas, Tex. Dept. of Biology.
J. O. Mecom.
Hydrobiologia. Vol 40, No 2, p 151-176. 1972. Illus.
Identifiers: *Colorado (St. Vrain River), *Distribution patterns, Larvae, Mountain streams, *Productivity, Stream, Temperature, *Trichoptera larvae.

From June 1968 to late May 1969, collection of more than 20,600 immature Trichoptera were made from the St. Vrain River of Colorado. Agapetus sp., Arctopsyche grandis, Brachycentrus americanus, Ecclisomyia maculosa, Hydropsyche sp., H. occidentalis, Helicopsyche borealis, Leptocella sp., Neothremma alica, Rhyacophila acropedes and Sortosa sp. were taken at 8 sites ranging from 1565 to 3200 m in altitude. The Trichoptera of the St. Vrain exhibited a distinct altitudinal zonation with Zone I (1565 m) dominated by Leptocella, Hydropsyche sp., and Helicopsyche borealis; Zone II (1750 to 2350 m) was dominated by Brachycentrus americanus and Hydropsyche occidentalis; Zone III (2350 m) was considered a transitional area. In Zone IV (2650 m) and Zone V (2950 to 3250 m) Neothremma alicia and Arctopsyche grandis were the most successful genera, respectively. Temperature is proposed as the major variable controlling altitudinal zonation. Standing crop productivity of Trichoptera was determined from timed collections and expressed as population density (number of organisms collected per 30 min) and organic biomass (dry organic matter represented by organisms collected per 30 min). Intermediate altitudes (2300 m) exhibited the lowest productivity but greatest species diversity. Highest productivity occurred below 1600 m but organic biomass was surprisingly high above 2900 m. Changes in productivity in relation to altitude are discussed in relation to temperature, food availability, severe flooding, and other variables. Productivity on a yearly basis was greatest in spring and at minimum levels during autumn and early winter. The holometabolous life cycle of Trichoptera, temperature, and current seem to be the major governing factors of seasonal productivity.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF PLANT MOISTURE STRESS ON CARBOHYDRATE AND NITROGEN CONTENT OF BIG SAGEBRUSH,
Utah Univ., Salt Lake City. Dept. of Biology.
S. J. Dina, and L. G. Klikoff.
Journal of Range Management, Vol 26, No 3, p 207-209, May 1973. 2 fig, 1 tab, 25 ref.

Descriptors: *Moisture stress, *Carbohydrates, *Nitrogen, *Sagebrush, *Utah, Consumptive use, Grazing, Range management, On-site investigations, Livestock.
Identifiers: *Red Butte Canyon (Utah).

Plants were selected from Red Butte Canyon, east of Salt Lake City, Utah, to delineate the effects of plant moisture stress on carbohydrate and nitrogen content of important range species. Proper management of grazing intensity on summer ranges, when high plant water stress conditions exist, is needed. Water potential of big sagebrush shows great seasonal variation, ranging from a low of -70.3 bars in September to a high of -8.3 bars in April. Starch content remained fairly consistent in water stressed plants, although sugar content significantly increased in leaves, stem and roots. Leaf nitrogen content significantly decreased in water stressed plants, while stem nitrogen content significantly increased. Overgrazing during summer range conditions, when plant water stress is likely high, could be detrimental since much of the stored nitrogen and carbohydrate would be removed and range quality could therefore be adversely affected. (Bahre-Arizona)

THE PLANT ECOLOGY OF UTAH'S DESERT RANGELANDS,
Utah State Univ., Logan. Dept. of Range Science.
M. M. Caldwell, and N. E. West.
Utah Science, p 14-15, March 1972. 1 fig.

Descriptors: *Ecology, *Invasion, *Succession, *Deserts, *Forage grasses, *Utah, Desert plants, Livestock, Forage palatability, Grasses, Snow cover, Water supply, Distribution patterns, Moisture availability.
Identifiers: Winterfat, Dropseed, Shadscale, Greasewood, Halogeton, Russian thistle.

Utah's desert rangeland comprises 45 percent of the total land area and is an important source of forage for much of Utah's livestock industry, particularly during the winter months. Overgrazing, prior to the 1930's, severely reduced the more palatable plant species such as winterfat and dropseed grasses, while such species as shadscale, greasewood, halogeton and Russian thistle have become increasingly prominent. Snow provides much of the moisture, although it is unevenly distributed by strong winds. Snow surveys indicate that taller desert shrubs such as sagebrush and shadscale act as effective snow traps, while areas covered with lower growing plants are often blown clean of any snow cover. This water supply distribution is one factor in favor of the success of less desirable shrubs. (Bahre-Arizona)
W73-13310

PRAIRIE SANDREED (CALAMOVILFA LONGIFOLIA): WATER INFILTRATION AND USE,
Agricultural Research Service, Sidney, Mont.
J. K. Aase, and J. R. Wight.
Journal of Range Management, Vol 26, No 3, p 212-214, May 1973. 2 fig, 1 tab, 8 ref.

Descriptors: *Soil-water-plant relationships, *Forage grasses, *Consumptive use, *Infiltration rates, Soil water, Growth rates, Environmental effects, Runoff, Grazing, Range management, Soil texture, On-site investigation.
Identifiers: Great plains.

Prairie sandreed grows in nearly pure stands, resulting in distinct boundaries between the sandreed colonies and surrounding vegetation. Because of the distinct growth pattern of the forage species, an investigation of possible differences from the adjacent mixed prairie vegetation, particularly in soil profile and texture and water infiltration and water-use patterns, was conducted. Results of infiltration runs indicated that antecedent soil water in the top 30 cm of soil had no measurable effect on the relative infiltration rates. A comparison of rates on undisturbed prairie sandreed averaged four times higher than on undisturbed surrounding vegetation. When vegetation was clipped to soil surface, soil under prairie sandreed showed a significantly higher intake rate. When top 3 cm of soil was removed, infiltration was greatly reduced on both areas. The greater infiltration rate in prairie sandreed colonies causes vigorous growth. Results demonstrate the important role both living plants and litter play in the water budget of a plant community. Snow catch and water infiltration were increased by increasing plant cover. Determination of optimum grazing intensities should include not only the effects of foliage removal on the growth and survival of plants, but also the maintenance of an adequate plant cover. (Bahre-Arizona)

DEW: AN ADDITION TO THE HYDROLOGIC BALANCE OF DOUGLAS FIR,
Washington Univ., Seattle. Coll. of Forest Resources.
L. J. Fritschen, and P. Doraiswamy.
Water Resources Research, Vol 9, No 4, p 891-894, August 1973. 1 fig, 1 tab, 5 ref. NSF Grant GB20963.

Descriptors: *Water balance, *Hydrologic budget, *Douglas fir trees, *Dew, Evapotranspiration, Forests, Meteorology.

The hydrologic balance of a 28-meter Douglas fir tree in a weighing lysimeter was determined for 2 clear days in May 1972. Dew accumulations were 6.4 and 10.9 liters, which represent 15% and 20% of the 42.5 and 55.2 liters of evaporation from the tree. In the Pacific Northwest conditions are favorable for dew formation during most of the summer and fall. Thus dew formation could represent a large part of the hydrologic balance of fir forests. (Knapp-USGS)

STUDIES OF LANDSCAPE ECOLOGY OF THE NATURAL PROTECTION AREA 'ENTENFANG' NEAR WESSELING,
G. Bauer.
Decheniana. Vol 123, No 1/2, p 165-198. 1970 (1971). Illus.
Identifiers: Anas-Querquedula, *Landscape ecology, *Biotopes, Charadrius-Dubius, Chettusia-Gregaria, Coturnix-Coturnix, Ixobrychus-Minutus, Podiceps-Ruficollis, Saxicola-Torquata, *Germany (Wesseling).

The 'Entenfang' near Wesseling (West Germany) is located on an old bed of the Rhine. The diversity of the biotope is due to the food-rich waters, its position in a steppe-like open field landscape, the brief changes in water level, the wide areas of flat bank and the extensive reed stands. Nearby meadows and woodlands provide 'Entenfang' with further biotopes with typical plants and animals. The reed zone consists predominantly of the relatively rare Acoretum calami Schulz 40. The Typetum angustifolio-latifoliae (Eggl. 33; Schmale 39) also occurs. The Lemnetum gibbae Mijaw. et J. Tx. 60 occurs occasionally in the small still water bays. The flat banks are covered by the nitrophilous summer annual association of Bedention tripartiti Nordh. 40 and by Ranunculetum scelerati Siss. 46, Tx. 50. Meadows of this area belong to the Arrenatherum type and occur in fresher or drier associations depending on location. This area is rich in birds including 5 Podicipedidae species, 14 Anatidae species, 28 Limnicole species, 5 Laridae species, 3 Sternidae species and 5 Rallidae species. A number of birds rare to the Rhineland occur in this area. Chettusia gregaria was observed once in 1969. Ixobrychus minutus, Saxicola torquata, Podiceps ruficolis, Anas querquedula, Coturnix coturnix and Charadrius dubius are rare breeding birds. Plans for the maintenance and use of the area are presented.--Copyright 1973, Biological Abstracts, Inc.

STRUCTURE AND PROPERTIES OF WATER AND THEIR SIGNIFICANCE FOR BIOLOGICAL SYSTEMS, (IN CZECH),
Ceskoslovenska Akademia Ved, Prague. Inst. of Microbiology.
K. Sigler.
Biol Listy. Vol 37, No 2, p 98-112. 1972. Illus. English summary.
Identifiers: *Biological systems, Chemistry, Organisms, *Water properties, *Water structure.

Water, the universal medium for the overwhelming majority of biological processes, is frequently considered by practicing biologists as an inert solvent which does not significantly affect the processes in biological systems and the properties of which can be disregarded. Recently, evidence was accumulated that, on the contrary, water is one of the most important factors in a number of complicated chemical reactions, making the existence of living matter possible. The data presented represent but a fraction of the experimental material available on water and its properties which accrued from intensive research carried out recently in the field.--Copyright 1973, Biological Abstracts, Inc.

DATA ON THE WATER BALANCE OF SOME XEROTHERMIC TERRESTRIAL LICHENS,
National Museum of Natural History, Budapest (Hungary).
K. Verseghy.
Ann Hist Nat Mus Natl Hung. 63, p 83-97. 1971. Illus.
Identifiers: Cladonia-Convoluta, Cladonia-Furcata, Cladonia-Magyarica, Humidity, *Lichens, Parmelia-Pokornyi, *Xerothermic lichens, *Water balance, *Relative humidity.

The water uptake and release of Cladonia magyarica, C. furcata, C. convoluta and Parmelia pokornyi in water and water vapor at different relative humidities was different in each species. The amount of water uptake was dependent on the structure of the thallus or podetium. The amount of water absorbed or emitted was linearly correlated with the thickness of the upper and lower cortical layers. The entrance of water was inhibited by the gonidia layer and the acid crystals. At 70, 80 and 95% relative humidity, the water content of the lichens increased 12-14%. At 100% relative humidity the water content reached 60-70% in C. furcata, and 45-50% in the remaining species. Under standard conditions a water equilibrium occurred (within 1-2 min for water and several days for water vapor).--Copyright 1973, Biological Abstracts, Inc.

THE IMPORTANCE OF DISCOVERIES IN NEMATOLOGY TO HUMAN WELFARE.

Bioscience. Vol 22, No 4, p 237-239. 1972.
Identifiers: Animals, Human health, *Nematology, *Ecological balance, Parasites.

Nematodes are a widespread and extremely important group of animals. The parasitic forms are important in the health of man and animals and in theefficiency of agriculture. The free-living forms are known to be present in enormous numbers in soil and fresh water, and undoubtedly have major roles in maintaining the natural ecological balance. The role of the marine forms is almost entirely unexplored. Traditionally nematology has been partitioned into functional categories (e.g., animal parasites, plant parasites and free-living terrestrial and aquatic). Now researchers are moving from narrow specialities to broadly based ecological and chemical studies.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: *Leaves, Mentha Piperita, Moisture, Pigments, *Plastid pigments, Reproduction, Salvia-Sclarea, Soils, Water supply

The content of water, chlorophyll and carotenoids was determined in leaves of Salvia sclarea L. and Mertha piperita Huds. grown under conditions of constant and variable soil moisture in the reproductive period. The water supply under low soil moisture conditions was unchanged in leaves of S. sclarea, but decreased in M. piperita. Increased pigment formation was observed with low soil moisture, while variations in pigment content were found with variable moisture. A positive correlation was observed between the content of chlorophyll a and essential oil in leaves of the essential-oil-bearing plants.--Copyright 1973, Biological Abstracts, Inc.

ANCYROCEPHALUS DYKI N. SP. (MONOGENOIDEA: DACTYLOGYRIDAE) ON THE GILLS OF LEBISTES RETICULATUS,
Vysoka Skola Veterinarni, Brno (Czechoslovakia). Dept. of Parasitology and Invasive Diseases.
Z. Lucky.
Acta Vet. Vol 14, No 1, p 13-18. 1972. Illus.
Identifiers: Ancyrocephalus-Dyki, Dactylogyridae, Gills, *Lebistes-Reticulatus, *Monogenoidea, Species.

A new species of monogenetic fasciolae of the Ancyrocephalus family was ascertained on the gills of aquarium fish (Lebistes reticulatus) from aquariums of breeders from Brno. The marginal hooks of haptor of embryonal type measured 0.0007-0.012 mm, the over-all length of the dorsal central hooks reached 0.020-0.023 mm, the dimensions of their connecting plates 0.004-0.005 x 0.023-0.026 mm. The ventrally central hooks measured 0.018-0.026 mm and their connecting plates, 0.004-0.005 x 0.021-0.026 mm. The copulative organs are represented by a 3-fold spiral twisted copulative tube and indistinct membrane-like supporting organs. The chitin vaginal stiffening is 0.027-0.040 mm long. The monogenetic fasciolae were termed A. dyki.--Copyright 1973, Biological Abstracts, Inc.

THE HIPPOPHAE RHAMNOIDES ALLUVIAL FOREST AT LEINORA, CENTRAL NORWAY: A PHYTOSOCIOLOGICAL AND ECOLOGICAL STUDY,
Bergen Univ. (Norway). Botanical Museum.
A. Skogen.
K Nor Vidensk Selsk Skr. 4, p 1-115. 1972. Illus.
Identifiers: *Alluvial forests, Calcium, Ecological studies, *Forests, Hippophae-Rhamnoides, Light, *Norway, Phytosociological studies, Salinity, Soils, Hydrogen ion concentration.

The biology, distribution and autecology of H. rhamnoides, and the phytosociology and synecology of the extensive Hippophae thickets in the Gaula estuary are treated. Irrespective of the starting point, the vegetation develops into a paraclimax of dense Hippophae scrubs rich in nitrophilous species. After 50-70 yr Hippophae dies, causing disintegration of the community and finally a complete denudation of the banks, after which reestablishment occurs. Light conditions inside the thickets and the N supplied by Hippophae are decisive successional factors. Salinity, pH and Ca content of the soil are of minor importance. The very rich epiphytic flora of Hippophae is described.--Copyright 1973, Biological Abstracts, Inc.

CHANGES IN SPECIES COMPOSITION OF NITROPHILOUS EDGE ASSOCIATIONS IN STUDENY AND ROHACSKY VALLEYS IN THE LIPTAUER TATRA,
Ceskoslovenska Akademie Ved, Prague. Botanicky Ustav.
K. Kopecky.
Preslia (Praha). Vol 43, No 4, p 344-365, 1971. Illus.
Identifiers: Aegopodium-podagraria, Anthriscus-sylvestris, Armoracia-lapathifolia, Chaerophyllum-aromaticum, *Czechoslovakia (Liptauer Tara), *Nitrophilous edge associations, Rohacsky, Species, Studeny, Valleys.

Nitrophilous edge associations on the banks of the Studeny and Rohacsky brooks (Czechoslovakia) have undergone changes due to changing natural conditions at various elevations and due to the influences of man. Changes in composition are governed by the 1000 m difference in elevation between spring and estuary together with climatic and hydrological changes. The geographic habitat of the subassociations Petasitetum officinalis-glabrati chaerophylletosum aromatici, P. o.g. doronicetosum austriaci and Adenostyli-Athyrietum alpestris petasitetosum albae has not changed significantly with the exception of the shift of the first subassociation to higher elevations. Anthropic influences are noticeable especially in recreation areas and in settled areas. Some allochthonous species (Anthriscus sylvestris, Armoracia lapathifolia and others) appeared which were never identified before in this area. The habitat of other species (Aegopodium podagraria, Chaerophyllum aromaticum and others) shifted to higher elevations beyond their original geographic location.--Copyright 1973, Biological Abstracts, Inc.

AGE AND GROWTH OF THE 'RAINBOW TROUT' (SALMO GAIRDNERII IRIDEUS GIBBONS 1855) LIVING IN THE WATER VALLEY RESERVOIR OF THE HNILEC VALLEY, (IN CZECH),
Slovenske Polnohospodarske Akademie, Bratislava (Czechoslovakia). Laboratorium Rybarstva.
J. Holcik, and R. Zitnan.
Biologia (Bratisl). Vol 27, No 2, p 153-162, 1972. Illus. English summary.
Identifiers: Age, *Czechoslovakia, Growth, Hnilec, *Rainbow trout, Rate, Reservoirs, Salmogairdneri-irideus, Sex, Trout.

The age composition, sex composition and growth of the rainbow trout, S. g. irideus in the Hnilec water valley reservoir (East Slovakia (Czechoslovakia), Tisa river basin) were studied. Differences were found in sex composition in 1966 and 1967, in growth rate in these years and between both sexes and increasing growth rate in comparison with that in 1964. Maximal age found was 6 yr which is considered the boundary age of this species in this locality. The higher age also here is attained by females. The growth rate in the Hnilec reservoir is very high in comparison with North American populations.--Copyright 1973, Biological Abstracts, Inc.

DISTRIBUTION, STRUCTURE AND TROPHIC RELATIONSHIPS OF THE FISH POPULATION OF THE UPPER COURSE OF THE MURESH RIVER, (IN RUMANIAN),
Babes-Bolyai Univ., Cluj (Rumania).
S. Gyurko, and Z. I. Nagy.
Stud Cercet Piscic Inst Cercet Proiect Aliment. No 4, p 311-348, 1971. Illus.
Identifiers: Age, Alburnoides-bipunctatus, Alburnus-alburnus, Ancylus, Barbus-meridionalis-petenyi, Chondrostoma-nasus, Crayfish, Diptera, Distribution patterns, Ephemeroptera, Esox-lucius, Fish food, Gobio-gobio, Gobio-uranoscopus, Larvae, Leuciscus-cephalus, Lota-lota, Neomacheilus-barbatulus, Rivers, Rodents, *Romania Muresh River, Sex, Stenophagous, Structure, Thymallus-thymallus, Trichoptera, Trophic level, Vegetation.

The upper part of the Muresh River between its source and Toplitza (Romania) shows a combination of living conditions and a rich ichthyocenosis with 19 fish spp. having different ecological requirements. The predominant species is the broad snout (Chondrostoma-nasus). The occurrence of various age groups and sex ratios as a result of adaptation to specific living conditions are presented on tables. In the Lota lota population the younger fish (1-3 yr old) predominate, while in the Leuciscus cephalus population the older fish (7-12 yr old) predominate. In the Barbus meridionalis petenyi population younger fish up to 6 yr old predominate. In contrast to populations of other Transylvanian rivers where 4 yr old fish predominate, 5 yr olds of C. nasus predominate in this section of the Muresh. Studies of the food of these fish were made using quantitative methods. Esox lucius eats benthic fish species, almost exclusively. Young eelpouts (L. lota) make up 54.87% of the food of the pike. L. lota eats predominantly benthic fish including its own young (66.75%). A total 30.40% of its food consists of benthic insect larvae and other aquatic invertebrates. The chub population of this river is stenophagous, rather than euryphagous. Its food consists of rodents (40.53%) and river crayfish (29.36%). Vegetation is important in the food of B. m. petenyi, Alburnus alburnus and Alburnoides bipunctatus. Diptera, Ephemeroptera and Trichoptera larvae make up the food of Thymallus thymallus, Gobio gobio, Gobio uranoscopus and Noemacheilus barbatulus. Ancylus is important in the food of G. gobio and G. uranoscopus. Feeding areas of the individual species were determined on the basis of qualitative and quantitative composition of the food. The upper Muresh is so rich in food that food competition between fish is insignificant.--Copyright 1973, Biological Abstracts, Inc.

THE FLORA AND VEGETATION OF POND--BANKS IN THE SOUTHERN PART OF THE ENTRE-SAMBRE-ET-MEUSE,
J. Duvigneaud.
Nat Belg. Vol 53, No 1, p 2-18, 1972. Illus.
Identifiers: Banks, *Belgium (Moulin pond), Calcium, Carbonates, Conductivity, Entre-Sambre-Et-Meuse, *Flora, Ponds, Substratum, *Vegetation.

Moulin pond, situated SW of Rance, Belgium, has moderately high water mineral content, is basic with a clear predominance of Ca++ and HCO3 ions, has good conductivity, and is of medium biogenic capacity. Fourchine pond, near Villers-La-Tour and Seloignes, Belgium, has low mineral content, slightly acid or neutral water, is of weak biogenic capacity and low conductivity. Each has its own distinctive vegetation which is determined partly by the geological substratum.--Copyright 1973, Biological Abstracts, Inc.
W73-13615

CONTRIBUTION TO THE KNOWLEDGE OF SCIRPETUM SILVATICI IN CZECHOSLOVAKIA (WESTERN PART),
Ceskoslovenska Akademie Ved, Prague. Botanicky Ustav.
Z. Neuhauslova-Novotna, and R. Neuhasl.
Preslia (Praha). Vol 44, No 2, p 165-177, 1972. Illus.
Identifiers: Agrostis-canina, Cardamine-amara, Carex-spp, *Czechoslovakia, Glyceria-fluitans, Juncus-filiformis, Moisture, Ranunculus-flammula, *Scirpetum-silvatici, Scirpus-sylvaticus, Soils, Viola-palustris.

Scirpetum silvatici (alliance Calthion) is a meadow association which grows on creek banks and areas with waterlogged soil. In western Czechoslovakia it is a replacement association in damp to wet Alnion glutinoso-incane forests and comes in contact with various associations of inland areas. The soils of this association are severely influenced by a more or less mobile ground water which lies in the upper levels of the soil throughout the year. Scirpus silvaticus is the predominant species. The subassociation caricetosum with numerous differential species (including Carex species Ranunculus flammula, Viola palustris, Juncus filiformis and Agrostis canina) is the most frequent form of the Scirpetum silvatici. It grows on moorish soils

and wet gley with stagnant water. The subassociation typicum has no differential species. In the area investigated it is represented by a Glyceria fluitans formation with a tendency toward paludal associations (differential species G. fluitans and Cardamine amara). In Czechoslovakia, this association is most frequent in hercynian areas. It is rare in the western Czechoslovakian pannonian.--Copyright 1973, Biological Abstracts, Inc.
W73-13616

ON THE HELMINTH FAUNA OF FISHES IN THE SMALL DANUBE (IN CZECH),
Slovenska Akademie Vied, Kosice (Czechoslovakia). Helmintologicky Ustav.
R. Zitnan.
Helminthologia (Bratisl). 10, p 313-320, 1969 (1971), English summary.
Identifiers: Acanthocephala, Cestoidea, *Czechoslovakia (Danube River), *Fauna, Fishes, *Helminth, Hirudinea, Monogeneoidea, Nematoda, Piscivorous, Trematoda.

Fishes (40) belonging to 13 species coming from the Small Danube near Jahodna, Czechoslovakia were examined in May 1963. The following helminth species were found: 23 Monogeneoidea, 8 Cestoidea, 6 Trematoda, 4 Nematoda, 3 Acanthocephala and 2 Hirudinea. The majority of helminth species (34) was parasites in 1 host species only but Metagonimus yokogawai occurred in 10, Diplostomum spathaceum in 9 and Posthodiplostomum cuticola in 5 fish species. The largest number of helminth species was found parasitizing Leuciscus cephalus (12) and Alburnus alburnus (12), less in Abramis brama danubii; (10), L. idus (9), Blicca bjoerkna (9) and Esox lucius (8). From the epizootological point of view Dactylogyrus extensus, D. vastator, Tetraonchus monenteron, Gyrodactylus katharneri and G. medius and the larval stages of Diplostomum spathaceum are important. Posthodiplostomum cuticola and Ligula intestinalis whose definite hosts are piscivorous birds are of importance both in all fish-breeding farms of the Danube lowland and the planned dams of that region. Special attention from the epidemiological and epizootological standpoint should be devoted to the larval stages of M. yokogawai. The latter was found in 10 fish species, and they can infest not only men but also some domestic (pigs, cats and dogs) and fur animals.--Copyright 1973, Biological Abstracts, Inc.

WATER AND PHOTOSYNTHESIS RELATIONS OF DESERT PLANTS IN THE MAURITANIAN SAHARA: III. SMALL SHRUBS: HEMICRYPTOPHYTES AND GRASSES (IN GERMAN),
O. Stocker
Flora (Jena), Vol 161, No 1/2, p 46-110, 1972, Illus, English summary.
Identifiers: Abutilon-muticum, Africa, Aristida-pungens, Cassia-aschrek, Chrozophora-brocchiana, Citrullus-colocynthis, Corchorus-antichorus, Cucumis-melo, Deserts, Evolution, Grasses, Leaf, *Mauritanian Sahara, Morphology, *Photosynthesis, Primary production, Shrubs, Sporobolus-spigatus, Transpiration, Zygophyllum-waterloti, *Hemicryptophytes, *Desert plants.

Among the chamaephytes are trodden Cassia aschrek, with soft, pinnate leaves, Abutilon muticum, with soft, big, simple leaves, Chrozophora brocchiana, with smaller, slightly succulent leaves, Corchorus antichorus, prostrate with small leaves, and the succulent-leaved Zygophyllum waterlotii. They remain active in the dry period, with water turnover and photosynthetic production which, in Cassia and Corchorus, still surpass the records of the trees. Less adapted to the desert life is Abutilon with big and soft leaves. The hemicryptophytic turnip-rooted Citrullus colocynthis and Cucumis melo belong to a special type, which protects the juicy leaves from the heat-death by a strong transpiration. The dune-grasses Aristida pungens and Sporobolus spicatus are characterized by the minute regulation of the water-balance, characteristic of the grass-type. Aristida pungens possesses rolling-up leaves of highest perfection, and is able to maintain a positive photosynthesis on the base of a low but very economical transpiration, even during extreme dry periods. The different physiognomy of the Northern and Southern Sahara, Africa, i.e., diffuse bush- and contracted tree-desert, is the consequence of the different genetical and constitutional substance, which the northward and southward adjoining steppe and savanna vegetations had to offer for the evolution of the desert vegetation. A STUDY OF SEDIMENT TRANSPORT IN NORWEGIAN GLACIAL RIVERS, 1969,
Norsk Institutt for Vannforskning, Blindern.
G. Ostrem, T. Ziegler, and S. R. Ekman.
Alaska University Institute of Water Resources Fairbanks Publication No IWR-35, February 1973. 59 p, 29 fig, 20 ref. (Translated from Norway Institute of Water Resources Department of Hydrology Report 6/70, September 1970) OWRR A-042-ALAS(1).

Descriptors: *Sediment transport, *Glacial sediments, *Melt water, *Glaciers, Movement, Scour, Temperature, Rainfall, Summer, Data collections, Gaging stations, Streamflow, Sediment yield.
Identifiers: *Norway, *Glacial rivers.

The studies of transport of solid particles in Norwegian glacial rivers have a double purpose. First, the studies are useful for those who wish to exploit the water, either for the drinking purposes or for the production of electric power. Second, the studies have a scientific value, as the glaciers over a longer period have a great landscaping effect. Geographers and geomorphologists have always wished to obtain knowledge of the eroding velocity of glaciers. In this respect, studies of sediment transport in glacial rivers may furnish valuable information. The observation stations were placed as close as possible to the glacial front, at a point where the melt water is contained in one channel. The highest sediment concentration of the 1969 summer observation period was 3,037 mg/liter, measured on July 30, while the lowest concentration, 11 mg/liter, was measured August 25. The first high sediment concentrations and large daily transports for the observation period are associated with high daily mean temperatures, glacier ablation, and discharge from the glacier between June 17 and 27. The large transport during this period was mainly caused by erosion of sediment by the glacier. (Woodard-USGS)

REGIME, THEORY, AND METHODS OF CALCULATION AND MEASUREMENT OF SEDIMENTS AND WASTE WATERS (REZHIM, TEORIYA, METODY RASCHETA I IZMERENIYA NANOSOV I STOCHNYKH VOD).
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).

Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 191, A. V. Karaushev, and I. V. Bogolyubova, editors, Leningrad, 1972. 220 p.

Descriptors: *Sediments, *Sediment discharge, *Sediment yield, *Sediment transport, *Waste water (Pollution), Water pollution, Self-purification, Streams, Channels, Reservoirs, Discharge (Water), Sediment load, Suspended solids, Particle size, Particle shape, Settling velocity, Turbidity, Erosion, Statistical methods, Computers.
Identifiers: USSR, *European USSR, Competence (Streams).

Problems of sediment movement in streams and sediment measurement are discussed in this publication, the ninth in a series entitled 'Regime, Theory, and Methods of Calculation and Measurement of Sediments and Waste Waters,' prepared by workers of the sediment laboratory of Leningrad State Hydrologic Institute. Improved methods are presented for computing sediment transport in lowland and mountain streams and waste water dilution in rivers, and an optical method for measurement of turbidity in reservoirs is described. Investigations are made of suspended-load and bed-load discharges, size composition of bottom sediments, and settling velocity of natural sediment grains. Recommendations are given for computing sediment yield of ungaged rivers in European Russia. (See W73-13046 thru W73-13054) (Josefson-USGS)
W73-13045

SEDIMENT YIELD OF STREAMS IN EUROPEAN RUSSIA (STOK NANOSOV REK YEVROPEYSKOY TERRITORII SSSR),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
K. N. Lisitsyna, and V. I. Aleksandrova.
In: Rezhim, teoriya, metody rascheta i izmereniya nanosov i stochnykh vod; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 191, p 23-52, Leningrad, 1972. 4 fig, 7 tab, 23 ref.

Descriptors: *Sediment yield, *Sediment discharge, *Streams, Watersheds (Basins), Erosion, Geomorphology, Meteorology, Discharge (Water), Turbidity, Particle size, Suspended solids, Correlation analysis, Regression analysis, Variability, Equations, Curves, Maps.
Identifiers: *European USSR.

Division of European Russia into 9 erosion zones was based on observations of sediment yield at 206 stations in the area, excluding the Causcasus. Principal factors used to measure sediment yield were water discharge, channel slope, average basin elevation, density of the drainage network, and lake-surface and waterlogged areas of the river basin. Regression equations obtained by multiple linear correlation were used to calculate average annual sediment yield and average annual turbidity of streams. Variability and seasonal distribution of annual sediment yield are examined, and a map shows the particle-size distribution of suspended solids. Sediment yield of large rivers in the White, Barents, Baltic, Black, Azov, and Caspian Sea basins is tabulated. (See also W73-13045) (Josefson-USGS)
W73-13046

RELATION OF AVERAGE LONG-TERM SUSPENDED-SEDIMENT YIELD OF STREAMS IN EUROPEAN RUSSIA TO PHYSIOGRAPHIC FACTORS (ZAVISIMOST' SREDNEGO MNOGOLETNEGO STOKA VZVESHENNYKH NANOSOV REK YEVROPEYSKOY TERRITORII SSSR OT FIZIKO-GEOGRAFICHESKIKH FAKTOROV),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
N. N. Bobrovitskaya.
In: Rezhim, teoriya, metody rascheta i izmereniya nanosov i stochnykh vod; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 191, p 68-84, Leningrad, 1972. 3 fig, 3 tab, 34 ref.

Descriptors: *Sediment yield, *Sediment discharge, *Suspended solids, *Streams, *Geomorphology, Topography, Erosion, Watersheds (Basins), Discharge (Water), Correlation analysis, Regression analysis, Equations.
Identifiers: *European USSR.

Relation of average long-term suspended-sediment yield of streams to physiographic conditions in lowland regions of European Russia is analyzed. Six large erosion zones are identified on the basis of geomorphological delineation of the area and consideration of climatic factors. Analysis of suspended-sediment yield within zones is based on multiple correlation methods and consideration of differences in stream gradients and forested and plowed areas. Basic factors determining suspended-sediment discharge into streams are water discharge and geomorphological features of the region. (See also W73-13045) (Josefson-USGS)
W73-13047

CALCULATION OF SUSPENDED-SEDIMENT TRANSPORT BY MOUNTAIN STREAMS (K VOPROSU O RASCHETE TRANSPORTA VZVESHENNYKH NANOSOV GORNYMI REKAMI),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
I. V. Bogolyubova.
In: Razhim, teoriya, metody rascheta i izmereniya nanosov i stochnykh vod; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 191, p 85-99, Leningrad, 1972. 2 fig, 5 tab, 8 ref.

Descriptors: *Sediment transport, *Suspended solids, *Streams, *Mountains, Bottom sediments, Coarse sediments, Particle size, Turbidity, Curves, Equations.
Identifiers: USSR, Competence (Streams).

A method was proposed for applying the equation of sediment-saturated flow developed by A. V. Karaushev to calculation of the transporting capacity of mountain streams. The Karaushev method of calculating suspended-sediment transport can be used for mountain streams, where coarse sediments comprise a large percentage of bottom sediments and can substantially reduce stream capacity to transport suspended solids. W73-13048

EXPERIMENT IN DETERMINING TOTAL SEDIMENT DISCHARGE (SUSPENDED LOAD AND BED LOAD) (OPYT VYCHISLENIYA POLNOGO RASKHODA NANOSOV (VZVESHENNYKH I VLEKOMYKH)),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
K. V. Razumikhina.
In: Rezhim, teoriya, metody rascheta i izmereniya nanosov i stochnykh vod; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 191, p 100-110, Leningrad, 1972. 3 fig, 5 tab, 13 ref.

Descriptors: *Sediment discharge, *Suspended load, *Bed load, *Sediments, *Sediment transport, Bottom sediments, Suspended solids, Dunes, Particle size, Discharge (Water), Turbidity, Equations.
Identifiers: *European USSR, *Polomet' River.

Determination of bed-load discharges was based on dune movement of sediments in the Polomet' River at Yazhelbitsy. A ratio was obtained between bed-load and suspended-load discharges, and a determination was made of total sediment discharge. Recommendations are given for determining total sediment discharge on the basis of data on suspended-sediment discharges, dune movement of sediments, and particle-size composition of suspended and bottom sediments. W73-13049

EXPERIMENTAL INVESTIGATION OF SETTLING VELOCITY OF SEDIMENTS (EKSPERIMENTAL'NOYE ISSLEDOVANIYE GIDRAVLICHESKOY KRUPNOSTI NANOSOV),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
V. V. Romanovskiy.
In: Rezhim, teoriya, metody rascheta i izmereniya nanosov i stochnykh vod; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 191, p 111-136, Leningrad, 1972. 3 fig, 9 tab, 13 ref.

Descriptors: *Laboratory tests, *Settling velocity, *Sediments, *Sediment transport, Particle shape, Particle size, Stokes law, Viscosity, Suspension, Deposition (Sediments), Laminar flow, Turbulent flow, Reynolds number, Water temperature, Instrumentation, Measurement, Curves, Equations.
Identifiers: USSR.

Tests were conducted at the sediment laboratory of the Leningrad State Hydrologic Institute to study settling velocity of natural sediment grains and influence of grain shape on their settling rate. Settling velocity was measured for grains with a diameter ranging from 0.0004 cm to 7.5 cm. The relation of settling velocity to grain diameter and shape is graphed, and analytical expressions of settling velocity are presented for laminar and turbulent flow. (See also W73-13045) (Josefson-USGS)

VARIATIONS IN GRAIN SIZE OF BOTTOM SEDIMENTS IN LOWLAND AND MOUNTAIN STREAMS (IZMENCHIVOST' KRUPNOSTI DONNYKH OTLOZHENIY RAVNINNYKH I GORNYKH REK),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
G. A. Petukhova.
In: Rezhim, teoriya, metody rascheta i izmereniya nanosov i stochnykh vod; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 191, p 137-158, Leningrad, 1972. 8 tab, 25 ref.

Descriptors: *Bottom sediments, *Particle size, Streams, *Variability, *Sediment transport, Sampling, Statistical methods, Sediment sorting, Photography, Equations.
Identifiers: USSR, *Baksan River basin (USSR), *Don River (USSR).

Investigations were carried out in 1968-69 by the sediment laboratory of the Leningrad State Hydrologic Insitute to study size composition of bottom sediments in mountain streams of the Baksan River basin and in the Don River at Nikolayevskaya Station. Variations in grain size of bottom sediments depend on morphometric characteristics of the river reach and, presumably, on the direction of erosion-aggradational processes. The number of samples needed for reliable size analysis is derived statistically, and a recommendation is made for studying size composition of bottom sediments in mountain streams at low stages during free channel access. (See also W73-13045) (Josefson-USGS)
W73-13051

STUDY OF SUSPENDED SEDIMENTS IN RESERVOIRS BY THE METHOD OF SPECTRAL DIFFUSIVITY (IZUCHENIYE VZVESHENNYKH NANOSOV V VODOKHRANILISHCHAKH METODOM SPEKTRAL'NOY YARKOSTI),
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
A. G. Kal'ko.
In: Rezhim, teoriya, metody rascheta i izmereniya nanosov i stochnykh vod; Gosudarstvennyy Gidrologicheskiy Institut Trudy, No 191, p 159-171, Leningrad, 1972. 5 fig, 4 tab, 12 ref.

Descriptors: *Sediments, *Suspended solids, *Reservoirs, *Analytical techniques, Optical properties, Reflectance, Light, Turbidity, Particle size, Humus, Instrumentation, Measurement, Curves, Equations.
Identifiers: USSR, *Spectral diffusivity.

Application of the method of spectral diffusivity to study of fine-grained suspended sediments was based on investigations carried out at the Kayrakkum, Dubossary, and Minchegaur Reservoirs and on the Polomet' River in 1966-68. Changes in the curve of spectral diffusivity coefficients are associated with turbidity, suspended-sediment size, presence of humus substances, and reflectance of suspended material. The method is promising for studying turbidity in surface layers of water bodies and will be useful in studying plan structure of flows in reservoirs and lakes provided the water masses transported by flows differ in their optical properties. POSTDEPOSITIONAL OSMOTIC ADJUSTMENTS IN SEDIMENTS FROM SOAP LAKE, WASHINGTON,
Duke Univ., Durham, N.C. Dept. of Zoology.
M. A. Mantuani.
Limnology and Oceanography, Vol 18, No 3, p 403-413, May 1973. 6 fig, 17 ref.

Descriptors: *Pore water, *Bottom sediments, *Salinity, *Osmosis, Connate water, Mass transfer, Diffusion, Alkalinity, Chemical potential, Ion exchange, Clay minerals, Diagenesis, Water chemistry, *Washington.
Identifiers: *Soap Lake (Wash).

Sediments from Soap Lake, an alkaline saline lake on the arid Columbia Plateau, demonstrate postdepositional changes in response to a measured osmotic potential gradient through the sediment. The primary mechanism for osmotic readjustment is redistribution of water and dissolved ions through the sediment, altering sediment water content and pore water salinity. This redistribution provides a mechanism for mobilizing ions from exchange sites and from minerals to form pore waters of altered composition. (Knapp-USGS)

RECONNAISSANCE SURVEY OF HOG ISLAND, PRINCE EDWARD ISLAND,
McMaster Univ., Hamilton (Ontario).
S. B. McCann.
Maritime Sediments, Vol 8, No 3, p 107-113, December 1972. 9 fig, 1 tab, 6 ref.

Descriptors: *Waves (Water), *Ocean waves, Beach erosion, Winds, Surf, Refraction (Water waves), Fetch.
Identifiers: *Gulf of St. Lawrence.

Hog Island, on the north coast of Prince Edward Island, is a 10-mile long barrier island which separates Malpeque Bay from the open waters of the Gulf of St. Lawrence. The island exhibits all the characteristic features of the sand beach and dune barriers of Prince Edward Island and, being relatively inaccessible, is in a fairly natural state. Basically it consists of a series of vegetated dune ridges, with associated marsh areas at the rear, the continuity of the main dune ridges being broken by two large washover fans. The end of the island has undergone considerable changes since 1935, the main trend being an extension of the shoreline for 600 ft in a southeast direction. There has been an associated 200-ft extension of the dune area in this direction, but this has been accompanied by a marked retreat of the seaward dunes. Size frequency curves for the beach foreshore, breaker zone, trough (closest to the offshore bar), offshore bar, dune and two lagoon samples were plotted on arithmetic probability paper. All the samples illustrated have one dominant component (saltation population) but differ in the presence or absence of secondary components (traction or suspension populations). (Knapp-USGS)

BARRIER ISLANDS, SAND SPITS AND DUNES IN THE SOUTHERN GULF OF ST. LAWRENCE,
McMaster Univ., Hamilton (Ontario).
S. B. McCann, and E. A. Bryant.
Maritime Sediments, Vol 8, No 3, p 104-106, December 1972. 13 ref.

Descriptors: *Beaches, *Sand bars, *Sand spits, *Dunes, Canada, Waves (Water), Littoral drift, Sedimentation, Beach erosion.
Identifiers: *Gulf of St. Lawrence, *Prince Edward Island.

Many miles of the northern coast of Prince Edward Island and the eastern coast of New Brunswick consist of long sand beaches fronting narrow barrier islands or sand spits, some of which have well developed dunes. The present barrier island systems probably originated at the lower sea levels of the Holocene as coastal beaches and spits which were able to build up significant dunes and beach deposits. As sea level rose the land behind these dunes was flooded forming lagoons. The beaches and dunes then underwent shoreward retreat as sea level continued to rise. The barrier islands thus represent a dynamic equilibrium between the slope of the land, the rise of sea level, and the intensity of wave attack. Over the past 150 years the Kouchibougauc barriers show evidence of frequent breaching of the islands and infilling of inlet systems that is a response to the wave refraction patterns of storm waves and the subsequent redistribution of sediment along the coastline. Not only are the barrier islands changing shape they are also being pushed shorewards as evidenced by accurate charts since 1839 and good aerial photographs since 1930. (Knapp-USGS)

A SEDIMENT SQUEEZER FOR REMOVAL OF PORE WATERS WITHOUT AIR CONTACT,
California Univ., Los Angeles. Dept. of Geology.
E. K. Kalil, and M. Goldhaber.
Journal of Sedimentary Petrology, Vol 43, No 2, p 553-557, June 1973. 4 fig, 11 ref. AEC Grant AT (04-3)-34 P.A. 134.

Descriptors: *Pore water, *Connate water, *Sediments, *Sampling, *Sedimentology, *Equipment, *Laboratory equipment.
Identifiers: *Pore water squeezer.

A low-pressure mechanical squeezer was designed for removing interstitial water from ocean sediments with only minimal or no air contact. The plastic liner in which the sediment was collected serves as the squeezing chamber, reducing oxidation of sulfides and gas exchange of CO2. Pore water is collected from both ends of a 10-cm section of core, increasing squeezing efficiency. The system is easily thermoregulated to operate at bottom temperatures. As this squeezer is inexpensive and easy to build, several units may be operated at once. (Knapp-USGS)

A VIBRATORY CORING SYSTEM FOR CONTINENTAL MARGIN SEDIMENTS,
Rhode Island Univ. Kingston. Graduate School of Oceanography.
R. L. McMaster, and C. E. McClennen.
Journal of Sedimentary Petrology, Vol 43, No 2, p 550-552, June 1973. 1 fig, 5 ref. ONR Contract N00014-68-A-0215-0003.

Descriptors: *Sampling, *Cores, *Core drilling, *Continental shelf, *Bottom sediments, Equipment, Sedimentology.
Identifiers: *Core drill (Vibratory).

A vibratory coring system was developed to sample sands on continental margins for more detailed data concerning sedimentary processes. It consists of three vibration mechanisms with attached 2 m coring tubes, a battery powered energy source, and a locking compass for orientation. Coring units, 2 m apart, are located at the apices of a triangular platform. Field tests indicate that the system is operational at all depths on the continental shelf. (Knapp-USGS)

A SPLITTER FOR UNCONSOLIDATED CORES TAKEN IN PLASTIC LINERS,
Rosenstiel School of Marine and Atmospheric Sciences, Miami, Fla.
T. W. Durden, and H. Frohlich.
Journal of Sedimentary Petrology, Vol 43, No 2, p 521-524, June 1973. 2 fig, 2 ref. ONR N0014-67-A-0201-0013 NSF GA-15226 and GA 25016.

Descriptors: *Sampling, *Cores, *Equipment, Sedimentology, Sediments, Analytical techniques, Laboratory equipment.
Identifiers: *Core splitter.

An inexpensive machine was developed to split (longitudinally) cores of uncolsolidated sediments without extruding them from the plastic tubing in which they were collected. This machine has four main advantages: (1) minimal amount of core disturbance, (2) speed and simplicity of operation, (3) accommodation of cores of various lengths and diameters, and (4) portability. The method of operation begins by mechanically pushing a core in its linear, laid in a V-shaped trough, through a set of gas burners which are diametrically opposed in a plane vertical to the trough. This step slightly heats the plastic liner along a thin line on opposite sides of the liner. Immediately following the burners is 0.045-inch diameter piano wire strung in the same plane as the burners. After the liner emerges from the burners the soft plastic is easily cut by the piano wire and the core and liner are sliced into equal halves. (Knapp-USGS)
W73-13535

SIEVE LOAD EQUATIONS AND ESTIMATES OF SAMPLE SIZE,
California State Univ., Sacramento. Dept. of Geology.
N. C. Janke.
Journal of Sedimentary Petrology, Vol 43, No 2, p 518-520, June 1973. 4 ref.

Descriptors: *Sedimentology, *Sieve analysis, Equations, Sampling, Particle size, Particle shape.
Identifiers: *Sieve loads.

A semi-empirical expression for sieve loads is given in terms of the sieve aperture in mm and the phi interval between sieves. The acceptable load on a 1.00-mm sieve, whether it is used or not, is given in terms of weight density, a shape factor, long and short particle intercepts, the number of finer near-mesh particles, and a parameter that varies with the internal diameter of the sieve. Equations for sieve loads can also be an aid in estimating sample size. (Knapp-USGS)
W73-13536

THE SIGNIFICANCE OF THE SOLUTION OF FELDSPAR IN POROSITY DEVELOPMENT,
West Virginia Univ., Morgantown. Dept. of Geology and Geography.
M. T. Heald, and R. E. Larese.
Journal of Sedimentary Petrology, Vol 43, No 2, p 458-460, June 1973. 1 fig, 1 tab, 5 ref.

Descriptors: *Porosity, *Pores, *Mineralogy, *Weathering, *Diagenesis, Groundwater movement, Groundwater.
Identifiers: *Feldspars.

Post-depositional solution of feldspar is an important process in porosity development in some formations. Solution is very selective and may result in considerable reduction in the amount of feldspar and significant change in proportion of feldspar types. (Knapp-USGS)
W73-13537

THE ORIGIN AND SIGNIFICANCE OF SOME DOWNCURRENT-DIPPING CROSS--STRATIFIED SETS,
Keele Univ. (England). Dept. of Geology.
N. L. Banks.
Journal of Sedimentary Petrology, Vol 43, No 2, p 423-427, June 1973. 6 fig, 11 ref.

Descriptors: *Sedimentary structures, *Stratification, *Ripple marks, Alluvial channels, Bed load, Sand waves, Dunes.
Identifiers: *Norway.

Downcurrent dipping sets of cross stratification occur in late Precambrian fluvial sandstones in northern Norway. The sets form cosets up to 4 m thick. The sets are wedge shaped or lens shaped, dip at less than 8 deg relative to the horizontal, and have erosive boundaries. The geometry of the sets suggests that they were formed by the migration of large scale ripples over a bed which was wavy on a scale larger than that of the ripples. This wavy bedform was also moving downcurrent but at a slower rate than the ripples. It is estimated that the downstream faces of the wavy bedforms dipped at less than 11.5 deg and that the ripples moved at least 3.2 times as fast as the waves. The waves may be comparable with either the major midchannel waves or the side bars of some modern streams. (Knapp-USGS)
W73-13538

OSTLER LENSES: POSSIBLE ENVIRONMENTAL INDICATORS IN FLUVIAL GRAVELS AND CONGLOMERATES,
Guelph Univ. (Ontario). Dept. of Land Resource Science.
I. P. Martini, and J. Ostler.
Journal of Sedimentary Petrology, Vol 43, No 2, p 418-422, June 1973. 8 fig, 1 tab, 7 ref.

Descriptors: *Sedimentary structures, *Bed load, *Sediment transport, Sand bars, Braiding, Turbulent flow, Alluvial channels, Gravels.
Identifiers: Ostler lenses.

The Ostler lens is a sedimentary structure observed in recent and ancient coarse gravelly sequences. In recent environments they are small dunes, mounds, or small transverse bars made up of rounded, sorted small pebbles. They are found in streams carrying predominantly coarse gravel to fine pebble materials, usually in shallow reaches at the downstream end of braid islands, bars, and point bars. Ostler lenses record essentially unidirectional to slightly convergent flow and turbulent lower flow regime conditions for the riffle (shallower) parts of alluvial channels. (Knapp-USGS)

HEAVY MINERALS OF HORN ISLAND, NORTHERN GULF OF MEXICO,
Louisiana State Univ., Baton Rouge. Dept. of Geology.
W. E. Harrison.
Journal of Sedimentary Petrology, Vol 43, No 2, p 391-395, June 1973. 3 fig, 2 tab, 7 ref.

Descriptors: *Mineralogy, *Provenance, *Sand bars, *Gulf of Mexico, *Mississippi, Metamorphic rocks, Sediment transport, Rivers, Littoral drift.
Identifiers: *Heavy minerals.

The heavy mineral assemblage of Horn Island, a barrier island in the northern Gulf of Mexico 8-10 miles off Mississippi, is diagnostic of a metamorphic source area. The crystalline metamorphic region in east-central Georgia which is drained by the South Alabama and Apalachicola Rivers and their respective tributaries is suggested as the ultimate source area for the heavy minerals. (Knapp-USGS)

OCEANIC SEDIMENTS AND THEIR DIAGENESIS: SOME EXAMPLES FROM DEEP-SEA DRILLING,
Scripps Inst. of Oceanography, La Jolla, Calif. Deep Sea Drilling Project.
T. A. Davies, and P. R. Supko.
Journal of Sedimentary Petrology, Vol 43, No 2, p 381-390, June 1973. 13 fig, 30 ref.

Descriptors: *Bottom sediments, *Oceans, *Sampling, *Stratigraphy, *Diagenesis, Cores, Mineralogy, Sedimentary rocks, Geochemistry.

Cores collected by drilling in the deep ocean provide samples of deeply buried ocean sediments in the process of becoming sedimentary rocks. Carbonate sediments have been dominant in deep-sea sediments since at least the Jurassic, except during the Eocene when siliceous sediments became dominant. The sonic velocity is consistently lower than the velocity determined from refraction measurements. A sequence of diagenetic changes progresses from breakup of individual coccoliths to solution and recementation. Dolomite rhombs are related to either igneous activity, to evaporitic conditions prevailing in the past, or to geochemical control in a reducing environment. Chert, both nodular and bedded, is reported from both the North Atlantic and Pacific oceans, but not the South Atlantic. Chert is associated with all lithologies and ages of sediment but is most common in siliceous sediments of Eocene or older age. The silica in nodular cherts is biogenic in origin. Basal sediments in the oceans are commonly enriched in iron. The iron-rich sediments formed when the basement was near the crest of the mid-ocean ridge and have moved to their present positions by seafloor spreading. (Knapp-USGS)

NEW JERSEY CONTINENTAL SHELF NEAR BOTTOM CURRENT METER RECORDS AND RECENT SEDIMENT ACTIVITY,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
C. E. McClennen.
Journal of Sedimentary Petrology, Vol 43, No 2, p 371-380, June 1973. 5 fig, 1 tab, 41 ref.

Descriptors: *Continental shelf, *Bottom sediments, *Sedimentary structures, *Sediment transport, *Sedimentation, *New Jersey, Scour, Erosion, Littoral drift, Waves (Water), Currents (Water), Current meters.

Modern sedimentary processes associated with the ridge and depression topography of the New Jersey continental shelf were investigated with the aid of near bottom current meter measurements. Estimates of near bottom wave orbital velocities were derived from classical wave theory and

available surface wave observations. Four current meters were set 1.5 to 2.0 m above sea bottom in 30-, 59-, 74-, and 143-m depths for 9 to 11 days during the late springs of 1970 and 1971. The root mean square speeds of the meter records were 13.7, 11.8, 12.9, and 19.5 cm/sec in order of increasing depth, with a maximum recorded 2.5 minute average speed of nearly 40 cm/sec and a net southwesterly transport. Both current and wave data indicate reworking of the surface sand cover on the shelf. In determining the relative importance of wave vs current activity, the true value of the critical erosion velocity is of primary importance. The present physical reworking of the surface sediments is indicated independently by bottom photographs of ripples and by sedimentary structures, with reworking generally limited to the upper meter of sediment. No mechanism for the present formation of the larger scale ridge and depression topography is indicated by the currents measured or the wave considerations. (Knapp-USGS)

A REACTIVE SILICATE BUDGET FOR THE ARCTIC OCEAN,
Washington Univ., Seattle. Dept. of Oceanography.
L. A. Codispoti, and D. Lowman.
Limnology and Oceanography, Vol 18, No 3, p 448-456, May 1973. 3 fig, 2 tab, 27 ref. ONR N-00014-67-A-0103-0014.

Descriptors: *Arctic Ocean, *Sea water, *Silicates, *Silica, *Water chemistry, Aqueous solutions, Provenance, Water circulation, Ocean currents.

Available data permit formulation of a reactive silicate budget for the Arctic Ocean. There is fairly good agreement between the input and removal terms. Arctic rivers do not appear to have unusually high reactive silicate concentrations and the budget indicates that the Arctic Ocean is not a major source for reactive silicate; it could even be a sink. The Bering Strait inflow may exit primarily via the Canadian Archipelago. (Knapp-USGS)

A NEW METHOD FOR DETERMINING THE TOTAL CARBONATE ION CONCENTRATION IN SALINE WATERS,
Lamont-Doherty Geological Observation, Palisades, N.Y.
H. J. Simpson, and W. S. Broecker.
Limnology and Oceanography, Vol 18, No 3, p 426-440, May 1973. 11 tab, 13 ref.

Descriptors: *Chemical analysis, *Water analysis, *Carbon dioxide, *Carbonates, *Saline water, Aqueous solutions, Water chemistry, Analytical techniques.
Identifiers: *Carbonate analysis.

A new method of determining total carbonate ion content of saline waters requires measurement of the partial pressure of carbon dioxide gas (P CO2) in equilibrium with an initial solution, plus two more P CO2 measurements made after adding a known amount of strong base and after further adding boric acid. These three P CO2 measurements, plus the total inorganic carbon concentration are used to compute the total carbonate ion concentration of the original solution, without the use of any system of apparent dissociation constants. Experimental data for seawater samples using this method yield total carbonate ion concentrations in agreement with those calculated using Lyman's apparent dissociation constants for carbonic and boric acids. The method can be equally well applied to other saline natural waters. (Knapp-USGS)

NUTRIENT CONTENT OF LITTER FALL ON THE HUBBARD BROOK EXPERIMENTAL FOREST, NEW HAMPSHIRE,
New Mexico Univ., Albuquerque. Dept. of Biology.
J. R. Gosz, G. E. Likens, and F. H. Bormann.
Ecology. Vol 53, No 5, p 769-784, 1972. Illus.
Identifiers: Cycling, Forests, *Litter fall, *Nutrients, Seasonality, *New Hampshire (Hubbard Brook Exp. Forest).

Litter fall was collected throughout the year beneath a mature northern hardwood forest in New Hampshire. The material, separated by species and plant part, was analyzed for dry weight and for 11 elements. Total aboveground litter fall averaged 5702 kg/ha per year; leaves, branches, stems, and bark contributed 49.1%, 22.2%, and 14.1% and 1.7% respectively. Other deciduous structures (i.e., bud scales, flowers, fruit), as well as insect frass and miscellaneous tissue, contributed 10.9%. The overstory contributed 98.0% of the total, and shrub and herbaceous layers contributed only 1.2% and 0.8%, respectively. The nutrient content of the litter totaled 140.4 kg/ha per year. The relative abundance was N > Ca > K > Mn > Mg > S > P Zn > Fe >Na > Cu. Nitrogen, Ca, and K accounted for 80.6% of the total, and Zn, Fe, Na and Cu contributed only 0.8%. The overstory, shrub, and herbaceous layers supplied 96.9%, 1.7% and 1.6% of the nutrients, respectively. Litter fall occurred throughout the year, but there were seasonal peaks for many types of tissues. Autumn was most important, accounting for 49.7% of the litter and 56.0% of the nutrients. Summer and winter seasons supplied similar quantities of litter, 21.2% and 22.4%; however, 22.6% of the total nutrient fall occurred during summer compared with only 17.2% during the winter. Spring months supplied 6.7% and 4.1% of litter and nutrients, respectively. Storms were very important in the timing of litter and nutrient fall. The extreme variability of litter fall is the result of differences between species, tissues, vertical structure of the vegetation, elevation, site and time of year. In spite of this variation, nutrient-budget studies reveal relatively small losses from the ecosystem. Large fluctuation in rates of nutrient flow, via litter fall, are readily absorbed within the ecosystem, thus preventing nutrient loss and maintaining efficient nutrient cycling.--Copyright 1973, Biological Abstracts, Inc.

The responses of silicone-rubber based ion-selective membrane electrodes (iodide and silver ion-selective electrodes) to low concentrations of primary ions have been studied in various unbuffered media. In particular, the failure region of the electrodes was studied. Reproducible and accurately known concentrations of ions (0.1-0.0007 mM were prepared by electrolytic generation. A necessary and integral part of the work was to measure the current efficiency for the generation of the ions in the different media. Such efficiencies were measured coulometrically. Results obtained from the calibration of the iodide-ion selective electrode

in various media are presented, and results with the silver and copper ion-selective electrodes are briefly discussed. The advantages of the electrolytic generation technique are discussed. (Holoman-Battelle)

QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1968: PART II. PACIFIC SLOPE BASINS IN CALIFORNIA.
Geological Survey, Washington, D.C.

Available from GPO, Washington, D.C. 20402. Price $2.75. Geological Survey Water-Supply Paper 2099, 1972. 359 p, 1 fig, 39 ref.

Descriptors: *Water quality, *Chemical analysis, *Surface waters, *California, Basic data collections, Hydrologic data, Water chemistry, Streamflow, Flow rates, Sediment transport, Particle size, Sediment yield, Water temperature.

During the water year ending September 30, 1968, the Geological Survey maintained 184 stations on 123 streams in California for the study of chemical and physical characteristics of surface water. Samples were collected daily and monthly at 62 of these locations for chemical-quality studies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 115 and daily at 29 stations. At chemical-quality stations where data are continuously recorded at the stream site (monitors), the records consist of daily maximum, minimum, and mean values for each constituent measured. Quantities of suspended sediment are reported for 57 stations. Sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. Particle-size distributions of sediments were determined at 54 stations. Daily water temperatures were measured at most of the stations at the time samples were collected for chemical quality or sediment content. (Woodard-USGS)

Identifiers: *Electrochemical probe, Ionic diffusion, Carbonate saturation, Chemical composition, Glass electrodes.

These studies were primarily concerned with the investigation of carbonate saturation in the ocean by the application of an in situ probe. The method involved the construction of an electrochemical measurement system which was used to depths of 4,500 m. A glass electrode was allowed to reach equilibrium with a calcium carbonate suspension and the changes in pH were measured. This pH change could then be related to the degree of saturation of the carbonate in seawater. Studies also were undertaken to measure ionic diffusion from seawater to less dilute solutions. It was established that ionic complexing may extensively modify the fluxes of migrating ions. Theoretical studies were conducted on the effect of complexing on the apparent dissociation constants in the carbonate system. It was shown that these could change sig-

nificantly in interstitial waters having approximately the same ionic strength of seawater, but a different composition. A study was also made of the CO2-O2 system in the North Eastern Pacific. Variations in CO2 and O2 were related to production and consumption rates and to mixing models of ocean currents. (Mortland-Battelle)

A seabed nuclear probe has been developed which permits the measurement of up to 33 elements at the parts per thousand to parts per million levels in continental shelf areas. These elements include S, Ca, Cl, Mo, Mg, Al, F, K, Na, In, Ga, Nd, Ni, Co, Cu, Ba, Sn, V, I, Eu, Ti, Cb, W, Sb, Dy, Ag, Os, Br, Rh, Pt, La, Ir, and As. The probe consists of a neutron irradiation source, californium-252, which neutron activates the elements in the minerals of interest. These resulting radio-active elements emit characteristic gamma radiation which is analyzed in situ in 2- to 10-minute counting intervals with a Ge (Li) detector system. Details of the irradiation source, the Ge (Li) detector, and spectra taken in situ in a marine environment are discussed with respect to the detection of the minerals at concentrations of economic interest. RELATIONSHIP BETWEEN THE CARBON ISOTOPE COMPOSITION OF SOIL CO2 AND DISSOLVED CARBONATE SPECIES IN GROUNDWATER,
Geological Survey, Washington, D.C.
C. T. Rightmire, and B. B. Hanshaw.
Water Resources Research, Vol 9, No 4, p 958-967, August 1973. 4 fig, 3 tab, 29 ref.

Descriptors: *Stable isotopes, *Carbon, *Isotope fractionation, *Water chemistry, *Hydrogeology, Groundwater, Groundwater movement, Provenance, Climatology, Tracers, Florida, Soil water, Soil gases.
Identifiers: *Carbon isotopes.

To understand the carbonate geochemistry of an aquifer system, it is helpful to determine the sources of carbon in the dissolved carbonate species. Samples of ground litter, soil organic matter, soil CO2, and groundwater were collected in the area of recharge to the principal artesian aquifer of central Florida and were analyzed for C-13 content. Analytical results yield consistent C-13/C-12 values for soil organic matter; delta C-13 (PDB) ± 23 plus or minus 1 part per thousand. The C-13/C-12 ratio of the litter samples ranges from delta C-13 (PDB) of -18.2 to -29.5 parts per thousand and indicates the presence of both Calvin and Hatch-Slack cycle plants. The C-13/C-12 of the soil CO2 ranges from -14.7 to -21.3 parts per thousand, which is consistent with the trend observed in the litter. The relationship between C-13/C-12 of the dissolved carbonate and the percent calcite saturation indicates that the C of the source CO2 is within the range expected for a humid, subtropical environment. Descriptors: *Karst hydrology, *Water chemistry, Water analysis, Geochemistry, Statistics, Carbonate rocks, Hydrogeology, *Pennsylvania.

Waters within a carbonate aquifer may be classified on a hydrologic basis. To test the classification method, 166 reliable chemical analyses of carbonate waters from Pennsylvania were grouped on a hydrologic basis, and the groupings were tested by a stepwise linear discriminant function analysis. Two parameters (degree of calcite saturation and equilibrium carbon dioxide partial pressure) are sufficient to distinguish the groups at the 0.005 confidence level and provide a reliable way to examine the geochemical evolution of the waters in the carbonate drainage basin. Hydrographic station data consisting principally of temperature and salinity determinations probably contain substantially more information than has been derived from them in the past. The quantity that is orthogonal to potential-density curves in the Theta S plane is suggested as a useful variable to complement the information contained in potential density. A polynomial expression that is suitable for computer calculations is derived from hydrographic station data. Examples of hydrographic data from the Atlantic are plotted on an orthogonal variable - potential density diagram showing many features exhibited in the temperature-salinity plane. Vertical sections of the variable provide information about mixing in different parts of the Atlantic. The variable may serve as a good tracer for abyssal water movements. An exploration of the dynamical significance of potential density is presented beginning with the question of stability of abyssal water. Examples show that analysis of potential density alone can lead to incorrect conclusions because seawater is a multicomponent thermodynamic system and the thermodynamic coefficients are functions of pressure, salinity, and temperature. A local potential density is derived which gives a precise picture of gravitational stability in the vertical direction. (Jerome - Vanderbilt)

CHANGE IN THE FREE AMINO ACID CONTENT IN CRYPTOMERIA JAPONICA TRANSPLANTS UNDER VARIOUS SOIL MOISTURE CONDITIONS,
Government Forest Experiment Station, Tokyo (Japan).
T. Mori, Y. Sakagami, and K. Doi.
J Jap For Soc. Vol 53, No 11, p 350-354. 1971. Illus

Identifiers: Alanine, *Amino acid, Aspartic-acid, Chromatography, *Cryptomeria-Japonica, Glutamic-Acid, Metabolism, Proline, *Soil moisture, Transplants.

Fourteen amino acids and 2 amides were separated from 80% ethanol extracts of the shoots and roots by the paper chromatographic method. Alanine, proline, aspartic and glutamic acids comprised 70 approximately 80% of the total amino acids. In the shoots, the total amino acid concentration increased until the water content in the shoots declined to about 120%. Further decline of water content did not cause any significant change in the total amino acid concentration. In the roots, the concentration continued to increase during the decrease of water content. Alanine and proline in the shoots increased under water stress with water content lower than 120%, while almost all other amino acids decreased after they reached the maximum levels at about 120% of the water content. Proline in the upper shoots increased, more than 10-fold of the original level, with the decrease of water content. Moderate soil moisture deficit caused an extreme decrease of water content in the transplants, and water stress in the transplants seemed to strongly influence the amino acid metabolism.--Copyright 1973, Biological Abstracts, Inc.

HYDROLOGICAL CHEMICAL AND PHYSICAL INVESTIGATIONS ON THE ADIGE RIVER AT BOARA PISANI. JUNE 1968-JUNE 1970,
Istituto di Biologia del Mare, Venice (Italy).
V. U. Fossato.
Arch Oceanogr Limnol. Vol 17, No 2, p 105-123. 1971. Illus. English summary.
Identifiers: Chemical studies, Hydrological studies, *Italy (Adige River), Minerals, *Nutrients, Physical studies, Rivers, *Calcium, *Magnesium.

The nutrients of the river Adige to the Adriatic Sea and the seasonal variations of alkalinity and of Ca and Mg concentrations were investigated bimonthly for 2 yr Boara Pisani. Statistically significant correlations between the flow of the river and the concentrations of some nutrients (nitrites, nitrates and phosphates) could be shown. The nutrient concentrations and the relative oxygenation seemed to indicate a low pollution level in this river. A correlation was also found between the seasonal changes in total alkalinity, in Ca and Mg concentrations, and in the flow and temperature of the river. This is explained by the hypothesis that CO2 causes a slow transformation of the insoluble carbonates into soluble bicarbonates.--Copyright 1973, Biological Abstracts, Inc.

HYDROLOGICAL, CHEMICAL AND PHYSICAL INVESTIGATIONS ON THE PO RIVER AT POLESELLA: JUNE 1968-JUNE 1970,
Istituto di Biologia del Mare, Venice (Italy).
V. U. Fossato.
Arch Oceanogr Limnol. Vol 17, No 2, p 125-139. 1971. English summary.
Identifiers: Chemical studies, Hydrological studies, Minerals, *Nutrients, Physical studies, Rivers, *Italy (Po River), *Calcium, *Magnesium.

The nutrients of the Po River to the Adriatic Sea and the seasonal variations in alkalinity and in Ca and Mg concentrations were investigated bimonthly for 2 yr at Polesella. The nutrient concentrations were very variable. A correlation existed between the seasonal changes in total alkalinity and in Ca and Mg concentrations, and in flow and temperature of the river.--Copyright 1973, Biological Abstracts, Inc.

2L. Estuaries

THE COASTAL ZONE AS AN INTEGRAL ELEMENT OF WATER-RESOURCE SYSTEMS,
Florida State Univ., Tallahassee. Dept. of Urban and Regional Planning.
A. A. Dzurik.
Water Resources Bulletin, Vol 9, No 4, p 735-745, August 1973. 3 fig, 3 tab, 10 ref.

Descriptors: *Coasts, Water management (Applied), *Estuaries, *Planning, Water resources development, Comprehensive planning, Multiple-purpose projects.

The coastal zone is subject to more severe problems and complex issues than more narrowly-defined land and water resources. It must be viewed as an important component of water-resource systems. Generally defined, the coastal zone is the area of transition from land to sea, and from freshwater to saltwater. Estuaries are the key element of this zone and are the world's most biologically productive water bodies. Freshwater flow has impact upon the characteristics and quality of estuarine waters, and upon sedimentary deposits along the coast. Man has and will continue to concentrate his activities and cities along the coasts. The uses of coastal resources are varied and often conflicting, and thus coastal-zone planning and management is necessary. Rational determination of public policy for the coastal zone must recognize factors relating to (a) physical, chemical, and biological characteristics, (b) urbanization and development, and (c) governmental capacity for adequate policies and programs. Inherent is the realization that neither complete exploitation nor preservation is appropriate or practicable. A balance must be maintained to maximize long-term as well as immediate benefits through appropriate management of coastal resources within the framework of water-resource systems. (Knapp-USGS)

PROBLEMS OF WATER RESOURCE DEVELOPMENT IN THE GULF COAST ESTUARINE ZONE,
Forest Service (USDA), New Orleans, La. Southern Forest Experiment Station.
L. C. Irland, and J. W. Tarver.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 738-753, (1972). 2 fig, 3 tab, 25 ref.

Descriptors: *Estuarine environment, *Mississippi River, *Gulf of Mexico, *Louisiana, *Water resources development, *Ecosystems, *Planning, Economics, Legal aspects, Hydrology, Deltas, Environmental engineering, Public rights, Governments, *Risks.
Identifiers: Human activities.

The Gulf Coast Estuarine Region, based upon the Delta of the Mississippi River, is one of the world's largest and most productive estuaries. Connected by water input from streams and the ebb and flow of tides, the region is an ecological unit. Human activities, including trade, manufacturing, and oil production, have altered natural flow patterns and reduced estuarine productivity. Purposeful coordinated planning is needed, but even if it were established, severe uncertainties would remain: (1) Uncertain knowledge, including ignorance of basic hydrologic and biological processes in the region, hindering evaluation of project effects on the estuarine system; (2) uncertain prediction, concerning primarily the difficulty of forecasting economic activity in the area, hindering evaluation of project benefits; and (3) uncertain control (legal) over resource users, complicating comprehensive planning. The resources of the Gulf Coast region, the current activities of man in the area, and their ecological impact are described. Also described are the uncertainties of economic prospects, legal relations that affect resource planning, and priority research needs; the implications of these uncertainties are considered. Possible adjustments to uncertainties are described, including research expansion, setting of safe minimum standards, and establishment of statewide land use control. BRIEF FIELD GUIDE TO INTERTIDAL SEDIMENTS, MINAS BASIN, NOVA SCOTIA,
McMaster Univ., Hamilton (Ontario). Dept. of Geology.
G. V. Middleton.
Maritime Sediments, Vol 8, No 3, p 114-122, December 1972. 4 fig, 35 ref.

Descriptors: *Sediments, *Tides, *Sediment transport, Canada, Currents (Water), Tidal waters, Tidal effects.
Identifiers: *Bay of Fundy, *Minas Basin.

The Bay of Fundy is famous for its tides which are reputed to have the greatest range of any in the world. The cause of the very large tidal range is resonant amplification of the semidiurnal tidal component. The resonant condition is critically dependent on the dimensions of the Bay, and these dimensions must have been achieved only during the last 4,000 years. Changes in sea level have considerably affected tidal amplitude. The main growth in tidal amplitude took place as the bay both widened and, on the average, shallowed with the main effect due to shallowing some 4,000 to 1,000 years ago. Much of the apparent rise in sea level may therefore be due to increasing tidal amplitude (and therefore rise in the higher high water level that is used as a sea level datum). However,

there is still an excess rate of subsidence of 7-9 cm/100 years. Depths in the Minas Passage reach 400 ft but are generally not more than 30 ft within the basin itself. Tidal velocities are extreme in the Minas Passage, reaching 11 knots, are generally 3 to 4 knots in the open basin, and decrease near the shore to a maximum of 1 to 3 knots over the main sand bodies. Much of the Minas Passage is underlain by bedrock, swept bare of sediment by the strong tidal currents. The general distribution of modern intertidal sediments in the Minas Basin-Cobequid Bay is reviewed. (Knapp-USGS)

A NOTE ON WIND AND WAVE CONDITIONS IN THE SOUTHERN GULF OF ST. LAWRENCE,
McMaster Univ., Hamilton (Ontario).
E. A. Bryant, and S. B. McCann.
Maritime Sediments, Vol 8, No 3, p 101-103, December 1972. 2 fig, 1 tab, 3 ref.

Descriptors: *Waves (Water), *Ocean waves, Beach erosion, Winds, Surf, Refraction (Water waves), Fetch.
Identifiers: *Gulf of St. Lawrence.

The Gulf of St. Lawrence is connected to the Atlantic via two narrow straits--the Strait of Belle Isle to the northwest and Cabot Strait to the east--but the important waves are generated within the Gulf rather than entering from the open ocean via these straits. Wave systems tend to be concentrated on particular stretches of coastline due to wave refraction in the southern part of the Gulf. The prevalent winds blow from between south and northwest, accounting for 58% of total wind directions but only 40% of maximum wind speeds for each month. The strongest winds come from between north and east-southeast. The significance of this pattern is that the prevalent winds are offshore on the open gulf sandy coasts of New Brunswick and Prince Edward Island, and that there are many periods when wave action is relatively light. However, the strongest winds, though less frequent, blow over long fetches generating the dominant waves, which are of low frequency but large magnitude. (Knapp-USGS)

ENVIRONMENTAL APPLICATION OF REMOTE SENSING METHODS TO COASTAL ZONE LAND USE AND MARINE RESOURCE MNAGEMENT,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
H. G. Goodell, C. M. Woolheater, and K. L. Echternacht.
Available from NTIS, Springfield, Va 22151 as PB-214 547 Price $3.00 printed copy; $1.45 microfiche. Geological Survey Interagency Report USGS-243, September 1972. 132 p, 24 fig, 33 tab, 28 ref. NASA W-13165, Task 160-75-01-32-10-, USGS 14-08-001-12540.

Descriptors: *Remote sensing, *Land management, *Land use, Environment, Coastal plains, Aerial photography, Mapping, Topography, Data collections, Erosion, Water pollution sources, Climatic data, Census, Soil environment, Water resources, Surface water, Groundwater, Reviews.
Identifiers: *Central Atlantic coastal zone, Marine resources management.

The potential of remote sensing both as a source of data and as the basis for an information system for resource analysis and management within the coastal zone is described. Criteria are presented for a computer based model for forecasting the environmental consequences of resource allocations involving land use decision. Its ultimate efficiency will depend on the accuracy of the algorithms which link land use to a specific environmental impact and on the identification of the synergistic effects of these impacts. Two major data sources are used: land use data as identified principally by remote sensing, and dynamic climatological data to be developed from the National Weather Records Center of NOAA. The demonstration project suggests the establishment of RICHEL, an environmental laboratory, wherein the impact algorithms initially used in forecasting could be verified by field data so that the precision of the algorithms could be refined. HEAVY MINERAL CONCENTRATING PROCESSES AND DENSITY/SHAPE/SIZE EQUILIBRIA IN THE MARINE AND COASTAL DUNE SANDS OF THE APALACHICOLA, FLORIDA, REGION,
Florida State Univ., Tallahassee. Dept. of Geology.
F. W. Stapor, Jr.
Journal of Sedimentary Petrology, Vol 43, No 2, p 396-407, June 1973. 4 fig, 5 tab, 16 ref.

Descriptors: *Mineralogy, *Sands, *Beaches, *Dunes, *Sediment transport, Sediment sorting, Specific gravity, Particle shape, Particle size, Winds, Surf, Littoral drift, *Florida, Gulf of Mexico.
Identifiers: *Heavy minerals, Apalachicola (Fla).

Two marine concentrating processes operate to produce the heavy mineral deposits found on beaches in the vicinity of Appalachicola, Florida. The process operating in the more energetic Gulf of Mexico tends to remove the coarser grains from initial populations. This results in a relatively fine-grained black sand concentrate being delivered to the beach for deposition. The reverse occurs in the less energetic bays and sounds; the process tends to remove the finer grains and the deposits are coarser. The quartz associated with both types of deposits is in equilibrium, but not settling equivalence, with ilmenite, staurolite, and kyanite. Settling equivalence is present among the ilmenite, staurolite, and kyanite populations of the sheltered beach deposits only. Zircon and rutile are too small in grain size to be in equilibrium with the other minerals; this probably reflects smaller variances of the initial populations. The dune deposits were concentrated by gentler-than-normal winds reworking beach sands containing areally limited heavy mineral deposits. Ilmenite, staurolite, kyanite, and quartz are in settling equivalence, the zircon and rutile are too small. Good evidence exists for a shape-based decrease in grain size for kyanite and rutile during wind transport. (Knapp-USGS)

HYDRAULIC SAND-MODEL STUDY OF THE CYCLIC FLOW OF SALT WATER IN A COASTAL AQUIFER,
Geological Survey, Phoenix, Ariz.
J. M. Cahill
Geological Survey Professional Paper 575-B, p B240-244, 1967. 4 fig, 5 ref.

Descriptors: *Saline water-freshwater interfaces, *Model studies, *Tracers, Tidal waters, Saline water intrusion, Hydraulic models.
Identifiers: *Coastal aquifers, *Zone of diffusion, Nonoscillatory motion, Oscillatory motion, Time-lapse photography.

Model studies demonstrate visually that 'cyclic flow' takes place in the denser fluid when fresh water seaward over intruding ocean water. When tidal fluctuations are simulated in the model by alternately raising and lowering the level of the free body of salt water, additional mixing of the two miscible fluids occurs and additional salt water is transported into the fresh-water region. The fluid movement was observed by following colored tracers that were injected into both fluids. These studies indicate that the degree of salt-water intrusion is controlled primarily by the flow of the fresh water rather than by tidal effects. (Campbell-NWWA)

3A. Saline Water Conversion

WATER FROM GEOTHERMAL RESOURCES,
California Univ., Berkeley. Sea Water Conversion Lab.
A. D. K. Laird.
In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 177-196, 1973. 5 fig, 3 tab, 11 ref.

Descriptors: *Desalination, *Geothermal studies, *Electric power, Thermal powerplants, Economics, Distillation, Water resources development, Energy, Water sources.
Identifiers: *Geothermal power.

Geothermal energy is a potentially clean source of large amounts of power. Water carries thermal energy from the reservoirs to the surface. In some cases, condensate from steam turbines may be available as freshwater supplies. Distillation is a means of using geothermal energy for making more freshwater available. Consequently, large-scale geothermal distallation is a component of several energy production schemes. (See also W73-13214) (Knapp-USGS)

APPARATUS FOR DISTILLATION OF FLUIDS,
T. R. Best, Jr.

U.S. Patent No. 3,741,879, 5 p, 7 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 911, No 4, p 1417, June 26, 1973.

Descriptors: *Patents, *Distillation, *Evaporation, *Condensation, *Desalination, Sea water, Saline water, Salt water, Separation techniques, Potable water, Equipment.

The evaporation and condensation unit comprises a vertical outer shell with horizontal partitions dividing the shell's interior into an upper vapor distribution region, and intermediate heat transfer region and a lower condensate collection region. Heat transfer tubes extend vertically through these regions. There is a sump near the bottom of the heat transfer region for containing liquid which flows down along the outer surfaces of the tubes. Fluids are subjected to distillation by causing vapors to pass vertically through the tubes while a cooler liquid film flows over the outside of the tubes. The vapors condense and give up heat to the liquid film causing a portion to vaporize. A vapor outlet is mounted in the shell to permit emission of the vapors. (Sinha-OEIS)
W73-13322

PROCESS AND SYSTEM FOR EXTRACTING SALTS, CONCENTRATED BRINE, AND/OR PURE WATER FROM SALINE WATER,
Hydro Chemical and Mineral Corp., New York. (assignee)
A. Osdor.
U.S. Patent No. 3,741,878, 11 p, 13 fig, 3 tab, 10 ref; Official Gazette of the United States Patent Office, Vol 911, No 4, p 1417, June 26, 1973.

Descriptors: *Patents, *Desalination, *Evaporation, *Condensation, Saline water, Brine, Salt water, *Water treatment, *Flash distillation, Heat transfer, Sea water, Potable water, Salts.

A system is described for flash distillation of a liquid mixture including saline water and an immiscible liquid having both a different density and a lower vapor pressure. The liquids are intimately mixed and continuously remixed during passage through each evaporator stage and U-tube connections so that heat transfer is maintained between the immiscible liquid and saline water droplets accompanying flashing. The liquids flow with turbulence and at a velocity to maintain the intimate mixing. A quanity of the solvent is vaporized while the immiscible liquid remains in the liquid state, thereby cooling the resultant mixture. The cooled immiscible liquid is separated from the cooled residual solution. The immiscible liquid is reheated by causing it to flow down by gravity through a series of condensers disposed at decreasing elevations as solvent evaporated from the solution is condensed. The condensers display increasing temperature and pressure conditions with decreasing elevation. The immiscible liquid is separated from the condensed solvent leaving the condenser. Pure water is vaporized until substantially all of the CaCO3 and most of the CaSO4 is precipitated with the remaining CaSO4 being in super-saturated solution. Precipitated salts settle out and the resultant mixture is fed into a settling tank where remaining salts settle out and the immiscible liquid is separated out. (Sinha-OEIS)
W73-13323

MULTI-STAGE FLASH DISTILLATION PROCESS,
A. R. Spicacci.
U.S. Patent No 3,734,835, 5 p, 6 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 910, No 4, p 1307, May 22, 1973.

Descriptors: *Patents, *Desalination, *Descaling, *Flash distillation, Separation techniques, *Water purification, Water quality, *Evaporators, *Heat exchangers, Treatment, Equipment.

Feed liquid, progressively preheated by passage along a primary flow path in heat exchange relation with vapor zones of successively staged flash evaporation chambers, is diverted from at least one region of the primary flow path directly into an associated flash liquid zone having a flash liquid temperature equal to the temperature of the feed liquid. Some of the streams are treated with scale inhibitor. Each stream is diverted from the primary flow path when the preheated liquid in the stream attains a temperature slightly below the temperature at which scale deposition tends to occur. (Sinha-OEIS)
W73-13336

3B. Water Yield Improvement

ENGINEERING HYDROLOGY,
Oregon State Univ., Corvallis. Water Resources Research Inst.
P. C. Kingeman.
Available from the National Technical Information Service as PB-222 608, $3.00 in paper copy, $1.45 in microfiche. Project completion report, June 1973. 36 p, 19 ref. OWRR A-001-ORE (19).

Descriptors: Hydrology, *Water yield, *Water shed management, Measurements, *Sediment transport, *Gravels, Spawning, *Oregon, *Silts, *Forecasting, Anadromous fish.

Results are summarized of a six-year study dealing with the engineering aspects of the hydrology of water yield prediction and related problems. The study emphasized (a) the identification of critical problem areas for hydrologic research in Oregon, (b) the planning, development, and coordination of interdisciplinary research and education in hydrology, (c) investigation of the influence of landform and precipitation parameters on the water yield from watersheds, (d) prediction of water yield from watersheds in the Oregon Coast Range, (e) sediment transport in coarse-bedded streams, (f) artificial development of gravel streambeds to provide spawning areas for anadromous fish, and (g) control of siltation in artificially developed spawning channels.

PRODUCTIVITY OF TALL WHEATGRASS AND GREAT BASIN WILDRYE UNDER IRRIGATION ON A GREASEWOOD-RABBITBRUSH RANGE SITE,
Agricultural Research Service, Reno, Nev. Plant Science Research Div.
R. E. Eckert, Jr., A. D. Bruner, and G. J. Klomp.
Journal of Range Management, Vol 26, No 4, p 286-288, July 1973. 2 tab, 7 ref.

Descriptors: *Phreatophytes, *Forage grasses, *Wheatgrass, *Productivity, *Nevada, Rabbitbrush, Ranges, Crop production, Crop response, Planting management, Seeds, Spring, *Sprinkler irrigation, Irrigation practices, Longevity, Soil chemical properties, Soil physical properties, Root development, Root distribution, Plant growth, Saline soils, Sodic soils.
Identifiers: *Humboldt River Basin (Nev), Greasewood (Sarcobatus vermiculatus), Wild rye grass, Sodic soils.

In the Humboldt River Basin of northern Nevada, the replacement of some 394,000 acres of greasewood and rubber rabbitbrush with forage plants of high economic value would salvage a large portion of the 103,000 acre feet of water estimated to be used yearly by those non-beneficial phreatophytes. In this study tall wheatgrass and Great Basin wildrye were springseeded on the range site and established by sprinkler irrigation. An evaluation of the longevity and productivity of these seeded species under different irrigation regimes was made and showed that weekly irrigations for 2-3 years were required to establish potentially productive stands of the seeded species. The highest production of tall wheatgrass and Great Basin wildrye was obtained 3 years after seeding with weekly irrigations of 1.25 inches of water, the wheatgrass being the more productive. Productivity with limited water or without water was reduced by the chemical properties of the saline-sodic soil, while root growth was restricted by the physical characteristics of the soil. (Gloyd-Arizona)
W73-13314

3C. Use of Water of Impaired Quality

SALINITY AND DRAINAGE IN A BROWN CHERNOZEM IRRIGATED AT DIFFERENT MINIMUM MOISTURE CONTENTS,
Department of Agriculture, Lethbridge (Alberta). Research Station.
K. K. Krogman, and E. H. Hobbs.
Can J Soil Sci. Vol 52, No 3, p 359-364. 1972. Illus.
Identifiers: *Brown chernozem, Crop yields, *Drainage, Evapo-transpiration, Irrigation, Moisture, *Salinity, Transpiration.

The salinity of a brown chernozem under 4 irrigation regimes was measured at the beginning and end of each of 2 cycles of a 4-yr crop rotation. Irrigation reduced soil salinity during the first cycle and maintained it at the reduced level during the second cycle. Drainage in 4 yr, calculated on the basis of salt balances, increased proportionately to irrigation plus rainfall. Where only enough water was applied to maximize crop yields, that is, where soil moisture was maintained within the upper half of the available range, about 95% of the irrigation plus rainfall was utilized by the crops through evapotranspiration. Under this regime, maximum crop yields and an adequately low level of soil salinity were maintained.--Copyright 1973, Biological Abstracts, Inc.
W73-13109

STUDIES ON SODIUM WATER FOR IRRIGATION. EFFECT OF ADDITION OF CATIONS: K, CA OR MG,
Punjab Agricultural Univ., Ludhiana (India). Dept. of Soils.
B. K. Sinha, and G. Dev.
J Res Punjab Agric Univ. Vol 9, No 1, p 40-49. 1972.
Identifiers: *Berseem, Calcium, Cations, Growth, Irrigation, Magnesium, Potassium, *Sodium water, Crop yield.

A greenhouse experiment was conducted on a loamy-sand soil to study the effect of irrigation water, containing 2 concentrations of Na, on berseem, as influenced by the presence of K, Ca or Mg. The use of Na water (12.8 me/l Na) drastically reduced the yield of berseem by affecting plant survival and growth, and resulted in an increased concentration of Na in the plants; the K content in plants decreased and the quality of the produce in terms of N content also deteriorated. The addition of K or Ca tended to offset the damaging effects of Na, both for the yield and the content of N in berseem. This effect of cations was evident at a lower concentration of Na in water (12.8 me/l).--Copyright 1973, Biological Abstracts, Inc.

PLANT INDUCED SOIL SALINITY PATTERNS IN TWO SALTBUSH (ATRIPLEX SPP.) COMMUNITIES,
Commonwealth Scientific and Industrial Research Organization, Deniliquin (Australia). Rivernina Lab.
M. L. Sharma, and D. J. Tongway.
Journal of Range Management, Vol 26, No 2, p 121-125, March 1973. 3 fig, 5 tab, 9 ref.

Descriptors: *Saline soils, *Plant growth, *Salt tolerance, *Soil-water-plant relationships, On-site investigations, Soil surveys, Decomposing organic matter, Leaching, Precipitation (Atmospheric), Evaporation, Water utilization, Saltation, Semiarid climates.
Identifiers: *Saltbush.

Atriplex vesicaria and A. nummularia were examined on two soil types. Both saltbush species induced significantly higher salinity in the 0-15 cm soil horizon beneath the bush canopies compared to between the bushes. Salinity level on only surface layers (0-7.5 to 15 cm) fluctuated with season; the salinity was highest during and after summer when the evaporative demands were high, and lowest during winter after rains. The contribution of salinity from the water table was examined and discounted as a highly doubtful source. It is hypothesized that salt accumulation, depletion, and compensation are a net result of processes which accumulate salts at one position and those which deplete them from the other. These processes include plant litter fall and its decomposition; leaching of salts from plants with rain, along with leaching in the soil profile; evaporation of water from soil surface and deposition of salts at the soil surface; water movement to plant roots and convectional transport of salts, including salt transport by ionic diffusion. METHODOLOGY FOR ASSESSMENT OF URBAN WATER PLANNING OBJECTIVES,
Texas A and M Univ., College Station. Water Resources Inst.
W. L. Meier, and B. M. Thornton.
Technical Report No 51, June 1973, 158 p, 33 fig, 6 tab, 98 ref.

Descriptors: Planning, *City planning, *Decision making, *Alternative planning, *Texas, *Urbanization, Water management (Applied), Water demand, Water utilization, Water quality standards, Local governments.
Identifiers: *San Antonio River (Tex), Objective setting procedure, *Planning procedures.

One of the most perplexing problems in the United States is concerned with providing the public services required in rapidly-expanding urban areas. This problem involves the development, use, and management of water resources. In order to allocate the available physical and economic resources, water resource planners have concentrated on developing planning techniques to meet these allocation problems. Significant gains have been made by the application of systems analysis and operations reasearch, but little attention has been directed in the past towards the development of procedures for the formulation of objectives in water resource planning. This research is concerned with the study of urban water planning objectives in the San Antonio, Texas area. Specific goals were set and researched. Then, the procedure was applied to a realistic problem encountered by the San Antonio, Texas metropolitan area. The study indicates how other such procedures can be generated, depending on the planning environment and the problems at hand. The major conclusions are (1) urban water planning will continue to be a complicated, yet indispensible, process for urban water management; (2) the objective setting is an important phase of the planning process, (3) there is a need for a stated procedure on how to assess urban water planning objectives, and (4) the procedure can be applicable to any area concerned with water planning objectives by water resource planning agencies. CHARACTERISTICS OF GEOTHERMAL RESOURCES,
Geological Survey, Menlo Park, Calif.
D. E. White.
In: Geothermal Energy--Resources, Production Stimulation; Proceedings of Special Symposium o

American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 69-94, 1973. 4 fig, 1 tab, 50 ref.

Descriptors: *Geothermal studies, *Electric power, *Electric power demand, *Thermal powerplants, Electric power production, Hydrogeology, Water resources development, Energy, Steam turbines, Wells.
Identifiers: *Geothermal power, *Power demand.

The major known geothermal systems of the world and the existing capacity of the major producing fields are summarized. Hydrothermal--convention systems, whether dominated by vapor or by hot water, are generally associated with tectonic plate boundaries and volcanic activity. In hydrothermal-convention systems most heat is transferred in circulating fluids rather than by conduction. Hot water systems are characterized by liquid water as the continuous, pressure-controlling fluid phase. A few geothermal systems, including the important Larderello fields of Italy and The Geysers of California, produce dry or superheated steam with no associated liquid. Liquid water and vapor normally coexist in the reservoirs with vapor as the continuous, pressure-controlling phase. One or more of several potentially important breakthroughs in technology may greatly expand the development of dry and low-temperature geothermal systems. Heat-exchange technology would permit utilizing the heat from fluids down to 100 deg C or less. Multipurpose developments, including desalination and chemical recovery, would yield significant sharing of total costs. Low cost mechanical, chemical, or nuclear fracturing of hot, dry rocks would increase permeability, thus permitting introduction of fluids and recovery of stored energy. In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 95-128, 1973. 15 fig, 81 ref.

Descriptors: *Geothermal studies, *Electric power, *Electric power demand, *Thermal powerplants, *Exploration, Subsurface investigations, Electric power production, Hydrogeology, Water resources development, Energy, Steam turbines, Wells.
Identifiers: *Geothermal power, *Power demand.

The methods available for the exploration, discovery, and delineation of economic reservoirs of geothermal energy are reviewed. The objectives of geothermal exploration ventures are to locate areas underlain by hot rock, to estimate the volume, temperature, and permeability at depth, to predict whether wells will produce dry steam or a mixture of water and steam, and to predict the chemical composition of the produced fluid. The following steps, or phases, each successively more sophisticated and/or expensive are suggested: literature search, airborne survey, geologic and hydrologic survey, geochemical survey, geophysical survey, and drilling. STEAM PRODUCTION AT THE GEYSERS GEOTHERMAL FIELD,
Union Oil Co. of California, Cloverdale. Big Geysers Station.
C. F. Budd, Jr.
In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 129-144, 1973. 7 fig, 5 ref.

Descriptors: *Geothermal studies, *Electric power, *Electric power demand, *Thermal powerplants, Electric power production, Hydrogeology, Water resources development, Energy, Steam turbines, Wells, *California.
Identifiers: *Geothermal power, *Power demand, *Geysers geothermal field (Calif).

At the Geysers in northern Sonoma County, California, the dominant phase of water is gaseous steam, a condition existing in only a few major commercially producing fields in the world, including the Larderello field in Italy and the Matsukawa field in Japan. A constant rate of production cannot be sustained. Individual wells have declined in production, and additional wells have been required to maintain the supply of steam to the generating units. This has been the experience at the Larderello field as well, where continued drilling is required to maintain a constant generating capacity of 365 Mw. Pressure depletion in the reservoir is a factor in the production decline, and field-wide static reservoir-pressure surveys have confirmed this suggestion. A typical wellhead and pipeline configuration with the blowdown tee, centrifugal separator, meter run, and dirt-leg is shown. The utility's powerplant liquid effluent constitutes about 25% of the total condensed steam throughout, the remainder being evaporated in the cooling towers. This effluent contains most of the water-soluble constituents of the steam and cannot be discharged into surface waters which are drawn upon for domestic and agricultural use. It is therefore reinjected into the steam formation through injection wells. (See also W73-13214) (Knapp-USGS)

GEOTHERMAL POWER STILL IFFY,
G. Weismantel.
Chemical Engineering, Vol 80, No 6, p 40-41, March 5, 1973. 2 fig.

Descriptors: *Thermal power plants, *Geothermal studies, *Brines, *Steam, *Design, Efficiencies, Electric power production, Geology, Heat flow, Temperature, Brine disposal, Drilling, Trace elements, Costs, Environmental effects, Evaluation, Performance.
Identifiers: *Mexico (Cerro Prieto), Magmamax process.

Interest in the possibility of geothermal-based power units has grown in the face of the U.S.'s rising fuel and power shortage. During 1972, electricity has flowed from geothermal power units in Cerro Prieto, Mexico; the Magmamax process of Magma Power Company has found a sponsor; and a test facility for electricity and pure water production has been developed by Envirogenics Company. These three systems tap into earth-locked hot brine which is about 500 F, to flash off steam to run turbines. The cycle efficiency of the Cerro Prieto facility is about 10-15%, but is expected to grow to about 30% with more diversified use of the geothermal energy. Envirogenics believes 22-30% efficiency can be achieved with its dual purpose process. The corrosive properties of brine increase equipment costs and the presence of trace materials threatens the biological community in recipient streams. Some problems may be by-passed with the development of a helical screw expander which is now being tested. The cost of electricity of the Cerro Prieto facility is $350/kw not including brine disposal and air pollution control. This may not be low enough to compete with nuclear or oil fire generators. PREOPERATIONAL CLEANING OF HIGH PRESSURE STEAM SYSTEMS,
Black and Veatch, Kansas City, Mo.
T. C. Hoppe, and J. G. Parmley.
Industrial Water Engineering, p. 25-28, March/April 1973.

Descriptors: *Steam, *Industrial plants, *Operation and maintenance, *Cleaning, Thermal water, Electric power production, Facilities, Equipment, Maintenance, Installation, Maintenance costs, Reliability, Specifications, Methodology, Testing procedures, Storage requirements, Abrasive blasting, Detergents.
Identifiers: Pre-operation treatment.

The preoperation cleaning of steam systems is necessary to insure efficient operation and maintenance of the system. During construction and tests steps should be taken to prevent corrosion or visible gross material inadvertently remaining in the system after erection. Cycle components should be shop-coated with corrosion inhibitors and in hydrostatic testing only treated demineralized water should be used. The three basic steps in preoperational cleaning consist of : (1) water flushing to physically remove dirt and siliceous materials; (2) hot alkaline detergent washing to remove oils and grease; (3) hot acid cleaning to solubilize mill scale and remove residual silica from surfaces that have not been pre-blasted. The major consequences of improper preoperational quality control are discussed. These include oil build-up, tube failure due to improper storage, and poor feed water quality due to improper flushing. It is suggested that pre-boiler systems be acid-cleaned following the hot detergent wash, and although the initial cost of alkaline detergent cleaning is high it is economical in the long run. TEMPERATURE PROFILES IN CONDENSERS,
Oklahoma State Univ., Stillwater.
K. J. Bell.
Chemical Engineering Progress, Vol 68, No 7, p. 81-82, July 1972. 1 fig.

Descriptors: *Condensers, *Steam, *Temperature, *Cooling, Water quality control, Water cooling, Equipment, Heat exchangers, Condensation, Boilers, Mathematical models, Model studies, Profiles.

Some configurations of process condensers with integral desuperheating and/or subcooling are examined and analyzed. To determine whether or not condensation will occur on a cold surface exposed to superheated vapor it should be assumed that heat is transferred from the superheated vapor by sensible heat transfer. An equation for this situation is presented in which it is seen that if the temperature on the vapor side is greater than the condensing or saturation temperature, condensation will occur. The limited available information indicates that the heat transfer coefficient for condensation directly from superheated vapor is within a few percent of that for condensation from saturated vapor. It is simpler to assume that condensation will occur directly from the superheated vapor, using the saturation temperature and a condensing heat transfer coefficient in the rate equation, and including the sensible heat in the heat load. Where moderate subcooling is required, it may be desirable to provide a region in the shell where condensate may exchange heat with the coolant entering. (Jerome-Vanderbilt)

EFFECT OF NONCONDENSABLES IN SEA WATER EVAPORATORS,
Burns and Roe Construction Corp., Chula Vista, Calif.
R. A. Khan.
Chemical Engineering Progress, Vol 68, No 7, p 79-80, July 1972. 1 fig.

Descriptors: *Condensers, *Sea water, *Evaporators, *Heat transfer, Evaporation control, Design, Model studies, Water cooling, Experimental models, Mathematical models, Evaluation, Transmissivity.
Identifiers: *Noncondensables.

The presence of noncondensables in vapor condensers reduces heat transfer and causes gas binding. To remove non-condensables, a vent stream is withdrawn at the last tube row in the bundle. A vertical tube evaporator was built to obtain the minimum amount of vent stream. Results indicate that the vent rate is important in maintaining the bundle heat transfer coefficient at low noncondensable levels. The minimum vent rate is much higher than the amount of noncondensable present because a minimum vapor velocity is necessary for effective sweeping of the noncondensable through the tube bundle. Tests at high noncondensable loading indicate the vent rate is important in maintaining bundle heat transfer coefficients. Tests do not indicate any gross noncondensable stratification in the vertical shell. An empirical model for the loss of heat transfer coefficient due to noncondensable film resistance can be used as a rough guide for predicting the local bundle coefficients. (Jerome - Vanderbilt)

WATER REQUIREMENTS OF THE PETROLEUM REFINING INDUSTRY,
Maryland Univ., College Park.
L. E. Otts, Jr.
Geological Survey Water Supply Paper 1330-G, p 287-340, 1963.

Descriptors: *Water supply, Cooling, *Industrial water, Surveys, *Water requirements, Chemical reactions, Polymers, Planning.
Identifiers: *Petroleum industry, Cracking (Petroleum), Refineries, *Recirculation.

About 3,500 million gallons of water was withdrawn daily in 1955 for use by petroleum refineries in the United States. This was about 3 percent of the estimated daily withdrawal of industrial water in the United States in 1955. Ninety-one percent of the water requirements of the petroleum refineries surveyed was for cooling. One-third of the refineries reused their cooling water from 10 to more than 50 times. Only 17 refineries used once-through cooling systems. Refineries with recirculating cooling systems circulated about twice as much cooling water but needed about 25 times less makeup; however, they consumed about 24 times more water per barrel of charge than refineries using once-through cooling systems. The average noncracking refinery used about 375 gallons of water per barrel of crude, which is less than the 471-gallon average of refineries with cracking facilities. Refinery-owned sources of water supplied 95 percent of the makeup-water requirements. Surface-water sources provided 86 percent of the makeup-water demand. Less than 1 percent of the makeup water was obtained from reprocessed municipal sewage. (Campbell-NWWA)

HIGH-LIFT PUMPING AND THE IMPACT UPON ECONOMIC DEVELOPMENT OF DESERT LAND IN IDAHO,
Idaho Univ., Moscow. Dept. of Agriculture.
K. H. Lindeborg.
Idaho University Water Resources Research Institute Research Project Technical Completion Report, December 1970. 8 p, 1 fig, 1 tab, 3 ref. OWRR-A-002-IDA (1).

Descriptors: Water resources development, *Land development, *Irrigation, *Deserts, *Idaho, Imported water, Agriculture, Costs, Economics, Model studies, Evaluation.
Identifiers: *Nampa (Idaho).

This study was conducted in the Dry Lake area at Nampa, Idaho, where companies are pumping irrigation water from the Snake River to a plateau 500 to 600 feet above the river surface. Data was secured for 8 farms by interviewing each farm operator and land owner. To make comparisons between farms and also between enterprises, the data were broken down into per acre variable costs, fixed costs, total returns, net income, and the cost of producing a dollar's worth of output. The budgeting method of esumating water values in irrigation was used. Long-run planning cost curves were estimated from the budgets by using curvilinear regression. From the regression equations for each of the four enterprises (grain, sugar beets, potatoes, and alfalfa seed), 12 model farms were constructed. The long-run average total cost curve for the model farms, which incorporates a long-run rotation and long-run price and yield expectations, indicated economies of farm size of up to 2,400 acres. Net income, the measurement of how much money is left over to pay for irrigation water after all expenses (including remuneration for management, land, and investment) have been paid, varied from about $50.00 to $57.00 per acre for all model farms. (Woodard-USGS)

WATER AND LAND RESOURCES IN EDEN VALLEY, WYOMING,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
T. L. Hall, and J. H. Taylor.
Completion Report, February 1973. 180 p, 26 fig, 83 tab, 16 ref, 3 append. OWRR B-043-COLO (10).

Descriptors: *Water resources, *Land resources, *Land use, *Hydrologic budget, *Wyoming, Irrigation, Crops, Phreatophytes, Evapotranspiration, Water balance, Water quality, Water management (Applied), Consumptive use, Groundwater, Hydrogeology, Aquifer characteristics, Surface waters.
Identifiers: *Eden Valley (Wyo).

An inventory of existing information on land and water resources was made for Eden Valley, Wyoming. Much of the data came from existing reports of the United States Bureau of Reclamation. Some data were obtained from the University of Wyoming on irrigation efficiency studies conducted in Eden Valley. Land use data were concerned with the crops and phreatophytes in the valley in order that the consumptive use requirement could be computed. Being able to compute evapotranspiration allowed water budgets to be prepared for the 1963-1969 water years. A summary of mean monthly and mean annual water budget is reported. (Woodard-USGS)

RICE SEEDLINGS GERMINATED IN WATER WITH NORMAL AND IMPEDED ENVIRONMENTAL GAS EXCHANGE,
Birmingham Univ. (England). Dept. of Botany.
H. A. Kordan.
J Appl Ecol. Vol 9, No 2, p 527-533, 1972. Illus.

Identifiers: Environmental studies, Gas exchange, *Rice seedlings, Water-atmosphere interfaces, *Germination (Rice).

Marked differences in growth and developmental phenomena became evident in rice seedlings germinated in water when the normal gas exchange between the water and the atmosphere above was impeded. Normal growth and development of the seedlings were suspended during prolonged exposure of the plants to the aqueous medium where the normal environmental gas exchange was hindered. Provided that the seedlings were not severely damaged by microbial activity, normal growth and development of the plants were resumed when the normal gas exchange between the aquatic environment and the atmosphere above was restored.--Copyright 1973, Biological Abstracts, Inc.
W73-13092

COMPEITTION BETWEEN GRASS AND CLOVER FOR PHOSPHATE: II. EFFECT OF ROOT ACTIVITY, EFFICIENCY OF RESPONSE TO PHOSPHATE, AND SOIL MOISTURE,
Department of Scientific and Industrial Research, Palmerston North (New Zealand). Grassland Div.
R. H. Jackman, and M. C. H. Mouat.
N Z J Agric Res. Vol 15, No 4, p 667-675, 1972. Illus.
Identifiers: Agrostis-Tenuis, *Clover, *Grass, *Phosphates, *Root systems, Soil moisture, Trifolium-Repens.

Factors studied were the relative root activities for P uptake by white clover (Trifolium repens L.) and browntop (Agrostis tenuis Sibth) at different depths in the soil, the root tip numbers per unit volume of soil, the loss of soil moisture caused by the presence of browntop, and the response curves of white clover and browntop to applied P. Grass and clover roots can directly compete for P in the top 2.5 cm of top dressed soil, the grass can decrease the availability of P by increasing soil moisture tension, and both these results will affect white clover more adversely than browntop, because of the markedly less efficient response to applied P of clover than of browntop. This result will be most strongly expressed in soils which strongly fix P and easily develop high moisture tension.--Copyright 1973, Biological Abstracts, Inc.

INFLUENCE OF SURFACE SOIL CONDITIONS ON DRYING IN EARLY SPRING,
Macdonald Coll., Montreal (Quebec). Dept. of Soil Science.
M. M. Iqbal, and B. P. Warkentin.
Can J Soil Sci. Vol 52, No 3, p 449-456, 1972.
Identifiers: Bulk, Density, *Drying, *Hydraulic conductivity, *Soils (Plowed and unplowed), Spring.

Changes in water content of adjacent plowed and unplowed surface soils were measured in early spring in the field. The plowed plots on sand and clay soils lost more water than unplowed plots. The major decrease in water content of the clay soil was in the 0-7-cm layer, whereas the sand lost as much water from the 7-15-cm layer as from the 0-7-cm layer. The medium-grained soil showed greater drying from the unplowed than from the plowed surface. The higher bulk density of this soil may account for this observation. Differences in net radiation measured above plowed and unplowed surfaces were too small to account for the measured differences in water loss. There was evidence that the drier surface was due to lower hydraulic conductivity of the plowed surface, but increased turbulent transfer from the rougher surface could also be involved.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF WATER REGIME ON THE SUCROSE-ENZYME RELATIONSHIPS OF SUGARCANE DESSICATED WITH PARAQUAT,
Puerto Rico Univ., Mayaguez. Agricultural Experiment Station.
R. Montalvo-Zapata, and A. G. Alexander.
J Agric Univ P R. Vol 56, No 2, p 134-153. Illus. 1972.
Identifiers: Enzymes, Herbicides, *Paraquat, *Sucrose-enzyme relations, *Sugarcane, Water regime.

Immature sugarcane was given variable-water regimes in sand culture and subsequently treated with a powerful desiccant, the bipyridylium herbicide Paraquat, applied as a 0.05 percent aqueous foliar spray. The objectives were to evaluate the effects of water regime on sucrose-enzyme relationships in desiccating sugarcane, and to determine whether controlled water regimes could effectively modify Paraquat activity in sugarcane. Tissue samples were harvested for moisture, sugar and enzyme analyses at 1, 3 and 9 days after Paraquat application. Low water supply (1 liter/day) reduced total fresh weights and stalk weights, and increased sucrose content of immature storage tissue. Paraquat significantly lowered total fresh weights, stalk weights, sheath moisture and leaf sucrose by the 9-day harvest. Desiccant action was generally more rapid within the low-water regime. High- and intermediate-water regimes tended to modify Paraquat activity at 1 or 3 days, but its ultimate effects were comparable regardless of water regime. No evidence was found to support the theory that deisccating cane accumulates water as a function of continued water absorption when transpiration has ceased. Acid invertase was suppressed by Paraquat. The suppression was most severe in the low-water regime. Low-water supply significantly lowered invertase level but the response was not consistent at all harvests. Acid phosphatase and ATPase were severely repressed by Paraquat in leaves but not in immature storage tissue. An explanation was offered in terms of distinct chloroplast and mitochondrial enzymes rather than localized Paraquat action. For both enzymes the desiccant repression was significantly more severe in the high-water regime at 1 or 3 days, but water regime showed no effect at 9 days. Paraquat significantly increased beta-amylase in leaves particularly within the high-water regime. In immature stem tissue beta-amylase was repressed by high water in Paraquat-free plants. Paraquat eliminated the water effect. Peroxidase was increased in storage tissue by Paraquat. This response was statistically significant only under conditions of low-water supply. Variable water regimes can modify the rate of initial Paraquat activity in sugarcane; however, the ultimate effects of Paraquat will not be changed under conditions of thorough chemical application. Under field conditions of marginal chemical penetration, the plant's moisture status might play a more decisive role in determining the desiccant's effectiveness.--Copyright 1973, Biological Abstracts, Inc.

WATER LOSS FROM CUT GRASS WITH SPECIAL REFERENCE TO HAY-MAKING,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel).
Y. Leshem, R. Thaine, C. E. Harris, and R. J. Canaway.
Ann Appl Biol. Vol 72, No 1, p 89-104. 1972. Illus.
Identifiers: Air, Drying, *Grass, *Hay, Humidity, Petroleum vapor, Temperature, Tissue, Treatments, Vapor pressure, *Water loss.

An apparatus, used to measure water loss at 28 plus or minus 1C from blotting paper and from leaves and stem internodes of cocksfoot, consisted of 4 channels in which air speed was controlled at 25-80 cm/s and relative humidity at 7-68%. The maximum rate of water loss from wet blotting paper was 10,500 mg water/dm/hr but from leaves and stem internodes supplied with water it was less than 250 mg/dm/hr. The rate of loss from both plant specimens and blotting paper was linearly related to the vapor pressure differences between the specimen and the surrounding air but was not increased when air speed was changed from 40 to 80 cm/s. Grass specimens supplied with water had lower rates of water loss than wet blotting paper because of tissue resistances which were calculated for (a) untreated leaf and stem specimens, (b) rubbed leaves, (c) cut leaves, (d) leaves exposed to steam for 60 s. Treatments (b)- (d) greatly reduced tissue resistances. The rates of drying of leaves and stem internodes not supplied with water changed only slightly in response to faster air speeds but were significantly increased by treatments (b), (c), (c sub) (split stems), (d) and (e) (exposure to petroleum vapor for 60 S). The most effective treatments trebled the drying rates of leaves and increased the drying rates of stem internodes by 10 times. Reductions in relative humidity had little effect on drying rate following treatments (a), (b), (c) and (d), but when treatments (c sub) and (3) were given, additional significant increases in drying rates were obtained when the relative humidity was reduced. Grass specimens given the most effective treatments and dried under the most favorable conditions did not utilize the full drying capacity of the environment, for the rates of water loss from these specimens were at least 3 times lower than those from wet blotting paper. High rates of drying could apparently be achieved at 28C or similar temperatures if practical treatments were developed to remove or greatly reduce the high resistance to water loss in cut grass.--Copyright 1973, Biological Abstracts, Inc.

ECONOMIC SIGNIFICANCE OF DRY-LAND FARMING IN THE ARID NORTHERN NEGEV OF ISRAEL,
Israel Meteorological Service, Bet-Dagan. Div. of Agricultural Meteorology.
J. Lomas.
Agric. Meteorol. Vol 10, No 4/5, p 383-392. 1972. Illus.
Identifiers: Arid lands, *Dry-land farming, Economic farming, Irrigation, *Israel (Negev Desert), Rainfall, Wheat yield relationships, Statistical studies, *Wheat yield.

Under arid conditions rainfall-wheat yield relationships analyzed by means of simple and multiple regressions principal components and Fisher's orthogonal polynomial method all gave good results. Fisher's technique was then employed to estimate the effect on final yield of a unit change in rainfall. The response curve obtained was used to calculate wheat yields for a cross-section of the northern Negrev, where mean annual rainfall varies from 200-411 mm. A 20% profit margin can probably be obtained in 7 of every 10 yr only in an area where the mean annual rainfall is at least 300mm. Where rainfall is below 300 mm additional

irrigation is essential, for in an area of 240 mm 20% profit margins can only be obtained 3-4 times in every 10 yr. Under local climatic and soil conditions and agrotechnical practices the highest average yield response to irrigation is obtained during the first 40 days after planting.--Copyright 1973, Biological Abstracts, Inc.

INHERITANCE AND PHYSIOLOGICAL EFFECTS OF STOMATAL FREQUENCY IN BARLEY,
Funk Bros. Seed Co., Bloomington, Ill. Winter Wheat Research.
K. E. Miskin, D. C. Rasmusson, and D. N. Moss.
Crop Sci. Vol 12, No 6, p 780-783. 1972. Illus.
Identifiers: *Barley, Droughts, Hordeum-Vulgare, Inheritance, *Photosynthesis, Physiological effects, *Stomatal frequency, *Transpiration.

The inheritance of stomatal frequency in 5 barley (Hordeum vulgare L.), populations and the effect of stomatal frequency on photosynthesis, transpiration, and stomatal resistance to diffusion were studied. Barley lines high and low in stomatal frequency from 2 backcross populations were used. Heritabilities, estimated by the parent-progeny regression method, ranged from 22 to 74%. These estimates were for the F2 and F3 generations on the individual plant basis. Realized heritabilities based on simulated high and low selection were in good agreement with the regression estimates, although the estimates were consistently higher for the high than for the low selection. For plants pretreated to assure open stomata, stomatal diffusive resistances and transpiration rates differed statistically among lines, but photosynthesis did not. Lines having low stomatal frequencies had higher stomatal resistances, and transpired less water than lines with more stomata. A 25% decrease in frequency of stomata reduced transpiration rates by about 24%. Stomatal frequency did not influence the rate of photosynthesis, however. The possibility exists of altering transpiration without altering photosynthesis by selecting varieties with fewer stomata.--Copyright 1973, Biological Abstracts, Inc.

CLIMATIC UNCERTAINTY EFFECTS ON MANAGEMENT AND DESIGN OF RESERVOIR-IRRIGATION SYSTEMS,
Montana State Univ., Bozeman. Dept. of Economics and Agricultural Economics.
N. J. Dudley.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 508-517, (1972). 1 fig, 8 ref.

Descriptors: *Reservoirs, *Irrigation projects, *Design, *Management, *Simulation analysis, *Dynamic programming, *Model studies, Optimization crops, Reliability, Water supply, Systems analysis, *Risks.
Identifiers: *Climatic uncertainty.

Before determining optimal levels of design variables for proposed water resource systems, one must optimize operational management for different design-variable combinations. In irrigation systems especially, such optimization is complicated by climatic uncertainty. Traditional project evaluation procedures use deterministic crop water requirements and the objective of a high level of reliability of water supply to farmers. Each of these may lead to sub-optimal designs in climatically-variable environments. Models developed to incorporate variable crop water use and obtain measures of expected net revenue-net revenue variance tradeoffs to aid in selecting optimal reliability levels are briefly reviewed. In the proposed project examined, both the expected value and variance of net revenue are very sensitive to changes in the reliability level. (See also W73-13134) (Bell-Cornell)

ESTIMATING BENEFITS TO IMPROVED SEASONAL WATER SUPPLY FORECASTS: A CASE STUDY OF IRRIGATION BENEFITS,
Battelle Memorial Inst., Columbus, Ohio.
J. L. Moore.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 610-628, (1972). 1 fig, 5 tab, 14 ref.

Descriptors: *Estimating, *Benefits, *Seasonal, *Water supply, *Forecasting, *Irrigation, *Linear programming, *Streamflow, Crops, Probability, Harvesting, Optimization, Acreage, Mathematical models, Systems analysis.
Identifiers: Error, Bayes' formula.

The approximate benefits to a typical irrigation area from improved seasonal streamflow forecasts are quantified using a probabilistic linear programming model. In this formulation, a two-period analysis is represented in which planting crops takes place on the basis of probabilistic predictions of the water supply necessary for growing and harvesting crops. The decision variable of interest is the change in acreages planted that may take place as the dispersion of forecast error is reduced. Seasonal streamflow forecasts give rise in theory to conditional probability distributions of observing various quantities of seasonal water supply. Hypothetical conditional probabilities are computed using Bayes' formula. Increase in accuracy is measured by using calculations of the conditional entropy of the probability distributions derived from the Bayes formulation. The model serves to allocate a region's crop acreages so as to maximize the expected income of planting associated with each forecast. Output includes expected income for each forecast and crop acreages planted based on each forecast. Results from testing the model indicate gross benefits ranging from a few cents per acre up to as much as $6.00 per acre. The results exhibit diminishing returns to successive increments of increased forecast accuracy. (See also W73-13141) (Bell-Cornell)

DRY FARMING: UNCERTAINTY IN LAND AND WATER PRODUCTIVITY,
Arizona Univ., Tucson.
O. Benassini, J. F. Bueno, and H. K. Qashu.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 884-902, (1972). 6 fig, 1 tab.

Descriptors: *Dry farming, *Land, *Productivity, Agriculture, Crops, Precipitation (Atmospheric), Probability, Resources development, Management, Technology, Irrigation, *Risks.
Identifiers: Gains, Penalties, Space-time distribution.

Productivity of land, water and human resources is a function of different interactive processes of varying complexity. Resource development and management planning implies knowledge of the system behavior and its production capacity. Three sets of production levels are recognized: (1) Current production levels under present practices; (2) potential production capacity through optimal use of present technology and small investments; and (3) potential production capacity through larger investments and development of water resources. A comprehensive system for comparing gains and penalties generated from additional and/or improved practices to increase productivity is presented. The proposed system recognized space-time distribution of rainfall, soil-crop allocation, crop ecology, and supplemental irrigation demands. (See also W73-13134) (Bell-Cornell)

A COMPARATIVE STUDY OF SOIL VERSUS FOLLAR APPLICATION OF AMMONIUM NITRATE TO WHEAT UNDER DIFFERENT MOISTURE REGIMES,
Newe Yaar Experiment Station (Israel). Div. of Forage Crops and Pasture.
H. Nerson, and Z. Karchi.
Israel Journal of Agricultural Research, Vol 22, No 3, p 171-177, September 1972. 1 fig, 3 tab, 8 ref.

Descriptors: *Nutrient requirements, *Ammonium compounds, *Moisture availability, *Soil moisture, Wheat, Growth rates, Foliar application, Soil treatment, Water utilization, Semiarid climates, Cultivation, Nitrogen.
Identifiers: *Israel.

The effect of foliar and soil top-dressing of liquid ammonium nitrate, applied 5-7 days prior to heading of main culms, was studied under three different water regimes in a pot experiment. The effect of nitrogen treatments on dry matter accumulation was closely associated with the moisture level. The highest rate of growth was achieved by nitrogen treatment to pots kept at field capacity and the lowest rate by the same treatments kept at 30 percent available moisture. Foliar treatments induced an immediate effect on rate of growth, especially at the lowest moisture level, whereas, soil treatment tended to have a lasting effect on rate of growth, especially at the highest moisture level. Plant yield was significantly correlated with the number of tillers, spikes, and grains per plant. Soil application of nitrogen was more efficient than foliar application in increasing all of these parameters. Under semiarid conditions where moisture is limited, it might be desirable to seed populations having plant areas conducive to tillering, whereas under conditions where high plant density is practiced, and a good moisture supply is guaranteed, tillering would be undesirable. Application of foliar top dressing of ammonium nitrate would be more effective. (Bahre-Arizona)

SALT AND MEAL-SALT HELP DISTRIBUTE CATTLE USE ON SEMIDESERT RANGE,
Forest Service (USDA), Tucson, Ariz. Rocky Mountain Forest and Range Experiment Station.
S. C. Martin, and D. E. Ward.
Journal of Range Management, Vol 26, No 2, p 94-97, March 1973. 3 fig, 1 tab, 9 ref.

Descriptors: *Arizona, *Salt tolerance, *Livestock, *Grazing, *Water requirements, Toxicity, Range management, Water demand, Forage grasses, Semiarid climates.
Identifiers: *Santa Rita Experimental Range (Ariz).

A study was conducted on the Santa Rita Experimental Range (near Tucson, Arizona), to determine whether salt or meal-salt mixtures were effective in improving distribution of grazing use, and whether livestock were affected detrimentally by placing either salt or meal-salt at remote locations on semidesert range. It was observed that placing salt away from water does not hurt cattle either by depriving them of adequate salt or by making them thirsty. Cows ate less than 1/2 lb/day of 3:1 meal-salt mix when it was fed 1 to 2 1/2 miles from water. No injury to cattle due to either inadequate or excessive salt was determined; however, low intake of supplement where mixtures contain as much as 25% salt may be a problem if fed far from water. The grazing distribution problem will not be solved by placement of salt or meal-salt alone, but in many cases, use on heavily grazed areas near water can reduce grazing damage only by appropriate periods of deferment or rest. Akademiya Nauk SSSR, Ufa. Bashirskii Filial.
L. I. Sergeev, and F. S. Japparov.
Beit Trop Subtrop Landwirtsch Tropenveterinaer Med. Vol 8, No 4, p 303-308. 1970. Illus. English summary.
Identifiers: Fertilization, *Nitrates, *Sodium chloride, *Sugar beets, Sylvinite, Water status.

Effect of NaNO3, NaCl and sylvinite on the water-keeping capacity of leaves was studied, using the Arland wilting method. The water-keeping capacity was increased most (at an average of 14%) by adding NaCl. The sugar yield of soils poor in Na could be increased by 20-30% by means of Na salt fertilization.--Copyright 1973, Biological Abstracts, Inc.

WATER TREATMENT FOR HIGH PRESSURE BOILERS,
K. W. Herman, and L. R. Gelosa.
Power Engineering, Vol 75, No 5, p 64-66, May 1973. 4 fig.

Descriptors: Water treatment, *Boilers, *Boiler feedwater, *Corrosion, Water quality control, Heat transfer, Thermal water, Conduction, Pretreatment (Water), Mechanical engineering, Steam turbines, Hydrogen, Sludge, Filtration, Volatility, Water quality control.

Along with the problems high pressure boilers share with lower pressure boilers, they also have special difficulties. Overheating can result in gross ductile distortion and rupture of metal. Fluid film concentration results in dissolved solids being concentrated in a thin film of water when steam is formed and can cause deposits and corrosion. Diffusion of atomic hydrogen in the boiler metal produces methane gas resulting in blistering and cracking. Silica may volatilize in steam and cause deposits in turbines. The three main objectives of water treatment are to prevent scales, corrosion, and carryover. One treatment, called precision control is based on maintaining 2 to 4 ppm of phosphate and 15 to 50 ppm of hydrate alkalinity in the boiler to prevent calcium deposits and sludge buildup and to minimize silica volatilization. Coordinated phosphate pH control was developed to prevent caustic gouging. Volatile treatment uses hydrazine and neutralizing amines or ammonia. Purified water is also a means of preventing problems. WATER STRESS IN 'TUROA' RED CLOVER UNDER 'AOTEA' WHEAT,
Lincoln Coll. (New Zealand). Dept. of Plant Science.
C. T. Dougherty.
N Z J Agric Res. Vol 15, No 4, p. 706-711. 1972.
Identifiers: Clover, Moisture, *Soil water stress, Trifilium-Pratense, Triticum-Aestivum, *Wheat (Aotea), *Red clover (Turoa), New Zealand.

Red clover (Trifolium pratense L. cv. 'Grasslands Turoa') established with wheat (Triticum aestivum L. cv. 'Aotea') in Canterbury was under considerable water stress during reproductive stages of development of the cereal, even when the soil water potential in the top 15 cm was approximately-1 bar. The unfavorable light and moisture environment of the red clover under wheat severely restricted root development to a few centimeters of the soil surface, where much less water was available than at greater depths.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF TISSUE HYDRATION ON NITROGEN METABOLISM IN BARLEY LEAVES, (IN RUSSIAN),
Leningrad State Pedagogical Inst. (USSR).
N. N. Savitskaya.
Fiziol Rast. Vol 19, No 4, p 776-780. 1972. (English summary).
Identifiers: *Barley leaves, Drought, Hydration, Leaves, *Metabolism, *Nitrogen, *Tissue hydration (Plants).

The effect of drought on N metabolism was studied in barley leaves. The samples for analysis were taken after irrigation ceased and water deficiency in soil gradually increased. The total water content in leaf tissues was determined as well as protein and non-protein N. Changes in N metabolism consisted mainly in a decrease of the content of protein N. This reaction was found at the very early stages of dehydration when the total content of water slightly decreased. Dehydration resulted in water redistribution among the fractions and a decrease of the fraction of free water.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF AWNS AND DROUGHT ON THE SUPPLY OF PHOTOSYNTHATE AND ITS DISTRIBUTION WITHIN WHEAT EARS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
L. T. Evans, J. Bingham, P. Jackson, and J. Sutherland.
Ann Appl Biol. Vol 70, No 1, p 67-76. 1972. Illus.

Identifiers: *Awns, Carbon assimilation, Distribution patterns, *Drought, Photosynthate, *Photosynthesis, *Wheat ears.

The presence of awns doubled the net photosynthetic rate of wheat ears and also increased the proportion of 14CO2 assimilated by the ear that moved to the grain. The effect of water supply on photosynthesis and movement of assimilates was greater for leaves than ears, so that drought increased the proportion of assimilate contributed by ear photosynthesis to grain filling 13%-24% in the awnless ears, and 34%-43% in the awned ears. 14C assimilated by the ears was most important to the economy of the upper spikelets and to the distal florets in each spikelet, whereas flag leaf assimilate went mainly to the spikelets in the lower half of the ear, and to the proximal florets. Awns increased grain yield in the dry but not in the irrigated treatment, despite the large contribution of awned ears to grain filling. Either the supply of assimilate did not limit grain yield when water supply was not limiting, or there were compensating disadvantages to awns. However, they did not seem to have any adverse effect on the development of the upper florets, nor did they reduce grain number per ear.--Copyright 1973, Biological Abstracts, Inc.

EFFECT ON WHEAT YIELD AND NITROGEN UPTAKE FROM MANURES MADE FROM SPENT-SLURRY,
R. D. Laura, and M. A. Idnani.
Plant Soil. Vol 37, No 2, p 283-295, 1972. Illus.
Identifiers: Decomposition, Flocculation, *Manures, Microbial studies, *Nitrogen, Peptizing reactions, Phosphates, *Slurry, Urea, *Wheat yield.

The use of liquid spent-slurry gave higher wheat yield and more N uptake than sun-dried slurry. The depressing effect of sun-drying on available N in slurry was attributed to enhanced irreversibility of the flocculative and peptizing reactions of organic colloidal matter due to desiccation and thus increased resistance to subsequent microbial decomposition and mineralization of slurry N. The absorption of liquid slurry in organic absorbents like green leaf powder, dry leaf powder, and sawdust greatly enhanced its manurial value. Its absorption in inorganic absorbents like charcoal dust and ash did not increase wheat yield, but N uptake was somewhat higher than sun-dried slurry. Like ordinary farm compost, the composts prepared by composting liquid slurry with wheat straw and sorghum stover gave lower yield and low N uptake. The enrichment of slurry with urea and superphosphate gave a manure which has a higher manurial value than (NH4)2SO4 on equivalent N basis.--Copyright 1973, Biological Abstracts, Inc.

04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on the Surface

HYDRA: DYNAMIC MODEL FOR URBAN HYDROLOGIC SYSTEMS,
Nebraska Univ., Lincoln. Dept. of Computer Science.
A. J. Surkan.
Available from the National Technical Information Service as PB-222 486, $4.75 in paper copy, $1.45 in microfiche. Nebraska Water Resources Research Institute Project Completion Report, July 1973. 156 p, 13 fig, 2 tab, 4 ref, 4 append. OWRR B-016-NEB (2). 14-31-0001-3611.

Descriptors: Channels, *Computer models, Networks, Runoff, Routing, *Simulation analysis, *Urban hydrology, *Computer programs, *Storm runoff, Urban runoff, Rainfall runoff relationships.

The design and application are described of HYDRA, a new package of computer programs designed for the detailed modeling of the routing of water in converging channel networks. Geometric characteristics of intricate systems consisting of arbitrarily large numbers of channel segments can be considered. Accounted for in the simulation model are the relationships of the channel segments to each other, to surrounding areas, and to the rainfall variations and/or movement of storms. Storms are described as regions enclosed by boundaries approximated by any arbitrary number of polygon sides. The degree of detail with which either the network or storm patterns are defined may be chosen by the user. Results from this modeling package include, for finite storm events, the runoff rate and accumulated rainfall at any specified point on the network. With spatially uniform storms specificable as lengthy unevenly-sampled rainfall records, the result is a simulated continous streamflow record. In both cases, during the simulation there is a computation of several statistical estimators of the generated flow variations. The estimators computed include: mean time of arrival for the water, mean and variance of its flow rate, and the time and value of the flow rate maximum. The performance of the HYDRA package, in simulating the effect of uniform time-varying storms over an urban drainage network has been tested with ten sets of rainfall and runoff data from the Northwood area of Baltimore, Maryland. Comparisons of the simulated and observed runoff show excellent agreement using a model with only two or fewer parameters. The two scale parameters enter only as linear factors related to the overall system losses and travel times in the channels. Once they are known, the model is essentially parameter free and therefore is highly attractive for the simulation of flows at ungaged points of a network.

A MINIMUM COST WATER DISTRIBUTION NETWORK,
Michigan Univ., Ann Arbor. Dept. of Environmental and Industrial Health.
J. S. Hsu, and R. A. Deininger.
Research Report, UMICH-ENVSA-71-04, University of Michigan, School of Public Health, Ann Arbor, June 1971. 17 p, 6 fig, 2 ref, 1 append. OWRR-A-041-MICH (2).

Descriptors: *Water distribution (Applied), *Networks, *Linear programming, *Computer programs, *Algorithms, *Pipes, Size, Flow, Pressure, Data collections, Hydraulics, Mathematical models, Systems analysis.
Identifiers: *Cost minimization.

An algorithm and computer program which determine a least cost water distribution network are described. The network is assumed to be of a tree form and the algorithm used selects that combination of pipe sizes which minimize the total costs of the network while delivering the required flows at the required pressures at all points. The problem is formulated using linear programming. The computer program is written in FORTRAN IV, and is to be executed in batch mode under the MTS System of the University of Michigan. It consists of a main program and five sub-programs. Presented are: Deck set-up for batch users, a list of data input variables, control cards, the main program and its five sub-programs output. DESIGN OF OPTIMAL WATER DISTRIBUTION NETWORKS USING DYNAMIC PROGRAMMING,
Michigan Univ., Ann Arbor. Dept. of Environmental and Industrial Health.
L. C. Wu.
Research Report, UMICH-ENVSA-71-6, University of Michigan, School of Public Health, Ann Arbor, July 1971. 20 p, 2 fig, 1 tab, 1 append. OWRR-A-041-MICH (3).

Descriptors: *Dynamic programming, *Design, *Water distribution (Applied), *Networks, *Optimization, *Computer programs, *Pipes, Size, Annual, Capital costs, Constraints, Decision making, Project planning, Alternative planning, Hazen-Williams equation, Pressure, Water resources development, Economics, Mathematical models, Systems analysis.

Identifiers: Decomposition techniques.

Dynamic programming is used in analyzing a large number of system alternatives to design an optimal water distribution network. For this problem formulation, the annual capital costs for meeting discharges and pressures at various points are used. The cost is primarily that of the pipes. The length of a section of the network is given and may comprise pipes of different diameters and qualities; the quality is expressed using the Hazen-Williams formula. Using decomposition techniques, the cost expression can be broken down into a formula in which the transformations and constraints are explicitly defined for each stage. Stagewise optimization is readily achieved, and the problem is converted from a multiple decision single-stage problem into a multiple stage single-decision problem. A computer program is presented which selects the most economical pipe sizes for a water distribution network under given requirements or constraints regarding the discharges and pressures at various points in the network. AN INTERACTIVE DESIGN SYSTEM FOR WATER DISTRIBUTION NETWORKS,
Michigan Univ., Ann Arbor. Dept. of Environmental and Industrial Health.
T. J. Carlson, J. S. Hsu, and R. A. Deininger.
Research Report, UMICH-ENVSA-71-5, University of Michigan. School of Public Health, Ann Arbor, July 1971, 9 p, 3 fig, 3 ref, 2 append. OWRR-A-041-MICH (4).

Descriptors: *Water distribution (Applied), *Networks, *Design, *Computer programs, Evaluation, Economic feasibility, Optimization, Pipes, Costs, Hydraulics, Data collections, Operations research, Mathematical models.

A highly interactive system for the design of a water distribution network is described. The system of computer programs allows a designer to use a cathode-ray tube display terminal and evaluate in rapid succession alternate networks with the aim of finding an efficient one. Hopefully, by being able to evaluate many networks in a short time, the designer may come close to the optimal, least cost network. The specific terminal used in this study is a DEC 338 Cathode Ray Tube Graphics Terminal, which may be connected via telephone lines to the central computing facility at the University of Michigan which consists of an IBM 360 67 computer. Associated with the graphic terminal is a group of subroutines. The basic design system for evaluating and finding an effective water distribution network consists of a series of FORTRAN IV coded programs and subroutines which allow the designer a rapid evaluation of alternate networks. The problem is partitioned into two subproblems: (1) find a least cost network (this can be solved by linear or dynamic programming and is described in detail elsewhere); (2) find a good configuartion for the network. This is done heuristically on the CRT, and consists of a program which allows the display of a network and its interactive change. (Bell-Cornell)

Descriptors: *Multiple-purpose reservoirs, *Design, *Management, *Constraints, *Linear programming, *Decision making, Seasonal, Storage, Water supply, Recreation, Flood control, Mathematical models, Systems analysis.
Identifiers: Capacity, Intraseason, Water releases.

A probabilistic model for multi-purpose reservoir operation is reviewed and extended. The model minimizes required capacity subject to chance constraints for water supply, recreation and flood control. A linear decision rule is used to make commitments based on existing storage. A study of the structure of this linear programming formulation reveals a direct solution in the special case when as much water as possible is reliably committed, a reasonable case for water supply. The structure of the model requires an adequate degree of continuity, generally restricting the model's usage to multi-purpose reservoirs. Using an execution rule to specify when within a decision period water will be released, the model is extended to include constraints on storage within a decision period. Increasing the length of a decision period produces a large increase in reservoir capacity due to making commitments for a longer future of uncertain inflows. Numerical examples are provided which demonstrate the increased capacity required in a seasonal model over that required in a monthly model and the effect of using intraseason constraints. MODELLING THE REGULATION OF LAKE SUPERIOR UNDER UNCERTAINTY OF FUTURE WATER SUPPLIES,
Sun Oil Co., Dallas, Tex.
S. Y. Su, and R. A. Deininger.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 555-575, (1972) 8 fig, 2 tab, 13 ref.

Descriptors: *Lake Superior, *Regulation, *Water supply, *Future planning (Projected), *Markov processes, *Optimization, Stochastic processes, Reservoirs, Operation and maintenance, Water levels, Water loss, Economics, Mathematical models, Systems analysis, *Risks.

The problem of regulating Lake Superior via control at its outlet is considered. Monthly inflows to the reservoir are treated as stochastic random variables, and are assumed to be either statistically independent or correlated with the preceding month's inflow. The purpose was to find operating policies for the system which minimize the expected yearly losses in the undiscounted case, or the total expected losses over an infinite time horizon if the future losses are discounted. The system is modelled as a periodic Markovian decision problem. A general one-reservoir regulation system is described and an optimization model is developed. A new algorithm based on White's method of successive approximations for solving single-chained and completely ergodic Markovian decision problems has been developed and proven to be fairly efficient in terms of computer storage and computation. Transition probabilities of the net basin supplies are estimated from 64 years of data. Economic loss functions used in the model consist of losses due to navigation inconvenience and to shore property damage. An extensive sensitivity analysis was conducted to determine their influence on the optimal operating policies. Results show the definite possibility of reducing average yearly losses by at least 15% and monthly lake level variances by 25%. (See also W73-13134) (Bell-Cornell)

RESERVOIR MANAGEMENT: OPTIMAL PRICING AND RATIONING POLICIES UNDER UNCERTAINTY,
Montpellier Univ. (France). Faculte des Sciences.
A. Lobert, A. B. Whinston, and G. P. Wright.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 576-591, (1972). 2 fig, 20 equ, 11 ref.

Descriptors: *Reservoir operation, *Management, *Optimization, *Pricing, *Rationing (Water), *Water allocation (Policy), *Water supply, Water demand, Water delivery, Stochastic processes, Mathematical models, Systems analysis, *Risks.
Identifiers: *Water consumers, Social benefits.

This paper extends some previous work by Thomas, Whinston, and Wright, of allocating a stochastic amount of water where the parameter 'guaranteed probability of delivery' is a decision variable along with selling price in the demand functions. The water consumer sector is considered explicitly. Reviewed first are some of the results obtained from analysis of allocation models for selling water at different prices and different guaranteed delivery probabilities. Considered next is the water consumer sector, and the problem of estimating the demand functions and selling prices of different classes of water consumers differentiated by guaranteed delivery probability is discussed. Presented is an iterative and coordinative procedure for the estimation of demands, prices, and guaranteed delivery probabilities for water for a multi-period model where the supply of water, over time, is assumed to be a stochastic process. AN ANALYSIS OF SAMPLING-FREQUENCY ALTERNATIVES FOR FITTING A DAILY STREAM-TEMPERATURE MODEL,
Geological Survey, Washington, D.C.
E. J. Gilroy, and T. D. Steele.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 594-608, (1972). 13 tab, 6 ref.

Descriptors: Hydrology, *Streams, *Temperature, *Measurement, *Statistical models, *Sampling, *Frequency, Distribution, Analytical techniques, Systems analysis.
Identifiers: Daily, Harmonic parameters.

Daily stream-temperature measurements are fitted to a trigonometric regression model by using only observations obtained every I-th day in a given year for various values of I. The year-to-year variation of the parameters of the regression model has remained small over the values of I equal 1-, 7-, or 30-day increments. The largest increase in the coefficients of variation of the parameters was .04 for the amplitude of the harmonic in the case of I ± 30. A split-sample technique was used to estimate a frequency distribution of the absolute value of the residuals between observed stream temperatures and stream temperatures estimated from the harmonic function. The estimated stream temperatures are determined from a sine function fitted to only every J-th daily temperature measurement for J ± 1, 8, 15, 22, 29 in a given base year. A sample frequency distribution analysis of the residuals indicated that less-than-daily sampling frequencies give estimates of annual variation of stream temperatures that are comparable to estimates obtained from a daily sampling scheme. In: Proceedings (Vol. II) International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 677-690, (1972). 23 ref.

Descriptors: *Dynamics, *Design criteria, Estimating, Control, Optimization, Model studies, Equations, Systems engineering, Planning.
Identifiers: Experiments, Autoregressive input.

The design of experiments involves first, careful description of the experimental system, second, characterization of the properties of the estimates which may be obtained, and third, choice of the design points or of a rule for determining the design points so as to optimize those properties according to the design criterion. The problem of identification of system dynamics is an important one to hydrologists. Much work has been done, from different starting points and with different perspectives and philosophies; a difficulty with this is the evolution of different nomenclature in each field, such as in the use of the term 'system identification.' The problem is discussed of designing an input to a dynamic system in order to best estimate the parameters in the model, according to some design criterion. General requirements of dynamic experimental designs are discussed. Two criteria are selected and applied to the simple case of discrete first-order dynamics. Design criteria used are precise estimation and precise control. Optimal input signals for these cases are derived and similarities and differences between the two criteria are explored. Extensions of the model are made to expose the sensitivity of the optimal inputs to changes in the assumed model, and to stress the necessity for multiple criteria of experimental design. Descriptors: *Multiple-purpose reservoirs, *Reservoir storage, *Water shortage, *Reliability, *Water supply, *Flood control, Measurement, Water yield improvement, Seasonal, Runoff, Probability, Mathematical models, Systems analysis.
Identifiers: *Retention levels, *Llyn Celyn reservoir (North Wales), *River Dee (Wales).

In 1965, the Llyn Celyn regulating reservoir in North Wales was completed, primarily to augment the natural yield of the River Dee, but also for flood control. Monthly retention levels were established on an ad hoc basis and the system has operated effectively ever since. However, there exists no definition of what level of reservoir storage constitutes shortage, and consequently no measure of the reliability of the system. The River Dee Regulation Research Programme has derived optimal retention levels. Their derivation depends upon the repeated use of a recursive probabilistic model which uses estimates of the correlated probability distributions of runoff in the controllable and uncontrollable parts of the catchment for each month of the year. The use of the model to evaluate the present retention levels has suggested that perhaps more importance is attached, implicitly, to the secondary but more immediately perceived objective of mitigating floods than the primary aim of maintaining supply. Use of the model to explore, for different definitions of failure of the system, the dependence of return periods upon the monthly retention levels is described. Optimal retention levels for different desired return periods of shortage are compared with present operating levels. (See also W73-13134) (Bell-Cornell)

CONCERNING THE CALCULATION OF LEVEL VERIATION OF CUTOFF WATER BALANCE,
Gruzinskii Nauchno-Issledovatelskii Institut Gidrotekhniki i Melioratsii, Tiflis (USSR).
I. V. Khomeriki.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 926-933, (1972). 1 tab, 8 ref.

Descriptors: *Water balance, *Monte Carlo method, *Stochastic processes, *Probability, *Hydrology, Influents, Withdrawal, Lakes, Basins, Mathematical models, Systems analysis.
Identifiers: *Closed water bodies, *Water level.

The calculation of expected levels of closed lakes is close to the general problems of water economy systems, although difficulties of such calculations have specific character connected primarily with withdrawal of water from influents and directly from water bodies for the development of irrigated farming and water consuming industry. Secondly, the difficulties of such calculations are associated with the stochastic character of hydrological and meteorological processes as the components of the water body balance to be taken into account. Presented are some considerations relating to the constructions of a calcuated model of the regime of a closed water body based on the Monte Carlo method. The following principle forms a basis for constructing the model: A single law of distribution is selected for probabilistic processes and the models of all components of the balance, based on the hypothesis of ergodicity, are to be gameplayed and the water balance calculations performed. MAGNITUDE AND FREQUENCY OF FLOODS IN SMALL DRAINAGE BASINS IN IDAHO--A DESIGN METHOD,
Geological Survey, Boise, Idaho.
C. A. Thomas, W. A. Harenberg, and J. M. Anderson.
Geological Survey open-file report, April 1973. 43 p, 11 fig, 4 tab, 15 ref, append.

Descriptors: *Flood forecasting, *Flood frequency, *Flow characteristics, *Streamflow, *Idaho, Methodology, Regression analysis, Mathematical studies, Equations, Peak discharge, Topography, Geology, Vegetation, Land use.

A method is described for estimating peak discharges at 10-, 25-, and 50-year recurrence intervals for most small streams in Idaho. Reliable estimates can be obtained using this method, but there are significant limitations and variations which should be considered. The method is for sites on streams with natural flow. Estimates of peak discharge may be poor for streams draining basins on, or flowing across, extensive areas of deep, coarse alluvium or lava flows; for streams whose basins are urbanized; for streams draining irrigated agricultural lands; and for streams draining basins having less than about 30% forest cover. Computed flows in those parts of the State subject to recurrent high intensity thunderstorms over small areas may be too low to be acceptable as reasonable estimates. Some anomalous areas have been identified where the method developed does not apply. (Woodard-USGS)

Identifiers: *Santa Rita Experimental Range (Ariz), Annuals, Perennials.

Ranging from continuous year-long grazing to year-long rest 2 years out of 3, 15 schedules of rest and grazing of perennial grasses on semidesert range in southern Arizona were evaluated from 1962 to 1969. Over this 8 year period spring-summer rest 2 years out of 3 produced the greatest improvement in the stands of perennial grasses. While herbage yields of annual grasses were negatively related to rainfall of the preceding June-January, yields of perennial grasses were more closely associated with the sum of current and past summer rainfall. This study indicates also that under any grazing system forage stands will improve during favorable growing seasons and decline during droughts and that the impact of weather on vegetation changes is often greater than the influence of management. Currently, a pilot test of a 3-pasture grazing system providing spring-summer rest 2 years in 3 is being conducted on the Santa Rita Experimental Range and is expected to demonstrate benefits to the range, the livestock, and the rancher. Identifiers: *Cheatgrass.

Throughout southern Idaho cheatgrass, an introduced winter annual, occupies vast areas, producing good forage and displaying an aggressive growth pattern. Nonetheless, it has many undesirable characteristics. Major one are early drying, high fire hazard, a short green-feed season, variable production is often replaced by weedy plants and is susceptible to replacement by medusahead. Efforts to improve the value of these rangelands by establishing more desirable perennial grass cover led to this study of planting techniques in dense stands of cheatgrass. Seeded grass stands were successful when cheatgrass was reduced to 12 plants per square foot during the initial growing season. Deep furrow drilling in the fall gave the best stands, followed by fall cultivation and drilling, and then by summer fallow and drilling. In low rainfall areas fall seeding is recommended, especially when cheatgrass has germinated early and rather completely. While not a recommended control, treatment with herbicides followed by drilling gave good seeded stands the first year. Seeding success was directly related to the kill of cheatgrass. (Gloyd-Arizona)

GRASS AND GRASS UTILIZATION IN ICELAND,
Agricultural Research Inst., Reykjavik (Iceland).
S. Fridriksson.
Ecology. Vol 53, No 5, p 785-796, 1972. Illus.
Identifiers: Cattle, Control, *Erosion, Fodder, *Grass, Human population, *Iceland, Ponies, Sheep, Soils.

The total area of Iceland is approximately 103,500 km2 of which 40,000 km2 presumably was covered with vegetation at the time of settlement in 874 A.D. During the 1100 yr of occupancy, serious erosion has taken place, resulting in the deterioration of the grassland. At present, the total area of vegetation is only 20,000 km2 giving an average annual erosion rate of 20 km2. As the human population, which reached 80,000 individuals during the Age of Settlement, relied to a great extent on animal products it was indirectly dependent on the output of the natural grassland that dwindled with time and thus the human population decreased up to the last century. With modern cultivation techniques, erosion is gradually being checked and it has been possible to provide fodder for the nation's increased livestock. Today the natural grassland, which to some extent is overstocked, provides summer pasture for 800,000 sheep and 30,000 ponies while the lowland pastures around the homesteads supply grazing for 60,000 dairy cattle. Sheep and cattle are housed and fed indoors on hay and artificial feeds during the winter months. Half the fodder is now obtained from cultivated land. Thus the Icelandic agriculture is, at present, capable of supporting a nation of 200,000 individuals.--Copyright 1973, Biological Abstracts, Inc.

PROPOSED CENTRAL ARIZONA PROJECT (FINAL ENVIRONMENTAL STATEMENT). AVAILABLE FROM THE NATIONAL TECHNICAL INFORMATION SERVICE AS EIS-AZ-72-5-357-F1. BUREAU OF RECLAMATION, BOULDER CITY, NEVADA. (FES 72-35) SEPTEM BER 1972, 597 P. MAPS. 203 REF.
Bureau of Reclamation, Boulder City, Nev. Region 3.

Descriptors: *Environmental effects, *Water conveyance, *Aqueducts, *Multiple purpose, Water utilization, *Arizona, Water resources development, Water resources, Reservoirs, Alternate planning, Cost-benefit analysis, Aesthetics, Deserts, Environment, Maps, Canals.
Identifiers: Central Arizona Project, *Lake Havasu (Ariz).

A long-term average of 1.2 million acre-feet of water will be pumped annually from Lake Havasu for multipurpose uses. This new supply of water will be managed with local supplies to provide flexibility in meeting the demand for water imposed by municipal, industrial, and agricultural uses. Project water will be used as a replacement for ground water. The aqueduct system will be about 371 miles long and require about 16,000 acres of right-of-way supporting mostly desert shrub vegetation. The four reservoirs will require about 38,000 acres typically supporting deciduous treex near the channel and mesquite, grasses, forbs, cacti, and associated desert shrubs on the adjacent terraces. The existing biota and esthetic values will be influenced by the construction of reservoirs and the physical modification of topography and vegetation resulting from construction of project features. Some Indian lands and primitive and wilderness areas will be affected. Sections included in the statement are: description of the proposal, description of the environment, environmental impact of the C.A.P., environmental considerations including mitigation and enhancement features included in the proposed action, adverse impacts which cannot be avoided, the relationship between short-term use of the environment and the maintenance and enhancement of long-term productivity, irreversible and irretrievable commitments of resources involved in the C.A.P., alternatives to the project, and consultation and coordination. ANALYSIS OF SOME INORGANIC CONSTITUENTS IN WELL WATERS AND THEIR SEDIMENTS,
Dental Coll. Hospital, Lucknow (India). Fluoride Study Unit.
R. S. Nanda, and K. Kapoor.
Indian J Med Res. Vol 60, No 6, p 949-952. 1972.
Identifiers: Inorganic constituents, Sediments, *Well water, Sampling, *Water analysis.

Well water samples (100) were analyzed for their contents of fluoride, phosphate, Mg, Ca, chloride and hardness for each of the 3 seasons to discover if there were differences in the concentration of these constituents in the sedimented and respective clear samples. A study of seasonal variation in sediments and clear samples was included. All these constituents were significantly greater in the sediments than in the clear samples in the summer. Fluoride, phosphate and Mg in the winter sediment samples were significantly higher. Analysis of variance applied to the data revealed significant seasonal differences for each constituent.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Geophysics, *Electrical studies, *Exploration, *Hydrogeology, Aquifer characteristics, Groundwater, Water quality, Surveys, Glacial drift, *Missouri, Conductivity, Resistivity.

Geoelectrical investigations were used to find aquifers in glacial deposits in Grundy County of northwestern Missouri. The groundwater resources of the glacial deposits have already been examined through an extensive drilling program. Water-bearing gravel deposits can be distinguished from glacial deposits containing appreciable amounts of clay and limited amounts of water. The Schlumberger method used for the geoelectric depth soundings in the vicinity of the drillholes demonstrates the exploratory usefulness of the method in that it can partly replace drilling. The method also provides improved interpretation between drillholes. Clay has a resistivity below 20 ohm-m, the freshwater-bearing gravel at the bottom of the buried glacial stream channels has a resistivity of 40 to 50 ohm-m, and the near surface glacial gravel deposits have a resistivity above 100 ohm-m. Interpretation of the depth soundings and the conductivity of water obtained from a local well implies that its water is drawn from the saline water of the bedrock. (Knapp-USGS)

CLOGGING IN SIMULATED GLACIAL AQUIFERS DUE TO ARTIFICIAL RECHARGE,
Illinois Univ., Chicago. Dept. of Geological Sciences.
D. P. Ripley, and Z. A. Saleem.
Water Resources Research, Vol 9, No 4, p 1047-1057, August 1973. 6 fig, 2 tab, 21 ref.

Descriptors: *Artificial recharge, *Injection wells, *Water quality, *Clogging, Glacial drift, Aquifers, Well filters, Recharge, Bacteria, Turbidity.
Identifiers: Aquifer clogging.

Clogging due to artificial recharge was tested in laboratory simulated unconsolidated aquifers. Recharge with turbid water containing an effective microbial inhibitor showed clogging throughout the aquifers ranging in length from 48 to 123 cm. The rate of clogging at different depths was dependent on the size distribution of the particles in the water relative to the pore size distribution of the porous media. Clogging tended to be more severe at the influent portion of the sample; however, when the particles in the recharge water were smaller in size or when the pore sizes of the porous media were larger, the result was a more uniform rate of clogging with respect to depth. Recharge with nonturbid water and no effective microbial inhibitor shows clogging only in the top few centimeters. If it is not understood that these two patterns result from different causes, such a pattern resulting from the combined factors could be attributed to only one cause, turbidity. (Knapp-USGS)

GROUND-WATER DISCHARGE FROM THE EDWARDS AND ASSOCIATED LIMESTONES, SAN ANTONIO AREA, TEXAS, 1972.
Geological Survey, Austin, Tex.

Edwards Underground Water District Bulletin 31, July 1973. C. Puente, Compiler. 8 p, 1 tab, 12 ref.

Descriptors: *Groundwater, *Texas, *Water yield, *Discharge (Water), Aquifers, Wells, Springs, Data collections.
Identifiers: Edwards Limestone (Tex), *San Antonio (Tex).

The estimated total well and spring discharge from the Edwards and associated limestones in the San Antonio area of Texas during 1972 was 747,100 acre-feet, which is the record high for the period 1934-72. The increase was due primarily to above-average springflow. The total discharge from wells and springs for 1972 was about 10% more than in 1971, and 38% greater than the average for 1934-71. About 50% of the total discharge came from wells, and approximately two-thirds of this discharge was from wells in Bexar County. Well discharge in 1972 was 10% less than in 1971, while springflow increased by about 37%. (Knapp-USGS)

USE OF A NEUTRON MOISTURE PROBE TO DETERMINE THE STORAGE COEFFICIENT OF AN UNCONFINED AQUIFER,
Geological Survey, Garden City, Kans.
W. R. Meyer.
Geological Survey Professional Paper 450-E, p E174-176, 1962. 1 fig, 2 tab, 2 ref.

Descriptors: *Pump testing, *Storage coefficient, Unconsolidated aquifers, Theis equation, *Field capacity, Well data, *Kansas, Dewatering, Observation wells.
Identifiers: *Neutron moisture probe, Unconfined aquifers, Alluvial aquifers.

Under field conditions, the storage coefficient of an unconfined aquifer was determined by using the Thiem equation and a modified form of the Theis nonequilibrium formula to analyze the drawdown data from a pumped well. These results were compared with those obtained by using a neutron moisture probe placed at various depths in the aquifer. Values for the storage coefficient as determined by the Thiem and Theis equations were 0.19 and 0.21 respectively; as determined by the moisture probe (measuring moisture content before and after drainage) the storage coefficient was 0.215. (Campbell-NWWA)

A PERISCOPE FOR THE STUDY OF BOREHOLE WALLS, AND ITS USE IN GROUND-WATER STUDIES IN NIAGARA COUNTY, NEW YORK,
Geological Survey, Washington, D.C.
F. W. Trainer, and J. E. Eddy.
Geological Survey Professional Paper 501-D, p D203-206, 1964. 2 fig, 3 ref.

Descriptors: *Logging (Recording), Water wells, Dolomite, Carbonate rocks, *Boreholes, Fractures (Geologic), Gypsum, *Groundwater availability, *New York.
Identifiers: *Periscopes, *Borehole studies, Solution cavities, Temperature logs, *Permeable zones, Niagara County (NY).

A periscope made of aluminum tubing with a mirror and light at one end and a telescope at the other was used to study fractures in dolomite in shallow drill holes in western New York. Correlation of fractures observed with the periscope with inflections in temperature profiles in a well where downward flow occurs during periods of no pumping confirmed that the inflections coincide with waterbearing fractures in the rock. The periscope has also been used for examining well casings, well screens, and pump columns, and, in some places, for determining the texture and composition of the wallrock. (Campbell-NWWA)

ESTIMATING WATER QUALITY FROM ELECTRICAL LOGS,
Geological Survey, Baton Rouge, La.
A. N. Turcan, Jr.
Geological Survey Professional Paper 450-C, p C135-136, 1962. 2 fig, 1 tab, 6 ref.

Descriptors: Logging (Recording), *Electrical well logging, *Resistivity, Salinity, Chlorides, Water quality, *Louisiana, Standards.
Identifiers: Chloride ion concentration, *Conductance, Empirical methods, Wilcox group.

A Louisiana study has shown that it is generally possible to calibrate the readings of the electric log in terms of water salinity for a given area. By finding the resistivity of the formation tapped and applying a factor known as the field formation resistivity factor, which is the ratio of formation resistivity to formation water resistivity, the formation water resistivity could be calculated. Too low a value for formation water resistivity indicates salinity greater than accepted standards for fresh water. All values must be determined for each particular area. (Campbell-NWWA)
W73-13556

A PORTABLE SAMPLER FOR COLLECTING WATER SAMPLES FROM SPECIFIC ZONES IN UNCASED OR SCREENED WELLS,
Geological Survey, Ocala, Fla.
R.N. Cherry.
Geological Survey Professional Paper 525-C, p C214-216, 1965. 1 fig, 1 tab.

Descriptors: Water wells, *Sampling, Logging (Recording), Pumps, *Water quality, Dissolved solids, *Water analysis, Groundwater, Florida.
Identifiers: *Submersible pumps, *Water-bearing zones, Fracture zones, Inflatable packers.

A water sampler for use in uncased or screened wells which tap more than one water-bearing zone is described. It consists of two inflatable packers, and of a submersible pump which removes water from the section of the well isolated by the packers. Auxiliary instruments can be used to measure temperature, specific conductance, or other characteristics of the water in the isolated interval during pumping. The sampler is easily handled and is readily moved from one position to another and reset without removing it from the well. (Campbell-NWWA)

THE EFFECT OF URBANIZATION ON RUNOFF QUANTITY,
Delaware Univ., Newark. Dept. of Civil Engineering.
G. L. Grunkemeyer.
M Sc Thesis, May 1972. 84 p, 31 fig, 12 tab, 20 ref. OWRR-A-017-DEL (1).

Descriptors: *Urban hydrology, *Urbanization, *Delaware, *Rainfall-runoff relationships, Water balance, Infiltration, Suburban areas.
Identifiers: *Red Clay Creek (Del), *Wilmington (Del).

Red Clay Creek drainage basin, Delaware, is being developed into a populated and urbanized area. Runoff from Red Clay Creek basin showed a decreasing trend during the 1944 through 1969 period of study. This decrease was cuased by an even greater decreasing trend in precipitation. The fact that runoff dropped by a lesser amount than did precipitation reflects an increasing trend in runoff. Basic land use in Red Clay Creek basin is agricultural. Ground slopes range from nearly flat to as high as 15% to 18%. Woodlands still cover over one quarter of the basin's land area. Slightly less than one quarter of the basin is used for pastures. Urbanization is only in the first stages. Urban development probably will increase during the next decade because of the basin's proximity to Wilmington. (Knapp-USGS)

ECOLOGICAL EFFECTS OF SNOWMOBILES,
Carleton Univ., Ottawa (Ontario). Dept. of Biology.
P. W. Neumann, and H. G. Merriam.
Can Field Nat. Vol 86, No 3, p 207-212. 1972.
Identifiers: *Canada (Ottawa), Ecological effects, Fox, Hare, Pine, *Snowmobiles.

Ecological impact of snowmobiles was studied in the Ottawa area, Canada. Snow structural changes by snowmobiles had significant effects on temperature gradients, water holding capacity and melting rate. Snowshoe hare and red fox mobility and distribution also were affected. Snowmobile damage to hardwood saplings and planted pines was significant. Browsing was unaffected except on damaged saplings.--Copyright 1973, Biological Abstracts, Inc.

DETERMINATION OF LOW PHOSPHATE CONCENTRATIONS IN SEAWATER BY AN ISOBUTYL ACETATE EXTRACTION PROCEDURE,
Osservatorio Geofisico Sperimentale, Trieste (Italy).
B. S. Cescon, and P. G. Scarazzato.
Limnology and Oceanography, Vol 18, No 3, p 499-500, May 1973. 1 tab, 3 ref.

Descriptors: *Phosphates, *Sea water, *Water analysis, *Solvent extractions, Chemical analysis, Solvents.
Identifiers: Isobutyl acetate.

Isobutyl acetate is proposed as an extracting reagent for the determination of low phosphate concentrations in seawater. Because this ester is immiscible with water, its use improves both the accuracy and the ease of the method. (Knapp-USGS)
W73-13057

THE POLAROGRAPHIC DETERMINATION OF TRACE AMOUNTS OF CYANIDE,
Salford Univ. (England). Dept. of Chemistry and Applied Chemistry.
L. S. Bark, and B. S. Lim.
Water Research, Vol 7, No 8, p 1209-1213, August 1973. 2 fig, 13 ref.

Descriptors: *Water analysis, *Poisons, *Polarographic analysis, Copper, Chemical analysis, Industrial wastes, Pollutant identification.
Identifiers: *Cyanide.

A method is proposed for the indirect determination of trace amounts of cyanide. After release and distillation of the cyanide, which is collected in 1.0 M sodium hydroxide, the cyanide is reacted with a known and excess amount of copper (II) ions. The excess of the Cu (II) ions is determined by polarography, and from the amount of Cu (II) which has reacted, the amount of cyanide originally present is calculated. (Knapp-USGS)

ENZYMATIC NH3-N DETERMINATION: A SPECIFIC METHOD FOR THE DETERMINATION OF AMMONIA IN WATER AND SEDIMENTS,
Hydrobiologisch Institutt, Nieuwersluis (Netherlands).
H. Verdouw.
Water Research, Vol 7, No 8, p 1129-1136, August 1973. 4 fig, 3 tab, 9 ref.

Descriptors: *Ammonia, *Nitrogen, *Chemical analysis, *Enzymes, *Water analysis, Sediments, Water quality, Organic compounds.

An enzymatic method for the determination of ammonia-nitrogen, not previously applied in water research, is described. The method is specific for NH3-N, and the risk of hydrolysis of organic nitrogen compounds is very small, because of near neutral pH and low (room) temperature conditions. Differences between results of enzymatic NH3-N determination and of a distillation method depend on the type of water. The method was adapted for application in sediment research, where the exchangeable NH3-N fraction is determined directly, without an extraction procedure. In comparison with this method, direct distillation of sediment samples gave an overestimation of the NH3-N content of 40%. (Knapp-USGS)

DETECTING AND MEASURING OIL ON WATER,
Delaware Univ., Newark. Coll. of Marine Studies.
V. Klemas.
Instrum Technol., Vol 19, No 9, p 54-59, 1972. Illus.
Identifiers: *Oil pollution, Water pollution sources, *Pollutant identification, Measurement.

Any difference in the properties of oil and water offers a potential method for detection pollution. Successful detectors can discriminate among different oil types and are not confused by other pollutants which may resemble oil. A group of detectors which have had some success is examined from the viewpoints of the effects exploited and how much information can be delivered.--Copyright 1973, Biological Abstracts, Inc.

A METHOD FOR THE DETECTION OF TRACES OF NITROSAMINES USING COMBINED GAS CHROMATOGRAPHY AND MASS SPECTROMETRY,
Laboratory of the Government Chemist, London (England).
T. A. Gough, and K. S. Webb.
Journal of Chromatography, Vol 79, p 57-63, May 16, 1973. 6 fig, 3 tab, 13 ref.

Descriptors: Water analysis, *Food, *Gas chromatography, *Mass spectrometry, Separation techniques, Time, Laboratory equipment, *Pollutant identification.
Identifiers: *GC-Mass spectrometry, *Nitrosamines, Pyrrolidylnitrosamine, Piperidylnitrosamine, Dibutylnitrosamine, Dipropylnitrosamine, Dietaylnitrosamine, Dimethylnitrosamine, Pressure programming, Carcinogens, Chromatograms.

A gas chromatography and high-resolution mass spectrometer, coupled via a membrane separator, were used for the analysis of samples of water and foods for traces of nitrosamines. The nitrosamines studied were dimethyl, diethyl, diprophyl, dibutyl, piperidyl, and pyrrolidyl. The nitrosamines were detected by parent ion monitoring with a detection limit of 1 mg/l on injected material. The gas chromatography incorporates a pressure-programming and peak-cutting device which is described in detail. Overall analysis time is substantially shorter than for isothermal or temperature-programmed runs. (Little-Battelle)

Identifiers: *Amberlyst XAD-7, *Liqud chromatography, Chlorophenol, Methylphenol, Bromophenol, Cresols, o-Bromophenol, p-Bromophenol, M-Bromophenol, 2 4-Dibromophenol, Pentabromophenol, o-Chlorophenol, p-Chlorophenol, m-Chlorophenol, 2 4 -Dichlorophenol, 3 5-Dichlorophenol, 2 3 6-Trichlorophenol, 2 3 4 5-Tetrachlorophenol, p-Cresol, Pentachlorophenol, m-Cresol, o-Cresol, 3 5-Dimethylphenol, 2 6-Dimethylphenol, 3 4 5-Trimethylphenol, 2 4 6-Trimethylphenol, Organic solvents, Chromatograms, Distribution coefficients.

A liquid chromatograph is described that uses gas pressure on water to force eluents through the column. A macroporous polyacrylate resin, Amberlyst XAD-7, was used in conjunction with

methanol-water or basic aqueous eluents for separation of mixture of phenols. The elution characteristics of twenty-one phenols are described. These included bromophenols, chlorophenols, cresols, and methylphenols. Several separations of actual mixtures are shown to demonstrate the separation capabilities of this system. (Little-Battelle)

POLARIZATION: A KEY TO AN AIRBORNE OPTICAL SYSTEM FOR THE DETECTION OF OIL ON WATER,
National Aeronautics and Space Administration, Moffett Field, Calif. Ames Research Center.
J. P. Millard, and J. C. Arvesen.
Science, Vol 180, No 4091, p 1170-1171, June 15, 1973. 2 fig, 4 ref. *Oil spills, *Aerial photography, *Remote sensing, Water pollution, *Pollutant identification, Oil pollution, Reflectance, Opical properties, On-site data collections, Cameras, Thin films, Photogrammetry.

Decriptors: *Oil spills, *Aerial photography, *Remote sensing, Water pollution, *Pollution identification, Oil pollution, Reflectance, Optical properties, On-situ data collections, Cameras, Thin films, Photogrammetry.
Identifiers: *Aerial surveillance, *Skylight polarization, *Optical systems, Polarization, Azimuths.

The detection of oil slicks can be improved by utilizing polarization techniques. Good contrast was obtained in a study of oil slicks by viewing a specific polarization component. Skylight polarization, which varies with the position of the sun in the sky, influences the contrast of oil on water. Good contrast is most consistently obtained by viewing in azimuth directions toward or away from the sun. Contrast is enhanced by imaging selected polarization componenets and by taking the difference between orhtogonal polarization components. (Holoman-Battelle)
W73-13167

SEPARATION OF NTA AND EDTA CHELATES BY THIN-LAYER CHROMATOGRAPHY,
Environmental Health Directorate, Ottawa (Ontario).
F. J. M. Rajabalee, M. Potvin, and S. Laham.
Journal of Chromatography, Vol 79, p 375-379, May 16, 1973. 5 tab, 10 ref.

Descriptors: *Separation techniques, *Pollutant identification, Aqueous solutions, Color reactions, Alkali metals, Heavy metals, Methodology, Nitrilotriacetic acid, Chemical analysis, Solvents, Sodium, Cadmium, Copper, Nickel, Zinc, Cobalt, Lead, Cations.
Identifiers: *Thin layer chromatography, *Metal-EDTA chelates, *Metal-NTA chelates, Mixtures, Chromagenic reagents, Metal chelates.

The chromatographic behavior of metal-NTA chelates on silica gel is described as well as their separation from the corresponding EDTA chelates. The metal-EDTA and metal-NTA chelates, and metal ions were applied to silica gel thin-layer plates in aqueous solutions. The amount spotted was 0.5 microgram for the metal ions and NTA chelates, and 2 micrograms for the EDTA chelates. The spots were revealed by the praying technique and the colors observed in daylight. At high pH (solvents containing more than 1 percent of ammonia) chelate decomposition occurs and, in several cases, double fronts are observed. Only the nickel-NTA chelates were stable under these conditions. In weekly basic and neutral solvents, separation occurred and reliable R sub F values were obtained. These were identical for the different NTA chelates of the same metal, irrespective of the number of NTA moieties in the molecule. The TLC method is rather effective for separating mixtures of EDTA and NTA chelates. The metal cations can also be distinguished by the characteristic colors observed with the different spray reagents used. For a given divalent metal, the NTA chelate migrates faster in the same solvent than its EDTA analog, being less polar than the latter. (Holoman-Battelle)
W73-13168

A NEW CHROMOGENIC REAGENT FOR THE DETECTION OF PHENOLIC COMPOUNDS ON THIN-LAYER PLATES,
Punjab Agricultural Univ., Ludhiana, (India). Dept. of Chemistry and Biochemistry.
I. S. Bhatia, J. Singh, and K. L. Bajaj.
Journal of Chromatography, Vol 79, p 350-352, May 16, 1973. 1 tab, 6 ref.

Descriptors: *Phenols, *Pollutant identification, *Color reactions, *Methodology, Chemical analysis, Organic acids, Chemical reactions
Identifiers: *Thin-layer plates, *Chromogenic reagents, Silica Gel G, Polyamide, Aldehydes, Bourbonal, Dihydroquercetin, Vanillic acid, Veratric acid, Syringaldehyde, Vanillin, Vanillal, Syringic acid, Ferulic acid, Isoferulic acid, Guaiacol, Hesperidin, Sinapic acid, Naringin, Thymol, Salicylic acid, Tyrosine, Picric acid, Gentisic acid, Homogentisic acid, Phloroglucinal, Rutin, Caffeic acid, Ellagic acid, Pyrocatechol, Taxifolin, Protocatechuic acid, Chlorogenic acid, Adrenaline, Quercetin, Tannic acid, Pyrogallol, Gallic acid, Methyl gallate.

A sensitive chromogenic reagent has been described that not only detects most of the naturally occurring phenolic compounds, but can also be used to detect specifically the ortho-dihydroxy group on both Silica Gel G and polyamide thin layers. Four micrograms of phenolic compounds dissolved in acetone were spotted onto thin-layer plates. The plates were sprayed with chromogenic reagent I which consists of sodium tungstate, TCA, HCl, and sodium nitrite solution. After 3 min, Chromogenic reagent II (NaOH solution) was sprayed on the plates. With polyamide, after using reagent I, the thin layers are dried at 30 degrees for a few minutes and then lightly sprayed with reagent II. Fifty-two phenolic compounds are listed giving the color reaction with the reagent on thin-layer plates. (Holoman-Battelle)

Identifiers: *Electron capture gas chromatography, *Nitrophenol, Sample preparation, Chemical recovery, Detection limits, Alkylation, Cleanup, Metabolites, Parathion, Biological samples, Excretion

A method for the determination of low levels of p-nitrophenol in rat and human urine was developed. The method involves acid hydrolysis of urine, extraction with benzene, derivatization of p-nitrophenol using an electron capture detector. Recoveries of fortified rat and human urine samples averaged in the range of 85-97 percent. The limits of detectability were 0.05 ppm for rat urine and 0.02 ppm for human urine. The method was applied to the analysis of p-nitrophenol in urine of rats exposed to 0.1 and 0.01 LD50 of parathion. (Holoman-Battelle)

ELECTRON CAPTURE GAS CHROMATOGRAPHIC ANALYSIS OF DDA: UTILIZATION OF 2-CHLOROETHANOL DERIVATIVE,
Environmental Protection Agency, Perrine, Fla. Perrine Primate Lab.
M. F. Cranmer, and M. F. Copeland.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 3, p 186-192, March 1973. 1 fig, 3 tab, 2 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, Chemical analysis, *Pollutant identification, DDT, Separation techniques, *Gas chromatography
Identifiers: *Electron capture gas chromatography, *DDA, Chemical recovery, Sample preparation, Metabolities, Derivatives, 2-Chloroethanol, Esterification, Cleanup, 2 2-Bis (p-chloropheny) acetic acid.

The use of the 2-chloroethanol derivative is reported in the electron capture gas chromatographic analysis of DDA (the carboxylic acid metabolite of DDT). The efficiency of conversion of DDA to the 2-chloroethanol derivative was 91.5 plus or minus 1.0 percent. The utilization of a silica gel column for clean up prior to electron capture analysis is discussed and the elution pattern for the 2-chloroethanol derivative is given with a recovery of 97.3 plus or minus 0.1 times more responsive to electron capture detection than the methyl ester of DDA and produces a retention time which separates the DDA from other chlorinated hydrocarbon pesticides which might interfere with the analysis. A SENSITIVE MECHANIZED DETERMINATION OF ATP PLUS ADP,
Netherlands Red Cross Blood Transfusion Service, Amsterdam. Central Lab.
J. A. Loos, R. C. H. van Doorn, and D. Roos.
Analytical Biochemistry, Vol 53, No 1, p 309-312, May 1973. 2 fig, 1 tab, 8 ref.

Descriptors: *Pollutant identification, Biochemistry, *Methodology, Enzymes, Filtration, Proteins, Centrifugation, Bioassay, Automation.
Identifiers: *ATP, *ADP, *Enzymatic tests, Sensitivity, Sample preparation, Blood, Biological samples, Sample preservation, NADH, Lymphocytes, Lysates, Erythrocytes.

A method for the mechanized determination of ATP plus ADP using a cyclic enzymatic system which was previously described has been improved to increase the sensitivity to 6 nm. The improved system differs in the way in which the conversion of ATP into ADP is measured and is based on the consumption of NADH. In the earlier

system it was necessary to free the enzyme mixture by filtration. It has been found now that all the commercially purified enzymes can be substituted by 'adolase paste' without changing the sensitivity or reproducibility. The new method yielded less than 5 percent difference with erythrocyte lysates when quenching of the fluorometric signal by haemoglobin was taken into account. With leukocytes, less than 10 percent difference was found. ATP added to these lysates was recovered quantitatively. This indicates that the determination is specific for ATP plus ADP in lysates of human erythrocytes and leukocytes. (Mortland-Battelle)

POLYCHLOROBIPHENYLS IN NORTH ATLANTIC OCEAN WATER,
Woods Hole Oceanographic Institution, Mass.
G. R. Harvey, W. G. Steinhauer, and J. M. Teal.
Science, Vol 180, No 4086, p 643-644, May 11, 1973. 1 tab, 10 ref.

Descriptors: *Polychlorinated ciphenylis, *Atlantic Ocean, *Sea water, Surface waters, Water analysis, *Pollutant identification, Organic compounds, Water pollution, Solvent extractions, Chemical analysis, Separation techniques, *Gas chromatography.
Identifiers: *Electron capture gas chromatography, On board analysis, Sample preparation, Sargasso Sea, Detection limits.

Concentrations of polychlorobiphenyls (PCB's) have been measured at the surface and at various depths in the water of the North Atlantic Ocean between 26 degrees N and 63 degrees N. Water samples were either extracted with a hexane-ether mixture, concentrated, and analyzed by electron capture gas chromatography (ECGC) or pumped through a brass or glass column packed with Amberlite XAD-2 resin, eluted with boiling acetonitrile, diluted with distilled water or seawater, extracted with hexane, concentrated and analyzed by ECGC. All analyses were completed on shipboard within 4 hours of sampling. Unfiltered seawater samples collected and analyzed simultaneously with water filtered through a 0.3-micron glass fiber filter or a glass wool plug contained a maximum of 10 percent more PCB than the filtered seawater samples. Three observations can be made from the data: (1) Although the range is very broad, the concentrations of PCB's in the northern North Atlantic average 35 ng/kg (35 parts per trillion (ppt)) in surface waters, and 10 ppt at 200 m. (2) The PCB concentrations decrease with depth. (3) The surface waters of the Sargasso Sea (stations 25-41) have slightly lower surface concentrations of PCB's (27 ppt) than surface waters in other parts of the North Atlantic. The widespread distribution of PCB's in the open North Atlantic supports previous observations that the atmosphere must be the predominant mode of transport. (Holoman-Battelle)

A SIMPLE COULOMETRIC METHOD FOR THE DETERMINATION OF CHLORIDE IN NATURAL WATER,
Oslo Univ., (Norway). Dept. of Chemistry.
E. Jacobsen, and G. Tandberg.
Analytica Chimica Acta, Vol 64, No 2, p 280-283, April 1973. 2 fig, 1 tab, 9 ref.

Descriptors: *Chlorides, *Water analysis, *Methodology, Chemical analysis, Electrolysis, Iodides, Bromides, Iron, Humus, Pollutant identification, *Volumetric analysis.
Identifiers: *Coulometry, *Natural waters, Detection limits, Ionic interference, Chemical interference, Cyanides, Thiocyanates.

A study was undertaken in order to construct a simple instrument for the coulometric titration of chloride in water. A very simple battery-operated constant-current source can be used for the titrations. Experiments showed that the current remained constant during the titration at all settings (0.1-4 mA). A 1-mm silver wire was used as generating electrode. The cathode (1-mm silver wire) was isolated in a glass tube with a fine-porosity fritted-glass disc. The shield tube was filled with the supporting electrolyte used in the sample solution. The end-point was determined by applying a constant current of about 1.1 microA between two treated silver wire electrodes and recording the potential-time curve with a strip-chart recorder. (Any kind of recorder with sensitivity in the range 1-10 mV/s can be used, provided that it is equipped with zero suppression). The proposed method is simple and rapid and gives satisfactory results in the range of 0.1-100 micrograms of chloride per ml. The method has the advantage that the blank is not affected by colored substances like iron and humus. Of common ions bromide, iodide, thiocyanate and cyanide interfere and must be absent from the solution; these ions interfere also in the spectrophotometric method. (Holoman-Battelle)

EXTRACTION AND GAS CHROMATOGRAPHIC DETERMINATION OF METHYL, -ETHYL-, AND METHOXYETHYLMERCURY (II) HALIDES,
Oak Ridge National Lab., Tenn.
J. A. Ealy, W. D. Shults, and J. A. Dean.
Analytica Chimica Acta, Vol 64, No 2, p 235-241, April 1973. 1 fig, 1 tab, 10 ref.

Descriptors: *Separation techniques, *Pollutant identification, *Solvent extractions, Sediments, Fish, Seeds, Chemical analysis, Plant tissues, Organic soils, Aquatic soils, Soil analysis, *Gas chromatography, *Halides.
Identifiers: Biological samples, *Organomercury compounds, *Mercury halide compounds, *Electron capture gas chromatography, Methylmercury halides, Ethylmercury halides, Methoxyethylmercury halides, Sample preparation, Chemical recovery, Reproducibility, Animal tissues, Methylmercury chloride, Ethylmercury chloride, Ethylmercury iodide, Methylmercury bromide, Partition coefficients, Methylmercury iodide, Ethylmercury bromide, Methoxyethylmercury chloride, Mercury radioisotopes, Hg-203.

The separation, identification, and determination of methyl-, ethyl-, and methoxyethylmercury (II) halides in biological materials were studied. The procedure developed involved a 24-h leach with 1 M sodium iodide, equilibration of the aqueous phase for 2 min with an equal volume of benzene, and then injection of an aliquot of the benzene phase onto a gas chromatographic column consisting of 5 percent cyclohexanedimethanol succinate held on Anakrom ABS. Excellent baseline separation of the chromatographic peaks was obtained. The extraction steps were monitored with RHgX compounds tagged with Hg-203. Partition coefficients are reported for methyl- and ethylmercury (II) chlorides, bromides, and iodides; several overall formation constants of the anionic complexes RHgCl sub n to the 1-n power (n equals 2,3) were determined. Results are reported for the recovery of methyl- and ethylmercury (II) halides from inoculated rye seed, humic and inorganic sediment, and fish grown in an aquarium. A single 24-h leach of 1-g samples gave the following D values: 12.0 plus or minus 0.2 for inorganic sediment; 7.7 plus or minus 0.5 for organic sediment; 5.6 plus or minus 0.8 for fish tissue; and 9.0 plus or minus 0.5 for rye seeds. W73-13182

THE NEW METHOD FOR THE DETERMINATION OF COBALT IN SEA WATER BY SOLVENT EXTRACTION WITH 2-NITROSO--5-DIETHYLAMINOPHENOL,
Okayama Univ. (Japan). Faculty of Science.
S. Motomizu.
Analytica Chimica Acta, Vol 64, No 2, p 217-224, April 1973. 4 fig, 4 tab, 16 ref.

Descriptors: *Cobalt, *Sea water, *Methodology, *Solvent extractions, *Pollutant identification, *Spectrophotometry, Water analysis, Chemical analysis, Heavy metals, Separation techniques, Hydrogen ion concentration, Ions, *Phenols.
Identifiers: 2-Nitroso-5-diethylaminophenol, Precision, Chemical interference, Reproducibility, Ionic interference, Sample preparation, Reagents, Complexation, EDTA, Absorption spectra, Organic solvents.

A method is described for determining cobalt in seawater spectrophotometrically by 2-nitroso-5-diethylaminophenol after extraction of the complex into 1,2-dichloroethane. This method eliminates preconcentration, requires relatively small volumes of sample solution, and provides simplicity and precision. The procedure was used in studying the effects of pH, shaking time, standing time and amounts of the reagent added on the extraction of cobalt. The optimal pH range was 4.5-8.5 for distilled water containing 0.24 microgram of cobalt, but 5.5-7.5 for sea waters. The minimal shaking time was 6 min in both cases, and a time of 10 min was selected for certainty. The standing time necessary for development of the complex was only 10 min, but a period of 30 min was considered advisable. When distilled water containing 0.24 microgram of cobalt was used, maximal absorbance was obtained with a reagent addition of 10 ml of 0.2 percent solution per liter. Those metal ions that are extracted along with the cobalt complex can be stripped completely with HCl, thus eliminating interference. Other metal ions and anions existing commonly in seawater do not interfere. The method is applicable over the range 0-0.24 microgram Co/l when 1-l or 2-l samples are taken. The relative standard deviation is 4 percent for 0.15 microgram Co/l. The stability of cobalt in sea water samples is discussed. (Holoman-Battelle)

A SIMULTANEOUS DETERMINATION OF LEAD-210 AND POLONIUM-210 IN SEA WATER,
Hokkaido Univ., Hakodate (Japan). Faculty of Fisheries.
Y. Nozaki, and S. Tsunogai.
Analytica Chimica Acta, Vol 64, No 2, p 209-216, April 1973. 6 fig, 2 tab, 7 ref.

Descriptors: *Sea water, *Radiochemical analysis, *Methodology, *Water analysis, Chemical analysis, *Lead radioisotopes, Radioactivity, Chemical precipitation, Heavy metals, Pollutant identification, Pollutants.
Identifiers: Pb-210, Po-210, *Polonium radioisotopes, Sample preparation, Alpha spectrometry, Coprecipitation, Accuracy.

A simpler and more precise method is described for the determination of lead-210 and polonium-210 in seawater. In the proposed method, these nuclides are coprecipitated with calcium carbonate and then polonium is selectively separated from other nuclides by spontaneous deposition onto a silver disc. The content of lead-210 is measured by the activity of its granddaughter, polonium-210, produced during the storage of the sample containing lead-210 for more than 3 months. In the development of this method, particular caution was taken to avoid the adsorption loss of polonium-210 onto the wall of the container used during analysis and storage. Replicate analyses done on about 45-l seawater samples gave a counting error of about plus or minus 10 percent for Po-210 stored for about 5 months. Seawater samples collected from the North Pacific Ocean during the cruise of R/V Hakuho-maru, KH-71-3 in 1971 analyzed by the above procedure showed that the ratios of Po-210 to Pb-210 were smaller than unity in the surface layer of the ocean. A POTASSIUM-SELECTIVE SILICONE--RUBBER MEMBRANE ELECTRODE BASED ON A NEUTRAL CARRIER,
Technical Univ. of Budapest (Hungary). Inst. for General and Analytical Chemistry.
J. Pick, K. Toth, and E. Pungor.
Analytica Chimica Acta, Vol 64, No 3, p 477-480, May 1973. 2 fig, 3 tab, 19 ref.

Descriptors: *Selectivity, *Cations, Aqueous solutions, Alkali metals, *Alkaline earth metals, Potassium, Hydrogen, Sodium, Cesium, Calcium, Strontium, Magnesium.
Identifiers: *Ion selective electrodes, *Membrane electrodes, *Potassium electrodes, Ligands, Valinomycin, *Electrochemical behavior, Electromotive force, Response time, Reproducibility, Ionic interference, Barium, Lithium, Ammonium, Rubidium.

A new potassium-selective silicone-rubber membrane electrode based on the neutral carrier valinomycin has been developed. The electrode selectivity for most alkali and alkaline earth metal cations is comparable to that of the conventional liquid membrane electrodes. Over a period of 65 h no drift in e.m.f. was observed. The response time usually is less than 3 s. (Holoman-Battelle)

THE DETERMINATION OF SELENIUM IN SEA WATER BY GAS CHROMATOGRAPHY WITH ELECTRON-CAPTURE DETECTION,
Okayama Univ. (Japan). Faculty of Science.
Y. Shimoishi.
Analytica Chimica Acta, Vol 64, No 3, p 465-468, May 1973. 2 fig, 1 tab, 7 ref.

Descriptors: *Sea water, *Water analysis, *Methodology, *Gas chromatography, Chemical analysis, Pollutant identification, Pollutants, Solvent extractions, Separation techniques.
Identifiers: *Electron capture gas chromatography, *Selenium, Sample preparation, Detection limits, 4-Nitro-o-phenylenediamine hydrochloride.

A direct gas chromatographic method is described for the determination of selenium in seawater without preconcentration. A volume of seawater and HCl were combined in a separatory funnel to which was added 1 percent 4-nitro-o-phenylenediamine solution. This mixture was allowed to stand for 2 hr and the 5-nitropiaselenol formed was extracted into toluene by shaking for 5 min. The toluene extract was washed with 7.5 M HCl and 5-microliter aliquots were injected into a gas chromatograph equipped with an electron capture detector, and the peak height measured. Seawater samples were prepared for the procedure by membrane filtration and shaking with toluene to extract toluene-soluble material. This caused no loss in Se. Analysis of seawater samples showed an average Se content of 0.04-0.08 plus or minus 00.01 microgram/l. As even about 0.002 microgram of selenium in 1 ml of organic extract can be detected by this procedure, only 50-100 ml of seawater is needed. (Holoman-Battelle)

ION-SELECTIVE CARBON-PASTE ELECTRODES FOR HALIDES AND SILVER (I) IONS,
Technische Hogeschool Twente, Enschede (Netherlands). Dept. of Chemical Technology.
S. Mesaric, and E. A. M. F. Dahmen.
Analytica Chimica Acta, Vol 64, No 3, p 431-438, May 1973. 4 fig, 3 tab, 19 ref.

Descriptors: *Halides, *Cations, *Aqueous solutions, *Fabrication, Silver iodide, Measurement, Heavy metals, Halogens, Volumetric analysis, Chemical analysis, Pollutant identification, Instrumentation, Hydrogen ion concentration.
Identifiers: *Silver, *Ion selective electrodes, *Carbon paste electrodes, Potentiometric titration, Silver chloride, Silver bromide, Potentiometry, Chemical interference, Detection limits, Silver chloride/silver sulfide electrodes, Silver bromide/silver sulfide electrodes, Silver iodide/silver sulfide electrodes.

The behavior of a simple type of ion-selective electrode for halogens and silver has been studied. The electrode consists of a plastic body filled with carbon paste, the surface of which can be easily renewed. The paste composition is based on carbon-nujol (5:1, w/v) or carbon-paraffin wax (3:1, w/w) containing a prepared mixture of silver halide-silver sulphide (1-30 percent). The electrodes have low ohmic resistance and show a rapid Nernstian response (within 2-5 mV) for halide and silver ions down to 0.05 mM chloride, 0.01 mM bromide and 0.5 microM iodide with the respective electrodes. Ions forming very stable complexes with halide or silver and those having strong oxidizing or reducing action interfere. (Holoman-Battelle)

SOME PROCEDURES FOR ISOLATING TOXIC METABOLITES OF PHOSPHOROTHIONATE PESTICIDES FROM ANIMAL TISSUES AND FLUIDS,
Ministry of Agriculture, Fisheries and Food, Weybridge (England). Central Veterinary Lab.
A. F. Machin.
Proceedings of the Society for Analytical Chemistry, Vol 10, No 4, p 92-93, April 1973. 10 ref.

Descriptors: *Phosphothioate pesticides, Methodology, *Chemical analysis, *Isolation, *Diazinon, Organophosphorus pesticides, Insecticides, Gas chromatography, Separation techniques, Pollutant identification, Mass spectrometry, Urine, Pesticide toxicity, Pollutants, *Chromatography.
Identifiers: *Metabolites, *Animal tissues, Body fluids, Thin layer chromatography, Column chromatography, High pressure liquid chromatography, Thiolates, Thermionic gas chromatography, Sensitivity, Thionates

The chromatographic procedures used in separating the metabolites of diazinon, together with some more recent improvements, are discussed. The methods, which include thin-layer, gas-column and high-pressure liquid chromatography, are thought to be generally applicable to metabolites of phosphorothionate pesticides. Thin-layer chromatography is useful both for recognizing toxic metabolites by their inhibition of esterases and for isolating them. Gas chromatography is used extensively for detecting metabolites that contain phosphorus, determining residues and monitoring the progress of purification. A thermionic detector is generally used: its high and selective sensitivity probably makes it more suitable than the specific but less sensitive flame-photometric detector. Gas chromatography is convenient for isolating metabolites in microgram amounts for mass spectrometry, for which purpose an instrument designed especially for the collection of labile compounds is used. It is not satisfactory for purifying the much larger amounts needed for nuclear magnetic resonsance measurements, however, owing to the difficulty of collecting large fractions quantitatively. Column chromatography is tedious but so far has been the only way to separate dehydrodiazinon from the much larger amounts of diazinon and fat which accompany it. High-pressure liquid chromatography is now being used for some of the isolations. Simple equipment, including a pump built at the author's laboratory, is used with a commercial ultraviolet detector. POTENTIOMETRIC STUDIES ON THIOACETAMIDE BY MEANS OF A SULPHIDE ION-SELECTIVE MEMBRANE ELECTRODE,
Technical Univ. of Budapest (Hungary). Inst. for General and Analytical Chemistry.
M. K. Papay, K. Toth, V. Izvekov, and E. Pungor.
Analytica Chimica Acta, Vol 64, No 3, p 409-415, May 1973. 12 fig, 2 ref.

Descriptors: *Chemical analysis, *Aqueous solutions, *Pollutant identification, Inorganic compounds, *Volumetric analysis, Hydrogen ion concentration, Chemical precipitation, Methodology.
Identifiers: *Thioacetamide, *Potentionmetric titration, *Ion selective electrodes, *Sulfide electrodes, Silver nitrate, Ultraviolet spectra, Infrared spectra, Membrane electrodes, Silver sulfide.

The sulphide ion-selective electrode has been found to be applicable to the determination of thioacetamide in the concentration range of 0.1-0.001 M by direct potentiometry and titration with silver nitrate. The effects of the acid and alkali content of the solutions on the titration reaction have been studied. In alkaline and slightly acidic solutions the product of the reaction is silver sulphide; in solutions in which the acid concentration exceeds 0.5 M, a precipitate of silver thioacetamide is formed. If the alkali concentration of the solution is lower than that corresponding to the amount of acid formed during the titration, another potential jump occurs before the endpoint owing to the decrease of sulphide concentration governed by hydrolysis. ATOMIC ABSORPTION INHIBITION TITRATION OF ORTHOPHOSPHATE AND POLYPHOSPHATES,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
W. E. Crawford, C. I. Lin, and C. O. Huber.
Analytica Chimica Acta, Vol 64, No 3, p 387-395, May 1973. 4 fig, 4 tab, 13 ref.

Descriptors: *Aqueous solutions, *Water analysis, *Phosphates, Chemical analysis, *Volumetric analysis, Methodology, Anions, Surface waters, Silicates, Waste water (Pollution), Sulfates, Detergents, Pollutant identification, Water pollution.
Identifiers: *Polyphosphates, *Orthophosphates, *Atomic adsorption spectrophotometry, Total consumption burner, Premix burner, Inhibition titration, Sensitivity, Gas flow rates, Accuracy, Chemical interference, Ionic interference.

The atomic absorption inhibition titration of phosphates was studied for two types of burner. It involves titration of the anion solution with a metal cation solution while the atomic absorption signal for the metal is monitored. Magnesium was selected as the monitor metal because of its sensitivity for measurement and the high extent of inhibition by refractory forming anions. The anions selected in this study are ortho-, pyro-, tetra- and hexaphosphates. Observations were made with both total consumption and pre-mix slot burners. A hydrogen-air flame was used in order to have the relatively low flame temperatures and the flame temperature control which are necessary. The method with a pre-mix burner was used to determine phosphate in surface and waste waters. The results compared quite favorably with those by the standard method. The proposed method was found to be rapid, simple and accurate. A complete manual titration curve was obtained in less than 30 min and semi-automatic titration required less than 5 min. Identifiers: *Hot graphite atomizer, *Atomic absorption spectrophotometry, Preconcentration, p-Aminobenzylcellulose, Chitosan, Chemical interference, Tin, Arsenic, Silver, Diethylaminoethylcellulose, Antimony, Uranyl, Dowex A-1, Dowex -X8, Chelating agents.

A comparative study of the chelating ability of chitosan, p-aminobenzylcellulose and diethylaminoethylcellulose, for a number of metal ions is discussed. There is a strong interaction between molybdenum and these polymers in thiocyanate solutions and in sea water. By combining the sensitivity of graphite-furnace atomic absorption spectrometry with the efficiency of the selective collection of molybdenum on p-aminobenzylcellulose of chitosan at pH 2.5, it was possible to determine molybdenum in as little as 50 mg of sea water. Identifiers: *Polychaetes, *Pelagic animals, *Taxonomic guides, Animal morphology, Sample preservation, Macroinvertebrates, Antinoella spp, Macellicephala spp, Pelagobia longicirrata, Typhloscolex spp, Rhynchonerella spp, Vanadis tagensis, Phalacrophorus spp, Tomopteris spp, Travisiopsis lobifera.

A series of six practical taxonomic guides to zooplankton was prepared to meet the needs of non-taxonomists involved with Arctic fauna. The work is based upon results of research by investigators associated with the USC Arctic Project and its precursors since 1952. This compilation presents a detailed consideration of the different adult pelagic polychaetes found in the central Arctic Ocean. Emphasis has been placed on the familial level as information on the group is still inadequate to justify construction of generalized keys to species. Provided also are a discussion of basic polychaete morphology and terminology used in the guide, illustrations, dichotomous keys, and hints on methodology for handling preserved specimens. Selected references pertaining to polychaetes in general, as well as those concerning specific polychaetes in the guide, are included. (Holoman-Battelle)

Descriptors: *Manganese, *Iron, *Cobalt, *Nickel, *Copper, *Zinc, *Cadmium, *Separation techniques, *Heavy metals, *Chromagraphy.
Identifiers: Reversed phase chromatography, Distribution coefficients, Chromatograms.

A procedure is described for the separation of manganese, iron, cobalt, nickel, copper, zinc and cadmium by means of reversed-phase chromatography. The distribution coefficients of these elements were determined by extraction with tri-n-octylamine-benzene (1:1) solution from hydrochloric acid and hydrochloric acid-nitric acid mixtures. In addition, the influence of particle size, degree of loading of silica gel with tri-n-octylamine, flow-rate and temperature on the height of effective theoretical plate was investigated. A gradient apparatus which was developed for this kind of separation is described; by insertion of circuitous tubes between the mixing vessels and the column head, a concentration gradient can be obtained for the eluent that is partly constant and partly decreased. The phenyl compounds of thallium, selenium, tellurium, mercury, arsenic, antimony, bismuth and tin are suitable for the analysis of these elements by gas chromatography. They are produced quantitatively except thallium triphenyl when the diethyldithiocarbamates, which are extracted out of acid solution, are reacted with magnesium organic compounds. By gas chromatography the phenyl compounds of all eight elements are separated with one column by utilizing a temperature program. In case of mercury diphenyl complete elution could not be realized. APPARATUS FOR SEMI-CONTINUOUS CULTURE OF DAPHNIA,
A. M. Harvey.
Laboratory Practice, Vol 22, No 2, p 114-115, February 1973. 1 fig, 11 ref.

Descriptors: *Daphnia, Sampling, Zooplankton, Laboratory equipment, Crustaceans.
Identifiers: *Chemostat, *Culturing vessels, *Culturing techniques, Macroinvertebrates.

An apparatus for culturing Daphnia, which employs some advantage of the chemostat is described. Two-litre culture vessels with a 14 mm bottom port are used. A delicate agitator is used involving moist, sterile air bubbling through a sintered glass disc into an inverted funnel inside the culture vessel. This provides satisfactory mixing and alleviates localization of metabolic wastes and oxygen deficiency. The vessel is autoclaved at 15 pounds per square inch for 15 minutes, and then joined aseptically to sterile food and air lines in a controlled temperature room at 20C. A suspension of 150,000 cells per ml of Chlorella vulgaris is pumped into the culture vessel to a volume of 1200 ml. Sterile, clonal Daphnia pulex are introduced and the agitation system activated. The culture is allowed to increase and equilibrate for six days, and the pump is switched on again to give the desired dilution rate. Although this apparatus necessarily falls short of a true chemostat in some respects of its design, it represents a much more satisfactory method than previous ones used for culturing Daphnia. The main advantages are of constancy in the environment, simplicity of con-

trol, and physiological uniformity. The methods used to minimize particular problems presented by Daphnia could easily be modified to allow the culture of other aquatic invertebrates in a similar system. (Mortland-Battelle)

ANALYSIS OF ORGANIC CONSTITUENTS PRESENT IN DRINKING WATER,
Vysoka Skola Chemicko-Technologicka, Prague (Czechoslovakia). Dept. of Petroleum Technology and Petrochemistry.
J. Novak, J. Zluticky, V. Kubelka, and J. Mostecky.
Journal of Chromatography, Vol 76, p 45-50, February 7, 1973. 3 fig, 2 tab, 10 ref.

Descriptors: *Separation techniques, *Organic compounds, *Potable water, Gas chromatography, Mass spectrometry, Water analysis, Solvent extractions.
Identifiers: *GC-Mass spectometry, Detection limits, *Organic solvents, *Inert gases, *Gas bubbling, Pentene, Cyclopentane, Cyclopentene, Cyclohexane, Methylcyclopentane, Cyclopentadiene, Cyclohexene, Isobutanal, Tetrachloromethane, Benzene, Trichloromethylene, Chloroform, Tetrachlorethylene, Toluene, Dichloroethane, Xylene, Chlorinated hydrocarbons, Chromatograms.

Polluted drinking water was extracted with carbon tetrachloride or nitrobenzene and the extracts were analyzed by GC-mass spectrometry. The UV and IR spectra were also recorded. A further extraction procedure consisted of bubbling an inert gas (helium) through the water and analyzing by GC-MS. The carbon tetrachloride and nitrobenzene extracts did not reveal the presence of any organic compounds; however, when the inert gas was bubbled through the water, several organic compounds were detected. These were C1-C4 hydrocarbons, pentene, cyclopentane, cyclopene, and methylcyclopentane, cyclopentadiene, cyclohexane, cyclohexene, isobutanal, tetrachloromethane, benzene, trichloromethylene, chloroform, tetrachloroethylene, toluene, dichloroethane, and xylene. Although the source of the compounds was not determined, it was concluded that the limit of detection with bubbling inert gas through the sample is two to three orders higher than with extraction by organic solvents. One limitation of the method is that substances which boil above 100C cannot be determined. (Little-Battelle)

MASS SPECTROMETRIC DETERMINATION OF DIETHYLDITHIOCARBAMATES,
Colorado State Univ., Fort Collins. Dept. of Chemistry.
B. C. Wood, and R. K. Skogerboe.
Applied Spectroscopy, Vol 27, No 1, p 10-12, January/February 1973. 2 fig, 23 ref.

Descriptors: *Heavy metals, *Mass spectrometry, Methodology, Aqueous solutions, *Pollutant identification, Chemical analysis, Cadmium, Copper, Lead, Zinc, Solvent extractions, Chelation, *Carbamate pesticides.
Identifiers: *Metal chelates, *Diethyldithiocarbamates, Direct insertion probe, Sample preparation, Organic solvents, Arsenic, Reproducibility, Mass spectra, Detection limits, Accuracy.

The determination of diethyldithiocarbamate chelates of As, Cd, Cu, Pb, and Ln by direct insertion probe mass spectrometry is reported. Extractions directly into the diethylammonium diethyldithiocarbamate-methyl isobutyl ketone (DADDC-MIBK) solutions were carried out at the appropriate pH by the procedures outlined by Joyner and Finley (1966), Nix and Goodwin (1970), and Trujillo (1971). The extracts were stored in clean vials from which microliter quantities were delivered to the quartz sample holder of the direct insertion probe. The measurements made on the above elements were generally reproducible to plus or minus 10 percent. Assuming an instrument blank of 1 ng, each of these elements can be determined at levels ranging from 0.5 to 1 ng via this technique. Such determination capabilities are equivalent to 0.01 ppm in a 10-ml aqueous sample extracted into 1 ml of MIBK using a 10-microliter sample of the extract for the analysis. (Holoman-Battelle)

MICROMETHOD SYSTEM FOR IDENTIFICATION OF ANAEROBIC BACTERIA,
Center for Disease Control, Atlanta, Ga. Lab. Div.
S. E. Starr, F. S. Thompson, V. R. Dowell, Jr., and A. Balows.
Applied Microbiology, Vol 25, No 5, p 713-717, May 1973. 3 tab, 8 ref.

Descriptors: *Anaerobic bacteria, *Pollutant identification, *Methodology, Chemical reactions, Reduction (Chemical), Cultures, Nitrates, Nitrites, Hydrolysis, Ureas, Fermentation, Hydrogen sulfide, Carbohydrates, Laboratory tests, Speciation.
Identifiers: *Micromethod system, *Method evaluation, *Comparative tests, Culture media, Substrate utilization, Biochemical tests, Bacterial physiology, Gas liquid chromatography, Indoles, Nutrient media, Substrates, Ehrlich reagent, Kovac reagent, Blood agars, Bacterioides spp, Clostridium spp, Fusobacterium spp, Lactobacillus catenaforme, Propionibacterium acnes, Propionibacterium granulosum, Glucose, Mannose, Mannitol, Lactose, Sucrose, Maltose, Salicin, Glycerol, Xylose, Arabinose, Starch, Esculin, Gelatin, Fusobacterium necrophorum, Peptostreptococcus, Bifidobacterium, Eubacterium lentum, Peptococcus.

A micromethod multitest system was compared with conventional tests for identification of anaerobic bacteria. The micromethod system includes tests for neutral red and nitrate reduction; H2S, urease, and indole production; hydrolysis of gelatin and esculin; and fermentation of glucose, mannose, fructose, galactose, mannitol, lactose, sucrose, maltose, salicin, glycerol, xylose, arabinose, and starch. All procedures were conducted in an anaerobic glove box. A total of 104 cultures, including 18 reference strains and 86 diagnostic cultures, were examined. Ninety-one percent of the total tests performed with the two systems were in agreement. Greater than 90 percent agreement between the two systems was obtained with 12 of the 17 differential tests compared. The tests for nitrate reduction and H2S production gave the poorest agreement, 77.8 and 80.8 percent, respectively. Only 66 percent of the 86 diagnostic cultures could be presumptively identified with the micromethod system supplemented only with microscopy and colonial characteristics. However, when appropriate supplementary tests and gas-liquid chromatography were used with the micromethod system, 85 percent of the 86 strains could be identified. When Ehrlich reagent, instead of Kovac reagent, was used with the micromethod to test for indole, the agreement in identification was raised to 93 percent. (Mortland-Battelle)

FRITTED DISC FUNNELS AND TAPERED STAINLESS STEEL TUBES AND STOPPERS FOR USE IN PESTICIDE RESIDUE ANALYSIS,
Canadian Grain Commission, Winnipeg (Manitoba). Grain Research Lab.
I. Levi, and T. W. Nowicki.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 1, p 20-23, January 1973. 2 fig, 1 ref.

Descriptors: *Pesticide residues, *Filtration, Laboratory equipment, *Filters, *Tubes, Mechanical equipment, Gas chromatography, Separation techniques, Crops, Wheat, Barley
Identifiers: Chemical interference, Sample preparation, Funnels, *Gas liquid chromatography, Biological samples, Fritted discs.

Teflon and other gaskets in blender-extractor apparatus and filter papers give rise to interfering GLC peaks during analysis of pesticide residues in wheat and barley. Two pieces of equipment were developed to avoid these problems. The first was a fritted disc funnel for filtering residue extractions. It consists of a pyrex funnel fitted with a 50 mm diameter medium porosity fritted disc which is annealed to the funnel. The funnel requires suction. The second piece of equipment is a stainless steel tapered tube and stopper assembly which requires no gaskets. Schematic drawings of the tube and stopper are included. (Little-Battelle)

EFFECTS OF FIXATION ON THE EXTRACTION OF DIELDRIN AND P,P'-DDT FROM MUSCLE TISSUE,
Massachusetts Univ., East Wareham. Lab. of Experimental Biology.
K. H. Deubert, J. S. Timmerman, and L. R. McCloskey.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 1, p 54-56, January 1973. 1 tab, 3 ref.

Descriptors: *Separation techniques, *Freshwater fish, *Marine fish, *Dieldrin, *DDT, *Pesticide residues, Brook trout, Smelts.
Identifiers: *Sample preservation, Formalin, Biological samples, Fixation, *Muscle, Bouin's fixative, p p'DDT, Cod (Fish), Animal tissues.

Samples of muscle tissue were taken from codfish, smelt, and brook trout and fixed in formalin or Bouin's fixative to study the effect of fixation on extraction of dieldrin and p,p'-DDT. Frozen samples were used for reference. The results indicate that the use of formalin or Bouin's mixture does not affect the extractability of p,p'-DDT and dieldrin at the low levels occurring in environmental samples. As well, the results indicate that tissue samples fixed in Bouin's solution for histological studies can still be used for dieldrin and DDT analysis. (Little-Battelle)

RESIDUES OF DDT IN COD FROM NORWEGIAN FJORDS,
Norges Veterinarhoegskole, Oslo. Dept. of Pharmacology and Toxicology.
J. E. Bjerk.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 2, p 89-97, February 1973. 1 fig, 3 tab, 16 ref.

Descriptors: *Gas chromatography, *Pesticide residues, *DDT, Water pollution sources, *Lipids, Separation techniques, Runoff, DDD, DDE, Water pollution effects, Growth rates, Size, Absorption, Orchards, Path of pollutants, Water pollution effects, Marine fish.
Identifiers: *Liver, *Muscle, *Cod (Fish), Biological samples, o p'DDT, p p' DDT, Gadus morhua, Sample preparation, Norway.

Samples of cod from four fiords located at the south-western coast of Norway were analyzed for DDT residues by GC. At locality A there were large fruit orchards and a small forest nursery. At C there were fruit orchards, while at B there was a forest nursery only. The fourth locality, D, had no known source of contamination. At A samples were collected at intervals during the spring of 1970. The DDT content in cod liver in samples from A and C was high. The mean values of 10-15 specimens ranged between 12 and 40 ppm, calcu-

ted on a wet weight basis, and between 26 and 99 pm, calculated on the basis of extractable lipids. hree specimens of cod showed residue levels of 0-135 ppm DDT in liver tissue. DDT values in cod om the two other localities were less than 5 ppm. he specimens from A were caught at three sub- calities, and it was found that DDT levels ecreased with increased distance from the head the fiord, where the majority of fruit orchards ere located. Significant correlations were found tween fish size and DDT content in liver tissue, t not in the sample from locality D. The correla- ns were destroyed during the spring breakup, e DDT content increasing during this period. p'-DDT was also found in samples taken during ay and June. The high DDT levels were at- buted to the runoff from fruit orchards located steep slopes in this mountainous area. (Little- ttelle)

RECISE SHIPBOARD DETERMINATION OF ISSOLVED NITROGEN, OXYGEN, ARGON, ND TOTAL INORGANIC CARBON BY GAS HROMATOGRAPHY,
stitution of Oceanography, La Jolla, Calif.
F. Weiss, and H. Craig.
eep-Sea Research and Oceanographic Abstracts, ol 20, No 4, p 291-303, April 1973. 5 fig, 25 ref.

Descriptors: *Dissolved oxygen, *Gas chromatography, *Sea water, *Chemical analysis, Water analysis, Instrumentation, Calibrations, Methodology, Pollutant identification, On-site data collections, On-site investigations, *Nitrogen, *Carbon, *Argon.
Identifiers: *Shipboard measurements, Dissolved nitrogen, Dissolved carbon, Dissolved argon, On board analysis, Dissolved gases, Thermal conductivity gas chromatography, Precision, Accuracy, Winkler method.

A seagoing gas chromatographic system for the rapid and precise determination of dissolved gases in sea water is described. Separate instruments are employed for total inorganic carbon, and for nitrogen, oxygen, and argon analyses. Factors affecting the design, calibration, and shipboard operation of the system are discussed in detail. Results of intercomparisons with other analytical techniques confirm the accuracy of the gas chromatographic method. Profiles of sigma CO2, 02, and N2 measured aboard ship are presented and discussed. (Holoman-Battelle)

HYDROCARBONS FROM SEA WATER,
Centre National de la Recherche Scientifique, Paris (France).
M. Barbier, D. Joly, A. Saliot, and D. Tourres.
Deep-Sea Research and Oceanographic Abstracts, Vol 20, No 4, p 305-314, April 1973. 9 fig, 2 tab, 16 ref.

Descriptors: *Sea water, *Mass spectrometry, *Water analysis, Chemical analysis, *X-ray fluorescence, *Pollutant identification, Atlantic Ocean, Organic matter, *Organic compounds, Sampling, Isolation, Solvent extractions, Separation techniques, Friction.
Identifiers: *Dissolved organic matter, *Gas liquid chromatography, n-Paraffins, Coastal waters, Fatty acids, Sterols, Mass spectra, Sample preparation, Chlorinated hydrocarbons, Hexachlorocyclohexane, Hexachlorodiphenyl.

Dissolved hydrocarbons have been extracted by means of chloroform, from coastal and open sea waters; after isolation of the unsaponifiable fraction and preparative thin-layer chromatography, they were analyzed by gas-liquid chromatography and mass spectrometry. Hydrocarbons represent ca 20 percent of the total extracts; concentrations may vary from 10 to 140 micrograms 1. N-Paraffins occur to an extent of ca 12 percent, from n-C14 to n-C37, with a maximum at n-C27 to n-C30; odd carbon paraffins are not predominant. Sea waters of different origins (collected at depths of as much as 4500 metres) show a similar composition in dissolved hydrocarbons; this composition does not differ much from the hydrocarbons usually found in algae. A probable hypothesis is that sea-water hydrocarbons originate from the micro-or macro phytoplankton. Coastal waters clearly indicate pollution by hydrocarbons of lower molecular weight or chlorinated hydrocarbons. (Holoman-Battelle)

RESIDUE DETERMINATION OF ETHYLENETHIOUREA (2- -IMIDAZOLIDINETHIONE) FROM TOMATO FOLIAGE, SOIL, AND WATER,
Agricultural Research Center, Immokalee, Fla.
C. H. Blazquez.
Journal of Agricultural and Food Chemistry, Vol 21, No 3, p 330-332, May/June 1973. 3 tab, 18 ref.

Descriptors: *Pesticide residues, *Soil contamination, Water pollution, *Foliar, *Bioassay, *Pollutant identification, Chemical analysis, Tomatoes, Plant tissues, Urea pesticides, Water analysis, Soil analysis, Separation techniques, Carbamate pesticides, Thiocarbamate pesticides, Metal organic pesticides, Ditches.
Identifiers: *Ethylenethiourea, Detection limits, Thin layer chromatography, Maneb, Zineb, Dithane M-45, Sample preparation, Sensitivity, 2-Imidazolidinethione, Ethylenethiuram monosulfide, Ethylenediamine, Solvent extraction systems, Alternaria solani, Dithane Z-78, Dithane M-22.

A thin-layer chromatographic method was developed for the analysis of ethylenethiourea (ETU) (2-imidazolidinethione) from tomato foliage, soil, and water. High yields of ETU were obtained when heat was applied during the evaporation of dioxane-water suspensions of the fungicides ethylenethiuram monosulfide (ETM) and ethylenebisdithiocarbamate (Dithane M-45). Investigations indicate that no ETU was detected from Dithane M-45 applications on tomato foliage, soil surface, or ditch water. The tlc method had a sensitivity of 1 ppm, which is adequate in residue analysis experiments. ETU was detected as low as 1 ppm with the tlc method, a concentration adequate in field investigations of the degradation of ethylenebisdithiocarbamate fungicide residues and their biological activity. The tlc method coupled with a bioassay technique fit well into residue monitoring (RM) method of the EWDC system for more efficient timing of pesticide applications. (Holoman-Battelle)

ATOMIC FLUORESCENCE SPECTROMETRY WITH A GRAPHITE ROD ATOMIZER AND THERMOSTATED ELECTRODELESS DISCHARGE LAMPS,
Florida Univ., Gainesville. Dept. of Chemistry.
B. M. Patel, R. D. Reeves, R. F. Browner, C. J. Molnar, and J. D. Winefordner.
Applied Spectroscopy, Vol 27, No 3, p 171-176, May/June 1973. 3 fig, 4 tab, 35 ref.

Descriptors: *Heavy metals, *Aqueous solutions, Cadmium, Copper, Mercury, Lead, Zinc, Chemical analysis, Methodology.
Identifiers: *Atomic fluorescence spectroscopy, *Multielemental analysis, *Graphite rod atomizer, *Electrodeless discharge lamps, *Oil-based solutions, Detection limits, Tin, Thallium, Organometallics.

Atomic fluorescence investigations with a graphite rod atomizer and thermostated multiple element electrodeless discharge lamps (EDL's) are reported for Ag, Cd, Cu, Hg, Pb, Sn, Tl, and Zn. Detection limits in the range 0.1 ng to 0.01 pg have been obtained for these elements using a sample volume of 0.5 microliter. The detection limits are better than, or close to, the lowest reported values obtained by other workers using atomic spectrometric methods. No spectral or chemical interferences have been observed when using multiple element EDL's or standard multielement solutions. The atomic fluorescence signal obtained using argon and argon-hydrogen atomospheres has been studied as a function of the gas flow rates and as a function of height above the graphite rod atomizer. Except for Hg, better fluorescence signals are obtained with argon-hydrogen. (Holoman-Battelle)

GAS-LIQUID CHROMATOGRAPHIC SEPARATION OF SULFUR FROM CHLORINATED PESTICIDE RESIDUES IN WASTEWATER SAMPLES,
Los Angeles County Sanitation Districts, Whittier, Calif.
R. B. Baird, L. G. Carmona, and C. L. Kuo.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 2, p 108-115, February 1973. 4 fig, 8 ref.

Descriptors: *Water analysis, Waste water (Pollution), *Sediments, *Sulfur compounds, *Separation techniques, *Chlorinated hydrocarbon pesticides, DDT, DDD, Endrin, Dieldrin, DDE, Aldrin, Heptachlor, Sulfur, Insecticides, Pesticide residues.
Identifiers: Chemical interference, *Gas liquid chromatography, *Column packing, Heptachlor epoxide, Lindane, BHC, Columns, Column cleanup, p p'DDT, p p'DDD, o p'DDT, o p'DDD, p p'DDE, o p'DDE.

Sulfur interference in the GC analysis of chlorinated pesticides was eliminated by the addition of 1.0 percent DC-200 to the column packing of 4.4 percent OV-17 and 4.7 percent QF-1 on 80/100 mesh Gas-Chrom Q solid support. Samples of 13 chlorinated pesticides were analyzed with the column. The effect of the DC-200 addition was to shift the major interfering sulfur peak between those of o,p'-DDE and p'p'-DDE, thus eliminating the sulfur interference with the analysis of these compounds without diminishing the resolution of the remaining pesticides of interest. Routine use of this mixed column demonstrated that satisfactory analysis of sulfur-containing wastewaters and sediments may be performed without lengthy chemical desulfurization or extraction of large quantities of sample followed by detection with a highly selective detector. The development of biochemical-specific electrode system is discussed; some of the foreseeable problems that might be associated with their use are presented; and the essential literature is reviewed. It was determined that the clinical determinations of certain metabolites and soluble enzymes by means of enzyme electrodes are quite feasible. Such devices may be made highly specific by the use of appropriate enzymes and a high degree of accuracy can be obtained. Instantaneous and continuous determinations can be made from physiological fluids, and undesirable physiologic responses can theoretically be minimized, thus making long-term clinical monitoring a possibility. Enzyme electrodes may also have a useful lifetime and meet other practical requirements. (Holoman-Battelle)

Identifiers: *Biological samples, *Trace levels, Ion exchange resins, Detection limits, Blood serum, Errors, Organomercury compounds, Organometallics, Body fluids, Natural waters, Sample preparation.

A wet digestion has been developed to prepare water and biological samples for a kinetic determination of mercury using an iodide-catalyzed reaction between cerium (IV) and arsenite (III). A mercury-free control, prepared using ion-exchange with a selective chelating resin, was used by adding mercury standards to make a calibration curve. Both inorganic and organic mercury can be determined by the method described either in water or biological samples containing mercury in the range of 0.05 to 2.0 micrograms per ml. The procedure can be used satisfactorily down to the 0.005-ppm level for fresh water and urine with an overall error of less than 5 percent. The method can also be employed for the determination of mercury in sea water or blood serum with an error of 10 percent or less and gives results which compare favorably with other procedures. DISTORTION OF MIREX RESIDUES IN INSECTS OWING TO USE OF ISOPROPYL ALCOHOL AS A COLLECTION SOLVENT,
Agricultural Research Service, Gainesville, Fla. Insects Affecting Man and Animals Research Lab.
D. A. Carlson, W. A. Banks, and D. P. Wojcik.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 6, p 365-369, June 1973. 3 tab, 3 ref.

Descriptors: *Pesticide residues, *Pollutant identification, *Insects, Chlorinated hydrocarbon pesticides, Chemical analysis, Storage, Insecticides, Solvent extractions, Separation techniques.
Identifiers: *Mirex, *Isopropyl alcohol, Sample preservation, *Sample preparation, Organic solvents, Solenopsis invicta, Blattella germanica, Electron capture gas chromatography.

Collection or storage of insects in 70 percent isopropyl alcohol (IPA) was found to cause loss of body weight, major loss of nonpolar insecticides from submerged specimens, and transfer of insecticide to previously uncontaminated specimens. These effects may by no means be limited to mirex, since any chlorinated hydrocarbon is relatively lipophilic and may behave similarly. Residues reported for treated insects that have been collected or stored in alcohol may have been reduced to 12 percent of the original value. Moreover, small untreated vertebrates and invertebrates trapped in alcohol with insecticide-laden insects are likely to absorb significant amounts of insecticide from the solution. (Holoman-Battelle)

ATOMIC ABSORPTION SPECTROMETRY OF TRACES OF TRI- AND HEXAVALENT CHROMIUM,
Nagoya Univ. (Japan). Dept. of Synthetic Chemistry.
M. Yanagisawa, M. Suzuki, and T. Takeuchi.
Mikrochimica Acta, No 3, p 475-480, 1973. 3 fig, 1 tab, 1 ref.

Descriptors: *Pollutant identification, *Chemical analysis, Methodology, *Aqueous solutions, *Chromium, Hydrogen ion concentration, Solvent extractions, Chelation, Heavy metals, Pollutants, Cations.
Identifiers: *Trace levels, *Atomic absorption spectrophotometry, Metal chelates, Reproducibility, Sodium diethyldithiocarbamate, 8-Hydroxyquinoline, Thenoyltrifluoracetone.

Atomic absorption spectrometry combined with extraction has been shown to be a rapid and precise method (reproducibility of plus or minus 1 to approximately 2 percent for 5 determinations) for the determination of traces of tri- and hexavalent chromium. The chromium diethyldithiocarbamate chelate was used for chromium (VI), whereas hydroxyquinolate or thenoyltrifluoracetonate chelate for chromium (III). A series of solutions in the range of pH 2 to approximately 8 was prepared and investigated to confirm the optimum pH range for extraction of chromium chelates. The optimum pH range for quantitative extraction of chromium chelates is 5 to approximately 7. Two extractions were necessary for complete extraction of the chromium hydroxyquinolate. Acetate buffer was suitable for the extraction of the chromium chelate, in contrast to poor extraction results in a phosphate buffer. Fe, Cu, Al, V, and Mo did not interfere with Cr absorption. The optimum flame conditions were: flow rate of air, 6 l/min; flow rate of acetylene, 2 l/min; beam height, 10 mm above burner top. (Holoman-Battelle)

entifiers: *Ion selective electrodes, *Chemical eference, Chalcogenide glass electrode.

on-doped chalcogenide glass electrodes were ed to investigate potential interferences during alysis of sulfate ions in natural waters of high lfate content. The method was based on barium lfate precipitation. Test solutions were prepared which Ca, K, and Mg were added as interfering ns. Samples of waste water, brackish water, and a water were also analyzed. A Ag/AgCl elec-ode was used as reference in the analyses. The sulting difficulties introduced by the ions con-idered were essentially the same as in all barium lfate methods. Sodium ion and chloride ion at a ndredfold excess caused no problems. Potassi-n ion interfered at this concentration level via precipitation; 94 percent recovery was obtained r 0.02 m sulfate ion in 0.1 M KCl. Magnesium d calcium distort the end point because of simul-aeous complexation with sulfate ion; this does t cause a major problem with the titration chnique. Although calcium also coprecipitates, s effect is sufficiently reproducible to allow for rrection if the Ca content is known. At high lfate concentrations the sample can be diluted to nimize interference. (Little-Battelle)

scriptors: *Zinc, *Aqueous solutions, Iron, avy metals.
entifiers: *Chemical interference, *Atomic ab-rption spectrophotometry, Errors, Accuracy.

ueous solutions were prepared for atomic ab-rption spectrometry by dissolving iron spong in Cl, drying, and dissolving in distilled water. ese solutions were used to demonstrate that n solutions, completely free of zinc, absorbed he zinc resonance line. Iron was extracted from mples of the solution for analysis of zinc. Ab-rption curves showed that the determination of v levels taken to remove iron from the samples or to analysis. Solutions which contain between to 2.0 percent iron will be erroneously high by and 13 micrograms/g Zn, respectively. It is sug-ted that existing analyses of zinc on ferrous terials should be approached with caution. (Lit-Battelle)

IELOMETRIC TITRATIONS OF METAL CA-ONS USING THE TUNGSTEN BRONZE ECTRODE,
es Lab., Iowa.
A. Wechter, P. B. Hahn, G. M. Ebert, P. R. ntoya, and A. F. Voigt.
alytical Chemistry, Vol 45, No 7, p 1267-1269, ne 1973. 3 fig, 1 tab, 6 ref.

scriptors: *Volumetric analysis, Aluminum, c, Copper, Iron, Calcium, Magnesium, Heavy tals, Aqueous solutions, Electrodes, *Alkaline th metals, *Metals, *Cations.
Identifiers: *Tungsten bronze electrodes, *Ion selective electrodes, Sample preparation, Chemical interference.

Tungsten bronze electrodes were used with saturated calomel electrodes in the potentiometric titration of solutions of Al (III), Zn (II), Cu (II), Fe (III), Ca (II), and Mg (II). Solutions were prepared by dissolving Al, Zn, and Cu in HN03 and diluting and by dissolving salts of the remaining elements. Solutions were buffered with NH3/NH4C1 or NH4N03 and titrated with EDTA. There was excellent agreement between calculated and observed values. Oxygen in the solutions did not interfere in the titrations. In order to perform a successful metal ion titration, only one of the following criteria need be met: the metal ion be titrable in basic solution either directly or indirectly, the ion be easily reducible directly at the electrode surface, or a metal redox couple be present which undergoes a change in concentration ratio at the end point. (Little-Battelle)

DETERMINATION OF TRACES OF THALLIUM IN URINE BY ANODIC STRIPPING AC VOLTAMMETRY,
Universidad Nacional de Rosario (Argentina). Faculty of Biochemical Sciences.
D. I. Levit.
Analytical Chemistry, Vol 45, No 7, p 1291-1292, June 1973. 1 fig, 1 tab, 10 ref.

Descriptors: *Urine, Lead, Dissolved oxygen.
Identifiers: *Thallium, *Chemical interference, *Anodic stripping voltammetry, Sample preparation, Albumin, Reproducibility.

The purpose was to apply the ac anodic stripping voltammetry technique with the hanging mercury drop electrode (HMDE) in a body fluid urine in order to determine, rapidly and directly, traces of thallium by measuring the current peak which results from the fundamental hermonic as stripping voltammogram record. The behavior of thallium was examined, and the presence of interferences such as lead, dissolved oxygen, organic compounds, and other complications that effect the electrode process by adsorption were minimized under the selected conditions of experimentation. The sensitivity of the method was improved by a low background current and was reproducible within 2.5 percent for 0.05 ppm thallium in urine. The Tl (I) wave had a symmetrical shape, and its ac peak was a linear function of the concentration in the micromolar range without interference from overlapping waves. Pre-treatment by dilution, cell exchange, use of complexing agents, degasification, and foaming were not required. (Little-Battelle)

DETERMINATION OF NITROGEN-15 BY CHEMICAL IONIZATION MASS SPECTROMETRY,
Rockefeller Univ., New York.
C. V. Lundeen, A. S. Viscomi, and F. H. Field.
Analytical Chemistry, Vol 45, No 7, p 1288-1290, June 1973. 1 fig, 2 tab, 8 ref.

Descriptors: *Mass spectrometry, *Nitrogen, Digestion, Radioisotopes, Ammonia.
Identifiers: *Sample preparation, *N-15, Biological samples, N-14, Acid digestion, *Chemical ionization mass spectrometry.

A technique is presented for determining N-15 using isobutane chemical ionization mass spectrometry. The method is based on the fact that ammonia is easily protonated by the tert-butyl ion in isobutane chemical ionization mass spectrometry to produce the NH4 (plus) ion, but water is not protonated to produce the H30 (plus) ion. Consequently, the relative amounts of N-15 and N-14 in ammonia containing both of these isotopes are obtained from the intensities of the m/e 18 and 19 ions produced where ammonia is introduced into the mass spectrometer. The ammonia to be measured is produced from the original nitrogenous material by acid digestion and is absorbed on solid stearic acid. The stearic acid is placed in the solids introduction probe and heated to release the ammonia. (Little-Battelle)

CHROMATOGRAPHY OF 48 METAL IONS ON STANNIC ARSENATE AND PLAIN PAPERS IN BUTANOL-NITRIC ACID MEDIA,
Z. H. Coll. of Engineering and Technology, Aligarh (India).
M. Qureshi, and S. D. Sharma.
Analytical Chemistry, Vol 45, No 7, p 1283-1288, June 1973. 5 fig, 5 tab, 10 ref.

Descriptors: *Metals, *Separation techniques, *Ion exchange, Lead, Potassium, Copper, Calcium, Zinc, Manganese, Cobalt, Nickel, Mercury, Cadmium, Beryllium, Magnesium, Iron, Aluminum, Chromium, Ceium, Gold, Titanium, Molybdenum, Ions, Strontium.
Identifiers: *Paper chromatography, Silver, Rubidium, Cerium, Palladium, Barium, Samarium, Praseodymium, Neodymium, Indium, Gallium, Lanthanum, Yttrium, Bismuth, Antimony, Ruthenium, Iridium, Thorium, Hafnium, Columbium, Tungsten, Platinum, Thallium, Organic solvents, Uranyl, Vanadyl.

The chromatography of 48 metal ions was systematically studied in butanol-HNO3 systems on plain and ion exchange papers. Solutions were prepared of K, Rb, Cs, Cu, Ca, Pd, Zn, Mn, Co, Ni, Hg, Cd, Ba, Sr, Be, Mg, Pb, Uo2, Fe (II), VO, Sm, Pr, Nd, Fe (III), In, Ga, La, Y, Al, Cr, Ce (III), Bi, Sb, Au, Ru, Ir, Th, Hf, Ti, Ce (IV), Cb, Mo, W, Pt, Ag, and Tl and spotted on the papers. Separations are given on the basis of R sub F values. In addition, the Ksub sp of the arsenates of K, Rb, Cs, Tl, Y, La, Ga, and Ce were predicted on the basis of the R sub F values. GAS CHROMATOGRAPHIC DETERMINATION OF RESIDUES OF METHYLCARBAMATE INSECTICIDES IN CROPS AS THEIR 2,4--DINITROPHENYL ETHER DERIVATIVES,
Agricultural Research Service, Beltsville, Md.
E. R. Holden.
Journal of the Association of Official Analytical Chemists, Vol 56, No 3, p 713-717, May 1973. 5 fig, 3 tab, 3 ref.

Descriptors: *Separation techniques, *Gas chromatography, *Plant tissues, Pesticide residues, Crops, Carbamate pesticides, Asparagus, Carrots, Lettuce, Tomatoes.
Identifiers: *Sample preparation, *Detection limits, *Methylcarbamate pesticides, Aminocarb, Bay 32651, Bay 78537, Bux, Carbanolate, Carbaryl, Carbofuran, Ciba C-9643, Decarbofuran, Hercules 5727, Hercules 9007, Landrin, Mesurol, Mexacarbate, Mobam, Promecarb, Propoxur, Biological samples, Kale, Chromatograms, Cucumbers, Eggplant, Green beans, Spinach, Squash, Organic solvents, Recovery.

A general procedure was developed for determining methylcarbamates in plant materials. The pesticides investigated were Aminocarb, Bay 32651, Bay 78537, Bux, Carbanolate, Carbaryl, Carbofuran, Ciba Cl9643, Decarbofuran, Hercules 5727, Hercules 9007, Landrin, Mesurol, Mexacarbate, Mobam, Promecarb, and Propoxur. The residue was extracted from crop material with acetonitrile, and the extractive purified by partitioning with petroleum ether and coagulating with phosphoric acid-ammonium chloride solution. Phenolic impurities were largely eliminated by partitioning a methylene chloride extract with 0.1 N potassium hydroxide. Carbamate residues were then treated with 1-fluoro-2,4-dinitrobenzene to

form the ether derivative without a prior hydrolysis step. Efficiency in the conversion of the phenolic moieties to the phenyl ethers was essentially 100 percent, thus providing for good reproducibility. Residues were determined at levels as low as 0.05 ppm. Recoveries generally ranged between 90 and 110 percent. (Little-Battelle)

COLLABORATIVE STUDY OF THE NONAQUEOUS COPPER COLORIMETRIC AND SILVER TITRIMETRIC METHODS FOR THE DETERMINATION OF MALATHION IN TECHNICAL GRADE MALATHION AND IN MALATHION FORMULATION,
American Cyanamid Co., Princeton, N.J.
R. S. Wayne.
Journal of the Association of Official Analytical Chemists, Vol 56, No 3, p 579-585, May 1973. 4 fig, 7 tab, 8 ref.

Descriptors: *Methodology, *Chemical analysis, Reliability, Volumetric analysis, Gas chromatography, Testing procedures, Evaluation.
Identifiers: *Collaborative studies, *Method evaluation, *Comparative tests, Standard methods, Coefficient of variation, Interlaboratory tests, *Malathion, Gas liquid chromatography, Copper colorimetry, Silver titrimetry.

The nonaqueous copper colorimetric and the silver titrimetric methods for the determination of malathion were studied collaboratively. The study involved wettable powders, emulsifiable concentrates, dusts, and the technical grade product. The mean of all of the results indicates that both procedures will give comparable values for each sample type used in the study. Agreement between replicates in individual laboratories was excellent. Agreement between laboratories was satisfactory; coefficients of variation ranged from 1.3 to 4.8 percent for the sample studied. The 2 methods offer improved reliability and ease of operation when compared to the official first action colorimetric method, 6.265-6.269. The methods have been adopted as official first action. (Mortland-Battelle)

AN ISOLATION AND CLEANUP PROCEDURE FOR LOW LEVELS OF ORGANOCHLORINE PESTICIDE RESIDUES IN FATS AND OILS,
Food and Drug Administration, Washington, D.C. Div. of Chemistry and Physics.
M. L. Porter, and J. A. Burke.
Journal of the Association of Official Analytical Chemists, Vol 56, No 3, p 733-738, May 1973. 3 fig, 3 tab, 9 ref.

Descriptors: *Oil, *Chlorinated hydrocarbon pesticides, *Lipids, *Polychlorinated biphenyls, DDE, DDD, DDT, Dieldrin, Aroclors, Separation techniques, *Pesticide residues.
Identifiers: *Cleanup, Lindane, Mirex, Heptachlor epoxide, Endosulfan I, Endosulfan II, Endosulfan sulfate, Aroclor 1254, Vegetable oil, Fish oil, Animal oils, Recovery, Detection limits, Chromatograms.

An isolation and cleanup is described for low levels of organochlorine residues (about 0.005 ppm) in fats and oils, prior to electron capture gas-liquid chromatography, Corn oil, butterfat, cold liver oil, chicken fat, and several dietary composites were used in the analyses for lindane, DDE, TDE, DDT, Mirex, heptachlor epoxide, endosulfan I and II, dieldrin, endosulfan sulfate, and Aroclor 1254. The fat or oil was distributed on a column of unactivated Floriisil and the residues partitioned into an eluant of 10 percent water in acetonitrile. Florisil column chromatography with an elution solvent system comprised of mixtures of methylene choride, acetonitrile, and hexane was used for the final cleanup. Extracts prepared in this manner were sufficiently free of fatty extractives to permit injection of the equivalent of 50-60 mg fat sample for GLC. The procedure should be especially useful in determination of low levels of organochlorine pesticide residues in the fat of certain dietary composites. (Little-Battelle)

MICRO AND SEMIMICRO DETERMINATION OF THIOLS WITH ION-SELECTIVE ELECTRODES,
California Univ., Livermore. Lawrence Livermore Lab.
W. Selig.
Mikrochimica Acta, No 3, p 453-466, 1973. 3 fig, 4 tab, 21 ref.

Descriptors: *Sulfur compounds, *Pollutant identification, *Methodology, Electrochemistry, Chemical analysis, Volumetric analysis, Organic compounds, Solubility, Solvents.
Identifiers: *Ion selective electrodes, *Trace levels, *Thiols, *Potentiometric titration, Reproducibility, Iodide electrodes, Sulfide electrodes, Chloride electrodes, Copper electrodes, Lead electrodes, Bromide electrodes, Mercuric perchlorate, Chemical recovery, *Mercaptans, Quinolinethiol, Toluenethiol, Thiosalicylic acid, Thiomallic acid, Dodecanethiol, Thionalide, Mercaptoacetic acid, Potassium salts, Glutathione, Sodium salt.

Described is the potentiometric determination of a variety of thiols. Microamounts (0.01 to 0.1 mM) are titrated with 0.01 N mercuric perchlorate while semimicroamounts (0.1 to 0.5 mM) are titrated with 0.05 N mercuric perchlorate. A bromide selective indicator electrode and a single-junction reference electrode are used with an expanded-scale pH meter to monitor the emf. Other indicator electrodes based on a silver sulfide matrix may also be used. The preferred solvent is acetone while ethanol and p-dioxane have limited applicability. The electrode response is slower in general than for other titrations using ion-selective electrodes, particularly for the more complex thiols and those attached to a heterocyclic ring system. ON MULTIDISCIPLINARY RESEARCH ON THE APPLICATION OF REMOTE SENSING TO WATER RESOURCES PROBLEMS.
Wisconsin Univ., Madison. Inst. of Environmental Studies.

Available from the National Technical Information Service as N73-13378, $3.00 in paper copy, $1.45 in microfiche. 1971-1972 Progress Report No NASA-CR-129797, 1972. 83 p, 31 fig, 13 tab, 7 ref. Contract No NGL-50-002-127.

Descriptors: *Remote sensing, *Water quality, *Monitoring, *Aquatic environments, *Research and development, *Water resources, Great Lakes, Pollutant identification, Laboratory tests, Model studies, On-site investigations, Methodology, Water pollution, Lake Superior, Lake Michigan, Mathematical models, Hydrologic properties, Powerplants, Aerial photography, Photogrammetry, Outlets, Eutrophication, Industrial wastes, Pulp wastes, Pulp and paper industry, Aquatic plants, Primary productivity, Ecosystems, Instrumentation.
Identifiers: Thermal scanning imagery, Lake Wingra, Myriophyllum spicatum, Macrophytes, Infrared radiometry, Oedogonium, Nuphar, Nymphaea, Lake Mendota, Data interpretation, Wisconsin River, Fox-Illinois River, Fox River, Galena River, Ceratophyllum demersum, Infrared thermal scannery.

Progress has been made in relation to five specific water resources problems to which remote sensing techniques have been applied in on-going research. The problem areas are: (1) water pollution monitoring, (2) effluent mixing zone modeling, (3) current and circulation modeling, (4) determination of hydrologically active source areas, and (5) analysis of aquatic ecosystems. Briefly stated, the programs in these areas have the following objectives: (1) To ascertain the extent to which special aerial photography can be used in monitoring water pollution parameters through a comparison of photo imagery and actual pollution conditions. (2) To develop a relationship between the extent of the 'mixing zone' in terms of outfall effluent, and water body characteristics by utilizing the imagery obtained from intensive aerial remote sensing and applying the derived data in duplicating the 'mixing zone' charcteristics in a series of laboratory model studies. (3) To determine the fine scale structure and efficiency of nearshore circulation patterns in the Great Lakes through the use of thermal scanning imagery and analytic photogrammetric techniques. (4) To develop a remote sensing technique for determining the location and extent of source areas in a watershed. (5) To use remote sensing in the development of a production model for Myriophyllum spicatum L. in Lake Wingra, and to evaluate the field potential of remote sensing techniques in detecting the occurrence, intensity, duration and composition of algal blooms in the Madison, Wisconsin, area lakes. The methods and data for each of the 5 areas are given. (Mortland-Battelle)

Descriptors: *Zooplankton, *Arctic Ocean, Crustaceans, Invertebrates, On-site data collections, Benthic fauna, Arctic, Amphipoda, Copepods, Isopods.
Identifiers: *Appendicularians, *Taxonomic guides, Macroinvertebrates, Mysids, Ostracods, Eunicates, Oikopleura spp, Fritillaria spp, Appendicularia, Kowlewskai, Euphausiids, Decapods, Parathyconchoecia, Boreomysis spp, Parerythrops spectabilis, Pseudomma frigidum, Michthyops keeli, Mysis spp, Conchoecia spp, Acetabulastoma arcticum.

Six practical taxonomic guides to zooplankton were prepared to the USC Arctic Project to meet the needs to non-taxonomists involved with Arctic fauna. Material presented in this guide is based upon results of research by investigators associated with this Project and its precursors since 1952. This compilation is composed of information on the five species of ostracods and five species of appendicularians found amongst central Arctic zooplankton; mysids from the central Arctic and peripheral seas; and a general guide to Arctic zooplanktonic crustaceans. Each guide contains dichotomous keys and complementary illustrations, special notes on individual species, and selected references to literature pertaining to the included groups. (Holoman-Battelle)

The research program is summarized on microorganisms that oxidize ammonia to nitrite and nitrite to nitrate, including their fine-structure and biochemical properties, distribution, and the rates of the in-situ reactions. Degradation rates of urea, acetate, and glucose in estuarine and offshore waters were measured using labelled compounds. A test being developed that is specific for bacterial biomass in the presence of the biomass of other organisms also has potential applications in water pollution studies, determination of bacteria in sediment, and detection of contamination of radioisotope solutions intended for injection into patients. In this test, a lysate from the blood of the horseshoe crab is used to detect free bacterial lipopolysaccharides (also known as pyrogens or endotoxins). (Bopp-ORNL)

Identifiers: Cesium radioisotopes.

A concentration factor of about 300 was found for a bivalve under conditions favoring uptake from food (chronic contamination of the water in the presence of phytoplankton, light, and silt). Also the uptake from food and sediment and effects of potassium, sediment agitation, temperature, and bivalve age were determined. A computer program modelled the simultaneous effects of three variables. In bivalves removed from contaminated water 38% of the total radioactivity was on the shell, 20% in the viscera, 22% in the other soft parts and 13% in internal fluid. After 81 days decontamination in uncontaminated water the loss of radioactivity by the shell was 52%; by the soft parts, 25%; and by the internal liquid, 50%. Long-term biological half-times are given for various components of the bivalve (66-90 days for the entire bivalve, 32-45 days for the shell, and 72-90 days for the soft parts), and also for the individual organs. The results are compared with those by other authors. (Bopp-ORNL)

Identifiers: Plutonium, Environmental impact statements.

Fourteen abstracts (of 25) concern analysis of radionuclides in humans or animals; ten abstracts concern analysis of water, soil, or freshwater and marine benthic organisms; and one abstract concerns the preparation of environmental impact statements. The ratio of the tritium specific activity in the organic or residue fraction to that in free water was 5-10 for soil and 1-1.2 for milk. Accumulations of radionuclides from nuclear powerplant discharges were located using a submersible NaI (Tl) probe. In environmental samples, reactor-produced and atmospheric-fallout Pu were distinguished by alpha spectrometric determination of the Pu240/Pu239 ratio. However, for detection of Pu-Am in large soil samples (to 1 kg), a technique using low-energy X radiation was advantageous. (Bopp-ORNL)

Descriptors: *Pollutant identification, *Neutron activation analysis, *Water analysis, *Gold, *Gold radioisotopes, *Trace elements, Pesticide residues, Chlorides, Vegetation, Absorption, Soil types, Soil-water-plant relationships, Biology, Root zone, Sampling, Geochemistry, Soil chemistry, Biochemistry, Metabolism, Analytical techniques, Separation techniques, Solvent extraction.

Developments in neutron-activation analysis have improved precision and increased sensitivity. Comparison with microanalytical techniques requiring ashing showed ashing losses of 5-70% with K, Na, Mn, Fe, Sc, Zn, Cu, S, and P. In biogeochemical studies the sensitivity for determination of Au in natural waters and in plants was about 1 ppb. Plant uptake was also studied for Sb, As, Sc, and Mn. Gold in natural water samples was absorbed on activated carbon to avoid loss from deposition on container walls. Pesticide residues were analyzed by chloride determination after inorganic chlorides has been eliminated by extraction techniques using chloride-free solvents. Eye tissue was analyzed for 15 elements; the concentration of iodide in the eye envelope was about 100 times that in blood and in most other human tissue. (Bopp-ORNL)

OCCURRENCE OF SE75 AND SN113 IN OYSTERS,
Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.
B. Patel, and A. K. Ganguly.
Health Physics, Vol 24, p 559-562. 1973. 1 fig, 2 tab, 13 ref.

Descriptors: *Radioisotopes, *Bioindicators, *Nuclear wastes, *Pollutant identification, Water pollution sources, Monitoring, Radioecology, Mollusks, Gastropods, *Oysters, Effluents, Nuclear powerplants, Analytical techniques, Radioactivity techniques, Marine animals, Estuarine environment, Absorption.
Identifiers: Tin radioisotopes, Selenium radioisotopes.

The specificity of various species of molluscs in the vicinity of the Tarapur nuclear powerplant for various radionuclides suggested their use as biological monitors. Gastropods (aplysia benedicti, Cellana radiata, and Onchidium verruculatum) concentrated Co radioisotopes; oysters (Crassostea cucullata and Crassostea gryphoides) concentrated Sn113 and Se75, which were identified by the energy of gamma spectrum lines and half lives; but not Co. The Sn113 probably results from neutron activation of Sn112 (isotopic abundance 0.95%) in fuel cladding and structural alloys; the Se75, from neutron activation of Se74 of unknown origin or as a fission product. Concentrations that have been reported in marine organisms are: Sn, 0.2-20 ppm; Se, 0.5-8.6 ppm. (Bopp-ORNL)

026, June 1973. 26 p, 6 fig, 2 ref. EPA Project 16020 GSB. 68-01-0111.

Descriptors: *Monitoring, *Phosphorus, Analytical techniques, *Flame photometry, *Pollutant identification, Automation, *Instrumentation, Measurement.

A prototype instrument was developed for automatically monitoring total phosphorus in water. The analytical principle employed was flame emission photometry. Phosphorus compounds burned in a hydrogen flame emit at about 525 millimicrons. Conditions were established for the sensitive measurement of phosphorus in water. Operating parameters investigated included fuel and air flow rates burner configuration, operating temperature, method of sample aerosolization, etc. Using an ultrasonic nebulizer to aerosolize samples of triethylphosphate in water, it was possible to detect phosphorus at a concentration of less than 2 parts per billion. A procedure was worked out for distinguishing between organic and inorganic phosphorus with ion exchange resins. In measurements designed to determine interference by sodium and calcium, it was observed that the method is about 1000 times more sensitive towards phosphorus than towards sodium and 5000 times more sensitive towards phosphorus than towards calcium. A prototype instrument was designed, fabricated and tested. (EPA)

A SIMPLE TECHNIQUE FOR ISOLATION OF PELODERA CHITWOODI, A BACTERIOPHAGOUS NEMATODE, FROM SOIL,
Louisiana State Univ., Baton Rouge. Dept. of Plant Pathology.
M. M. Joshi, and G. R. Wilt.
Proceedings of the Helminthological Society of Washington, Vol 40, No 1, p 167-168. January 1973. OWRR A-0160ALA (4).

Descriptors: *Nematodes, *Bacteria, *Bacteriophage, *Isolation, Analytical techniques, Pollutant identification.
Identifiers: *Pelodera, Agarbacterium, Vibrio.

A technique is described which employs bacteria for the isolation of Pelodera chitwoodi from soil. Ten grams of mud infested with eight species of nematodes were placed in the center of an agared petri dish which had been innoculated with two drops of bacterial suspension 2-3 cm from the center. After three to four hours incubation, an examination showed that ninety-nine percent of the nematodes accumulated around the bacterial colonies were the bacteriophagous Pelodera chitwoodi. Several repeated experiments gave the same results. (Owen-Alabama)

SOND CRUISE 1965: FACTOR AND CLUSTER ANALYSES OF THE PLANKTON RESULTS, A GENERAL SUMMARY,
National Inst. of Oceanography, Wormley (England).
M. V. Angel, and M. J. R. Fasham.
Journal of the Marine Biological Association of the United Kingdom, Vol 53, No 1, p 185-231, February 1973. 14 fig, 15 tab, 46 ref.

Descriptors: *Distribution patterns, *Copepods, *Biological communities, *Amphipoda, Mathematical studies, Zooplankton, Invertebrates, Sampling, Marine animals.
Identifiers: *Data interpretation, *Ostracods, *Euphausiids, *Chaetognaths, Factor analysis, Cluster analysis, Canary Islands, Macroinvertebrates.

The data for five planktonic taxa sampled during the SOND cruise (autumn 1965) by R. R. S. 'Discovery' in a day and a night series of horizontally towed nets have been analyzed by factor and cluster analyses. The factor analyses of hauls showed that there were five biologically distinct zones in the water column between the surface and 1000 m. The zones were more distinct in the day series than in the night. Factor analyses of the individual taxa gave sensible groupings of species and the factor score plots gave 'averaged' depth distributions for each group. Cluster analyses of the individual taxa gave results consistent with the factor analyses. Both methods gave groupings which fitted the zonation patterns of the hauls, except for the two zones between 100 and 460 m at night. Only cluster analyses could be carried out on the total data matrices. Although satisfactory interpretation was only possible with the aid of the analyses of the individual taxa, the zonation and species groupings were again largely retained. The zonation of the planktonic taxa is very similar to that described for nektonic species sampled on the same cruise. The usefulness of these analytical methods is compared with the conclusions of other investigators. It is concluded that the rotation of the matrices to simple structure in the factor analysis gave a marked improvement in the ease of interpretation. For the data, principal component analyses gave very similar results to the full factor analyses. (Little-Battelle)

IDENTIFICATION BY MEANS OF RETENTION PARAMETERS,
Max-Planck-Institut fur Kohlenforschung, Muelheim an der Ruhr (West Germany).
G. Schomburg, and G. Dielmann.
Journal of Chromatographic Science, Vol 11, No 3, p 151-159, March 1973. 7 tab, 33 ref.

Descriptors: *Gas chromatography, *Organic compounds, Pollutant identification.
Identifiers: *Kovats indices, *Retention time, *Retention volume, Hexane, Benzene, Methylpentanes, Hexenes, Cyclohexanes, Chlorohexanes, Hexanals, Hexanones, Hexanols, Cyclohexanones, Octenes, Methylnonane, Hexylcyclopropanes, Undecanes, Standardization, Reproducibility.

Retention parameters, preferably Kovats indices, can be used to identify chromatographically separated components of mixtures, and in addition, chemical derivatives thereof. For reliable correlations of peaks, combined use of other mainly spectroscopic identification methods is necessary. There are two different methods of applying Kovats indices which are table matching and/or incremental predictions of I and delta I values. Identification by table matching is demonstrated with saturated and unsaturated hydrocarbons from C5 to C6 of a gasoline cut and C6 compounds. Identification by retention increments is demonstrated with 1-ocetene, 2-methylnonane, 3-methylnonane, hexyl-cyclopropane, methyl-branched undecanes, and unsaturated and methyl-branched cyclopropanes. The extended use of retention parameters are limited until recently because of a lack in data reproducibility due to column polarity and apparatus parameters. Proposals are made as to how these difficulties may be overcome and as to the corrections and standardizations which may be made in order to obtain precise data. (Little-Battelle)

THE SIGNIFICANCE OF HYDROCARBON ASSIMILATION IN YEAST IDENTIFICATION,
Technische Hogeschool, Delft (Netherlands). Lab of Microbiology.
P. Bos, and J. C. de Bruyn.
Antonie van Leeuwenkoek, Vol 39, No 1, p 99-107, 1973. 4 tab, 35 ref.

Descriptors: *Yeasts, *Pollutant identification, *Systematics, Organic compounds, Classification, Aquatic fungi, Pathogenic fungi, Marine fungi
Identifiers: *Assimilation, *Hydrocarbons, Substrate utilization, Octane, Decane, Hexadecane, Alkanes, Nutrient sources, Candida spp, Ascomycetes, Basidiomycetes, Fungi imperfecti, Culture media, Ambrosiozyma cicatricosa, Debaryomyces nepalensis, Hansenula spp, Pichia spartinae spp, Saccharomyces cordubensis, Saccharomyces gaditensis, Bullera dendrophila, Sporobolomyces antarcticus, Brettanomyces, Torulopsis spp, Trichosporon spp, Selenotila spp, Debaryomyces spp, Metschnikowia spp, Lipomyces spp, Schwanniomyces spp, Sporidiobolus spp, Sporobolomyces spp, Selenotila spp, Hansenula spp, Saccharomyces spp, Kluyveromyces spp, Trichosporon aquatile, Trichosporon cutaneum var. antarcticum.

A large number of yeasts were screened for the ability to assimilate hydrocarbons. Not only representatives of the genus Candida, but also species from other perfect and imperfect genera are able to use n-alkanes as sole carbon and energy source. The significance of this feature in yeast systematics is discussed. In general, all strains of a species share either the ability to assimilate hydrocarbons or the failure to do so. Exceptions are found in species regarded as heterogeneous, like Candida sake, Candida diddensii and Candida zeylanoides. In cases where the usual criteria used in identification seem to be inadequate, the simple hydrocarbon assimilation test may be useful. Also in subgrouping the genera Candida and Torulopsis the test may be of value, because some perfect genera like Hansenula, Kluyveromyces and Saccharomyces lack hydrocarbon-assimilating representatives. MERCURY RESIDUES IN FISH, 1969-1970 - NATIONAL PESTICIDE MONITORING PROGRAM,
Bureau of Sport Fisheries and Wildlife, Washington, D.C. Div. of Fishery Research.
C. Henderson, A. Inglis, and W. L. Johnson.
Pesticides Monitoring Journal, Vol 6, No 3, p 144-159, December 1972. 2 fig, 2 tab, 8 ref.

Descriptors: *Mercury, *Freshwater fish, *Marine fish, Heavy metals, Sampling, Rivers, United States, Lakes, Hudson River, Connecticut River, Potomac River, Colorado River, Mississippi River, Rio Grande River, St. Lawrence River, Lake Ontario, Lake Erie, Lake Huron, Lake Michigan, Lake Superior, Ohio River, Missouri River, Columbia River.
Identifiers: *Biological samples, *Sample preparation, *Atomic absorption spectrophotometry, Methylmercury.

As part of the fish monitoring program conducted by the Bureau of Sport Fisheries and Wildlife since 1967, composite fish samples collected during the fall of 1969 and 1970 were analyzed for mercury. Fish were collected using seives, gill nets, traps, hook and line, and electrofishing.

Three composite samples, each of a different species and consisting of 3-5 adult fish, were collected at each of 50 monitoring stations in 1969; similarly, three composite samples and in most cases a replicate sample of one of the species were collected at each of 100 stations in 1970. Stations were located on major rivers and lakes throughout the United States. Samples were wrapped in foil, frozen, and shipped to a laboratory for analysis by atomic absorption. Each composite was thawed, cut in small pieces, homogenized in a food chopper, digested, and analyzed by the cold vapor technique. Total mercury residues equal to or exceeding the sensitivity level of 0.05 ppm were found in 129 of the 145 samples in 1969 and 373 of the 393 samples in 1970. Values ranged from less than 0.05 to 1.25 ppm in 1969 samples and from less than 0.05 to 1.80 ppm in 1970 samples. Analyses by two different laboratories of 40 selected samples from the 1970 collection gave comparable results. Analyses of 24 selected 1970 samples indicated that 90 percent or more of the mercury in fish was in the form of methyl mercury. (Little-Battelle)

ANALYTICAL APPLICATIONS OF POLYAMINE-POLYUREA CHELATING RESINS,
Massachusetts Univ., Amherst.
J. F. Dingman, Jr.
Available from Univ. Microfilms, Inc., Ann Arbor, Mich. 48106 Order No. 73-5534. PhD Dissertation, 1972. 150 p.

Descriptors: *Aqueous solutions, *Separation techniques, *Heavy metals, *Resins, Analytical techniques, *Chelation, Chemical reactions, Water analysis, Cation exchange, Cadmium, Cobalt, Copper, Manganese, Nickel, Zinc, Selectivity, Pollutant itdentification, Cations.
Identifiers: Preconcentration, *Ion exchange resins, *Polyamine resins, *Polyurea resins, Chelating, Resin synthesis, Trace levels, Metal complexes, Sample preparation, Polythiourea resins, Polydithiocarbamic acid resins, Atomic absorption spectrophotometry, Silver, Detection limits, Natural waters, Column chromatography.

Analytical applications were investigated of a family of weak base, polyamine ion exchange resins with regard to their ability to form transition metal ion complexes from aqueous solutions. The resins are selective for those metals which readily form amine complexes, and hence alkali and alkaline earth elements are not adsorbed. This is desirable in the separation, concentration, and measurement of ultra-trace heavy metal cations from natural waters which are abundant in the Groups IA and IIA elements. The program consisted of three phases: the resin synthesis, the study of the metal-amine complex formation on the resin, and the study of the ability of the polyamine resins to selectively sequester trace heavy metal cations from aqueous solutions for preconcentration purposes. Toluene diisocyanate was used to polymerize and cross-link monomeric soluble polyamines from the polyethyleneimine family. Resins from ethylenediamine, triethylenetetraamine, tetraethylenepentamine, and polyethyleneimine monomers having average molecular weights of 1200 and 1800 have been synthesized. A number of resin synthesis methods were developed. Methods were developed to coat effectively these resins on solid supports. Adsorption isotherms of some heavy metal cations on the resins were established through batch equilibration procedures. The ability of the polyamine resins to sequester trace metal ions and then release the metals upon acidification was assessed by passing known, dilute concentrations of the desired metals through the resin, eluting with hydrochloric acid, then determining the percentage recovery of the metal ions. With a concentration factor of X1000, the successful analysis of these metals was achieved at the low concentration of 0.2 ppb. Other chelating ion exchange resins were synthesized for use as substrates in the metal sequestration study. (Holoman-Battelle)

WATER: EXAMINATION, ASSESSMENT, CONDITIONING, CHEMISTRY, BACTERIOLOGY, BIOLOGY,
K. Holl.
Water de Gruyter, New York, New York. 1972. 389p.

Descriptors: *Waste water (Pollution), *Water analysis, *Methodology, *Potable water, *On-site investigations, *Laboratory tests, *Pollutant identification, Biological properties, Water chemistry, Water properties, Chemical analysis, Water quality, Indicators, Water pollution, Water sampling, Swimming pools, Mineral water, Surface waters, Aquatic microbiology, Domestic wastes, Industrial wastes, Eutrophication.
Identifiers: Sample preservation, Potassium permanganate consumption, Ammonium ions, Medicinal water, Agars, Culture media, Aluminum sulfate, Counting, Brewery wastes, Carcinogens, Biochemical tests, Mineral oil, Core samplers, Cyanides, Radioactive decontamination, Dithizone methods, Enterococci, Ferric chloride, Hydrogen peroxide, Hydrazines, Klebsiella spp, Membrane filters, Most probable number test, Proteus spp, Pollutant removal, Settleability, Staphylococci, Streptococci, Suspended matter, Sterilization, Urine, Hellige method, Nitron method, Ion selective electrodes.

This book is concerned with the investigation and quality assessment of primarily drinking water. Due to the interrelationship of potable water with other types of water, including wastewater, those topics are also treated. Areas of interest that are covered include (1) general on-site investigations and laboratory tests, (2) chemical examination methods, (3) pollution indicators, (4) tap water analysis, (5) examination and assessment of swimming bath water, surface waters, and wastewater, (6) the bacteriology of drinking water, and (7) the biology of water. RESULTS OF DRINKING WATER TESTING IN THE SZCZECIN PROVINCE AREA UNDERTAKEN AS PROPHYLACTIC MEASURE AGAINST ALIMENTARY POISONING OF INFANTS, (IN POLISH),
H. Pilawaka, and D. Torum.
Rocz Panstw Zakl Hig. Vol 22, No 6, p 665-671. 1971. Illus. English summary.
Identifiers: *Alimentary poisoning, *Infant diseases, Measure, Poisoning, *Poland (Szczecin), Prophylactic, Testing, *Potable water.

CHEMICAL TESTING OF DRINKING WATER WAS CONDUCTED ROUTINELY FOR 4 YR IN 122 RANDOMLY CHOSEN RURAL WELLS LOCATED ON INDIVIDUAL FARMS IN THE Szczecin Province area of Poland. The tests included nitrate level determinations. In 78% of the cases, the amount of nitrates exceeded the 10 mg NNO3/1 level considered permissible in drinking water for infants. A proposal is made to introduce compulsory testing of the well water on those farms where the family is expecting offspring.--Copyright 1973, Biological Abstracts, Inc.

COLORIMETRIC ASSAY FOR CARBOXYMETHYLOXYSUCCINATE, A NEW DETERGENT BUILDER,
Lever Bros. Co., Edgewater, N.J. Research Center.
J. P. Viccaro, and E. L. Ambye.
Journal of the American Oil Chemists' Society, Vol 50, No 6, p 213-217, June 1973. 5 fig, 6 tab, 30 ref.

Descriptors: *Assay, *Detergents, *Methodology, *Water analysis, *Pollutant identification, *Spectrophotometry, *Waste identification, Colorimetry, Sewage effluents, Color reactions, Chemical reactions, Waste water (Pollution), Chemical analysis, Organic compounds, Organic acids, Sewage treatment, Pollutants.
Identifiers: Trisodium carboxymethyloxysuccinate, Chemical interference, Sample preparation, Sensitivity, Accuracy, Quantitative analysis, Detection limits, *Carboxymethyloxysuccinate, Dextrose, Glycolic acid, Acetaldehyde, Butyraldehyde, Formaldehyde, Propionaldehyde, Benzoic acid, Citric acid, Fumaric acid, Gluconic acid, Lactic acid, Malic acid, Oxalic acid, Oxaloacetic acid, Succinic acid, Tartaric acid, Beta-naphthol, Absorption spectra, Chemical recovery.

A spectrophotometric assay was developed for the quantitative determination of carboxymethyloxysuccinate (CMOS), a new detergent builder. The method was based on the color produced with beta-naphthol in 92.5 percent (w/w) sulfuric acid. As little as 1.0 microgram of carboxymethyloxysuccinate can be measured. Pretreated and untreated samples from sewage effluents and river waters were prepared with solutions of CMOS ranging from 1 to 30 ppm. The samples were centrifuged, Millipore-filtered through a 0.22-micron membrane, and acidified with concentrated HCL to 1.0 N. Mililiter samples were placed into test tubes, evaporated to dryness and assayed according to the prescribed procedure. The CMOS recovery values were almost identical in both the sewage effluent and river water samples; the mean absolute recovery values (least squares slopes) were 97 and 96.4 percent, respectively. The recovery of similar amounts from the same samples, which were treated under the pretreatment procedure, was 94.5 percent for the primary sewage and 93.7 percent for river water. The results of an investigation to determine which compounds may interfere with detection of CMOS showed that under the prescribed assay conditions, glycolic, lactic, tartaric and dextrose equal in weight to CMOS, contributed only 1.2, 1.5, 4.7 and 1.5 percent errors, respectively. These small errors could be tolerated in most instances. Of particular significance was the lack of interference from the Krebs cycle intermediates, citric, fumaric, malic, oxaloacetic and succinic acids. Formaldehyde and acetaldehyde were also included in this experiment but displayed no absorbances, since both compounds were removed during the evaporation step. The addition of HCl and evaporation steps not only permitted the use of very dilute samples and an initial concentration of 92.5 percent for maximum sensitivity, but also provided additional specificity to the method by reducing interferences from glycolic and lactic acids, and dextrose. (Holoman-Battelle)

AN IMPROVED METHOD FOR THE ANALYSIS OF LINEAR ALKYLATE SULFONATE,
Calspan Corp., Buffalo, N.Y.
I.. K. Wang, J. Y. Yang, and M. H. Wang.
Preprint, presented at the 28th Annual Purdue Industrial Waste Conference, Purdue University, Lafayette Indiana. May 1973; 18 p, 1 fig, 2 tab, 4 ref.

Descriptors: *Surfactants, *Detergents, Aqueous solutions, Saline water, Sea water, *pollutant identification, Analytical techniques, Water analysis, *Linear alkylate sulfonates, Volumetric analysis.
Identifiers: Quarternary ammonium salt, Sodium tetraphenylboron, Two-phase titration, *Anionic surfactants.

The wide usage of linear alkylate sulfonate type detergents in both domestic and industrial applications together with the known toxicity of these pollutants has made the surveillance of anionic surfactant discharges in waste water effluents one of the most important water quality safeguard requirements. The needed routine analysis task is complicated by the acknowledged difficulty inherent in the determination of trace quantities of anionic detergents in saline water. The current accepted procedures are designed mainly to establish an upper limit of the surfactant content and their applicability is limited to water samples free of other major pollutants. The improved procedure developed in this study is suggested for a broader application to the analysis of anionic surfactants in polluted fresh or saline waters.

DETERMINATION OF MERCURY IN GEOLOGIC MATERIALS BY FLAMELESS ATOMIC ABSORPTION SPECTROMETRY,
Geological Survey, Washington, D.C.
J. Marinenko, I. May, and J. I. Dinnin.
Geological Survey Prof. Paper 800B, p B151-B155, 1972. 3 fig, 2 tab, 13 ref. 23*Mercury, Geological investigations, *Analytical techniques, Sampling, Calibrations, Geology, Statistical methods, *Pollutant identification.
Identifiers: *Atomic absorption spectroscopy, Geological materials, Sample preparation, Combustion tubes, Errors.

A flameless atomic absorption method is described for determining submicrogram amounts of mercury. Powdered samples are heated with a calcium oxide-cupric oxide flux in a quartz combustion tube packed with lime and elemental copper. Evolved mercury vapor is swept through a packing of gilded silica where it is amalgamated. The amalgam is rapidly heated and the released mercury vapor is swept through an absorption cell and determined by atomic absorption spectrometry. Two nanograms of mercury absorb 1 percent of the incident signal. Tracer studies with Hg 203 indicated 97 percent recovery of mercury at submicrogram levels during the sintering and amalgamation step. The release of submicrogram levels of mercury from the gilded silica for its detection by atomic absorption is better than 99 percent complete. (Oleszkiewicz-Vanderbilt)

5B. Sources of Pollution

SULFUR BUDGET OF LAKE SHELBYVILLE, ILLINOIS, AND THE EFFECTS OF SULFIDES UPON CHAOBORUS,
Illinois Univ., Urbana. Water Resources Center.
W. U. Brigham, and S. R. Gnilka.
Available from the National Technical Information Service as PB-222 497, $3.50 in paper copy, $1.45 in microfiche. Research Report No 66, June 1973. 59 p, 5 fig, 7 tab, 30 ref. OWRR A-056-ILL (1). 14-31-0001-3813.

Descriptors: Limnology, *Sulfur, *Bacteria, Reservoirs, Bioassay, *Illinois, *Sulfur bacteria, Regression analysis, Water pollution sources, Water pollution effects.
Identifiers: *Chaoborus, *Lake Shelbyville (Ill).

The sources and annual cycle of sulfur were studied in the Lake Shelbyville Basin, Illinois, from 6 April 1972 through 28 March 1973. Three sources of sulfur were identified: rainfall, surface runoff, and pollution. Decomposition of inundated organic matter and solution of inorganic sulfur compounds from the inundated basin were considered one-time sources. Exchange between groundwater and the lake was considered to be in long-term equilibrium. Significant relationships between sulfate loading and discharge were detected. Regression analysis yielded an accurate means of calculating sulfate concentration from discharge measurements. Green sulfur bacteria were isolated from lake samples during the study year. During the previous summer stagnation period, purple sulfur bacteria were detected accompanying noticeable concentrations of hydrogen sulfide. Static bioassay studies of Chaoborus larvae yielded a minimum effect level for sulfide of 0.64 mg liter -1 (as S) for a 4-hour test. Pupae responded more rapidly to sulfide than did larvae. Relatively brief exposure to a low sulfide concentration was often sufficient to kill or immobilize a substantial percentage of the test organisms.
W73-13005

FACTORS CONTROLLING COPPER (II) CONCENTRATIONS IN THE KEWEENAW WATERWAY,
Michigan Technological Univ., Houghton. Dept. of Chemistry and Chemical Engineering.
D. G. Leddy.
Available from the National Technical Information Service as PB-222 463, $4.25 in paper copy, $1.45 in microfiche. Michigan State University, East Lansing, Project Completion Report, Institute of Water Research, July 1973. 105 p, 22 fig, 5 tab, 16 ref, 2 append. OWRR A-065-MICH (1). 14-31-0001-3822.

Descriptors: *Copper, *Mine wastes, Lake Superior, *Michigan, Copper compounds, Model studies, *Chemical reactions, Water chemistry, Lethal limit, Toxicity.
Identifiers: *Torch Lake (Mich), Keweenaw Waterway (Mich), Mine tailings.

The occurrence of copper (II) in the Keweenaw Waterway from past use of the waterway as a dumping basin for copper-bearing mine tailings is a matter of concern because of the toxic effects of copper (II) on aquatic organisms. From 1972 to the present soluble copper as well as several other cations and anions were monitored at varying depths in water exposed to mine tailings. According to water chemistry the Keweenaw Waterway may be divided into two areas: one consists of Torch Lake, and the other area is the remainder of the waterway, i.e., Portage Lake and the ship canal. The soluble copper (II) in the Portage Lake and ship canal section varies from 5 to 50 ppb and is controlled by the low copper concentration (8 ppb) water of Lake Superior which flushes this section of the waterway. The soluble copper (II) in Torch Lake seems to be controlled by a combination of chemical precipitation, dissolution, complex formation, and physical adsorption. Soluble copper in Torch Lake varies between 30 and 100 ppb. The model proposed as a description of soluble copper concentration control in Torch Lake predicts Cu++, CuCO3 (soluble), CuOH+, and Cu (organic) to be the principal copper species in solution. Cu (organic) is at times equal to 50 per cent of the total dissolved copper. Ionic copper (Cu++) is found at times to reach extremely toxic levels. The model does not predict the exact concentrations observed; it does predict the general trend.

FINITE ELEMENT SOLUTION TO UNCONFINED GROUNDWATER FLOW WITH INFILTRATION,
Rhode Island Univ., Kingston. Dept. of Civil Engineering.
W-H Chen.
M Sc Thesis, 1971. 104 p, 16 fig, 42 ref. OWRR-A-036-RI (2)

Descriptors: *Groundwater movement, *Recharge, *Path of pollutants, *Finite element analysis, Numerical analysis, Computer programs, Infiltration, Seepage, Sewage disposal.

Saturated, steady-state, unconfined groundwater flow may be calculated with a computer program which is particularly suitable for flow through heterogeneous and anisotropic porous media with complex geometric boundaries. The program can handle problems with a vertical or nearly vertical free surface. Infiltration at the free surface can also be handled with ease. An example demonstrates the applicability of the computer program. The problem concerns a two-demensional flow from a sewage-disposal field to a water-supply source. The solution is in terms of the relation between the spacing of the sewage disposal field and the water-supply source and time, in conjunction with a field test for verification and modification, it should be helpful for sanitary engineers who wish to investigate the pollution of ground water sources. CONTRIBUTIONS OF ALLOCHTHONOUS DETRITUS TO THE ENERGY REGIME OF DOE RUN, MEADE COUNTY, KENTUCKY,
Louisville Univ., Ky. Water Resources Lab.
C. R. Liston.
Research Report, May 1972. 104 p, 10 fig, 22 tab, 66 ref, append. OWRR A-032-KY (1).

Descriptors: *Nutrients, *Leaves, *Ecosystems, *Riparian plants, Organic matter, Food chains, Maple trees, Oak trees, Beech trees, Hickory trees, *Kentucky, Amphipoda, Degradation (Decomposition), Streams, Surface waters, Energy, Aquatic environment, Leaching, Biodegradation, Lipids, Proteins, Carbohydrates.
Identifiers: *Aquatic ecosystems, Beech trees.

Leaves from deciduous riparian trees provide an important source of energy and nutrients for aquatic ecosystems, especially in temperature climates. A study was undertaken in a spring-fed, woodland stream in north-central Kentucky to determine the kinds and amounts of leaves that entered the stream throughout the year, their calorific equivalents, and the protein, lipid, and carbohydrate contents of those leaves and the rates at which they were lost when submerged in the streams. Annual accumulation was 354 g/sq m/year for an estimated total of 17,700 kg. Calorific equivalents for 15 different kinds of leaves ranged from 3,789 cal/g dry weight for hickory to 4,417 cal/g for red oak. The upper 5 km of Doe Run received nearly 70 million kcal of energy from allochthonous leaf material from October 1, 1968, through September 30, 1969. The sugars and related substances leached rapidly into the streams, the lipid content leached slowly, and the protein content increased during an 8-week period. Amphipoda showed the following preference of leaves as food: hickory, red elm, sugar maple, beech, red oak, and sycamore. (Knapp-USGS)
W73-13056

INTERACTION OF YELLOW ORGANIC ACIDS WITH CALCIUM CARBONATE IN FRESHWATER,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
A. Otsuki, and R. G. Wetzel.
Limnology and Oceanography, Vol 18, No 3, p 490-493, May 1973. 2 fig, 1 tab, 18 ref. NSF GI-20 and GB-31018X, AEC AT (11-1)-1599, COO-1599-63.

Descriptors: *Organic matter, *Calcium carbonate, Lipids, Humic acids, Adsorption, Crystallization, Calcite.
Identifiers: Yellow organic acids.

Large amounts of soluble yellow organic humic acids are removed from lake water with precipitating $CaCO_3$ by adsorption and incorporation into crystals during nucleation. This mechanism may function as a scavenger of trace metals (especially iron) which are complexed with yellow acids in natural waters. Calcium carbonate particles selectively adsorb lipid material from natural waters. Yellow acids behave like lipid material with respect to association with $CaCO_3$ particles. Yellow acids can be reextracted by 0.1 M sodium acetate and 0.1 M sodium bicarbonate solutions from butanol, which also suggests that they have the characteristics of strong organic acids, rather than of phenolic compounds. (Knapp-USGS)
W73-13058

SIZE CLASSES OF ORGANIC CARBON IN SEAWATER,
Dalhousie Univ., Halifax (Nova Scotia). Inst. of Oceanography.
J. H. Sharp.
Limnology and Oceanography, Vol 18, No 3, p 441-447, May 1973. 2 fig, 3 tab, 34 ref.

Descriptors: *Colloids, *Organic matter, *Sea water, *Particle size, Carbon, Filters, Filtration.

Using carbon analyses, four size classes of organic matter in seawater were defined. An appreciable portion of the organic matter is smaller than the usually defined particulate class, but is probably not truly dissolved. This portion can be segregated using very fine membrane filters and by using membranes designed for forced dialysis. This subparticulate class should be considered as colloidal organic matter. FLOW PROPERTIES OF SUBMERGED HEATED EFFLUENTS IN A WATERWAY,
National Aeronautics and Space Administration, Langley Station, Va. Langley Research Center.
J. A. Campbell, and J. S. Schetz.
AIAA Journal, (American Institute of Aeronautics and Astronautics), Vol 11, No 2, p 223-230, Feb. 1973. OWRR-B-041-VA (3).

Descriptors: *Heated water, Injection, Flow characteristics, *Jets, *Thermal pollution, Path of pollutants.
Identifiers: *Heated effluents, Jet path.

An experimental and theoretical investigation has been undertaken to study the trajectory and growth of thermal effluents having a range of discharge velocities and temperatures. The discharge of an effluent into a waterway was mathematically modeled as a submerged jet injection process by using an integral method which accounts for natural fluid mechanisms such as turbulence, entrainment, buoyancy, and heat transfer. The analytical results are supported by experimental data and demonstrate the usefulness of the theory for estimating the location and size of the effluent with respect to the discharge point. The capability of predicting jet flow properties, as well as the jet path, was enhanced by obtaining the jet cross-sectional area during the solution of the conservation equations (a number of previous studies assume a specific growth for the area). Realistic estimates of temperature in the effluent were acquired by accounting for heat losses in the jet flow due to forced convection and to entrainment of freestream fluid into the jet.

FOSSIL PIGMENTS IN THE SURFACE SEDIMENTS OF A MEROMICTIC LAKE,
Minnesota Univ., Minneapolis. Dept. of Botany.
E. Gorham, and J. E. Sanger.
Limnol Oceanogr. Vol 17, No 4, p 618-622, 1972. Illus.
Identifiers: *Fossil pigments, Lakes, *Meromictic lakes, Sediments, *Wisconsin, *Lake sediments.

Pigment concentration and diversity were measured in surface sediments on a transect across a small, meromictic lake in northwest Wisconsin. Pigment concentrations increase several fold and diversity by a third from the shallowest to the deepest sediments. Monimolimnetic chlorophyll derivatives are about 3 X and carotenoids nearly 2 X the hypolimnetic maxima in holomictic, eutrophic Minnesota lakes. Lower pigment concentrations at the deepest point along the transect suggest slumping of littoral detritus.--Copyright 1973, Biological Abstracts, Inc.

LOSSES OF ATRAZINE IN RUNOFF WATER AND SOIL SEDIMENT,
Pennsylvania State Univ., University Park. Dept. of Soil Chemistry.
J. K. Hall, M. Pawlus, and E. R. Higgins.
J Environ Qual. Vol 1, No 2, p 172-176. 1972. Illus.
Identifiers: *Atrazine loss, Herbicides, Oats, Runoff, Sediment, Soil sediment, Toxicity, Zeamays, *Pennsylvania, *Corn.

Atrazine losses in runoff water and soil sediment were determined in 1967 and 1968 after 7 rates (0, 0.6, 1.1, 2.2, 4.5, 6.7 and 9.0 kg/ha) of atrazine were applied pre-emergent to corn (Zea mays L.) seeded on field plots of Hagerstown silty clay loam (14% slope). Average losses for all rates in 1967 in runoff water and soil sediment equaled 2.4% and 0.16% of the total applied, respectively. In 1967, at the recommended rate (2.2 kg/ha) for preemergence applications to Pennsylvania soils, composite losses were 2.5% of the applied or approximately 0.05 kg/ha. In 1968, 1 yr after atrazine application, the average loss over all rates for the combined substrates was 0.01%. Analyses of soil core samples taken from all plots in 1967 revealed that 1 mo. after atrazine application an average of 67.9% remained in the soil, and 3 mo. later recoveries had decreased to 21.4% of that applied. The following year atrazine remaining in the soil had decreased to 15.9% in April and to 5.4% in Sept. At the recommended rate of application, recoveries decreased from 39% of that applied to 9% for the same time period in 1967. In 1969, typical atrazine toxicity symptoms were found in oats growing on plots which had received 6.7 and 9.0 kg/ha of atrazine in 1967. Damage was confined to the uppermost parts of the slope.--Copyright 1973, Biological Abstracts, Inc.

PHOSPHATE MOVEMENT FROM AN AGRICULTURAL WATERSHED DURING TWO RAINFALL PERIODS,
Agricultural Research Service, Beltsville, Md. Soil and Water Conservation Research Div.
H. M. Kunishi, A. W. Taylor, W. R. Heald, W. J. Gburek, and R. N. Weaver.
J Agric Food Chem. Vol 20, No 4, p 900-905. 1972. Illus.
Identifiers: *Phosphates, Rainfall, *Watersheds (Agricultural), *Path of pollutants.

The distribution of available phosphate between dissolved and adsorbed forms carried by stream water and sediments was measured at 2 sampling stations on a stream draining an agricultural watershed during high water flows. During an intense summer storm at the watershed the total available phosphate carried by the stream was 0.762 g/ha. In a less intense spring storm the loss was 0.028 g/ha. Changes in phosphate concentration during the storms were interpreted in terms of the adsorption isotherms of the sediments, which show that material derived from subsoils and stream banks has a large adsorption capacity. Concentrations of about 200 ppb (P) in water from fertile topsoil were reduced to less than 15 ppb as it moved downstream. Detailed prediction of phosphate concentrations in moving streams depends on adequate knowledge of the quantity, chemical characteristics, and origin of the sediment carried by the stream.--Copyright 1973, Biological Abstracts, Inc.

NITROGEN BALANCE IN SOIL COLUMNS INTERMITTENTLY FLOODED WITH SECONDARY SEWAGE EFFLUENT,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
J. C. Lance, and F. D. Whisler.
J Environ Qual. Vol 1, No 2, p 180-186. 1972. Illus.
Identifiers: Cation exchange, Dentrification, Effluents, Intermitt floodings, Microorganisms, *Nitrogen balance, Sewage effluent, *Soils, Waste renovation, Water reuse, *Soil columns.

Short, frequent cycles of flooding soil columns (2 days flooded and 5 days dry) with secondary sewage effluent caused no net removal of N but transformed almost all of the N to nitrate. The net N removal during longer cycles (9-23 days flooded and 5 days dry) was 30%, and half of the N remaining in the water was concentrated into a wave of high-nitrate water, which represented 10% of the total volume of reclaimed water and was collected immediately after the dry period. Water collected from the columns after the wave of high-nitrate water passed contained 67% less N than the incoming sewage water. Alternate flooding and drying periods were necessary for consistent N removal. The net N removal was probably due to a combination of several reactions dominated by denitrification. Cation exchange was important in holding NH4+ in the soil until it could be nitrified, thereby concentrating N into smaller volumes of high-nitrate water. Denitrification is the logical reaction to investigate for higher net N removal because the soil microorganisms nitrified most of the NH4+ and N can be removed from the system as an inert gas by dentrification.--Copyright 1973, Biological Abstracts, Inc.

STUDIES ON VIBRIO PARAHAEMOLYTICUS IN KOREAN COASTAL WATERS: I. THE DISTRIBUTION OF V. PARAHAEMOLYTICUS (IN KOREAN),
Pusan Fisheries Coll. (Republic of Korea).
W. J. Lee, W. K. Choe, and S. K. Chun.
Bull Korean Fish Soc. Vol 3, No 4, p 213-218. 1970. Illus. English summary.
Identifiers: Cephalopoda, Coasts, Crustacea, Distribution patterns, Fish food, *Korea coastal waters, Mud, Poisoning, Sea, Shellfish, *Vibrio-parahaemolyticus.

The distribution of V. parahaemolyticus was studied in fish, shellfish, mud, Crustacea, sea water and Cephalopoda to determine possible origins of food poisoning in Korea. Of 517 samples obtained from mud, sea water, fish, Crustacea and Cephalopoda, 56 contained V. parahaemolyticus. Six strains were from mud samples, 7 from 44 sea water samples, 28 from 241 fish samples, 1 from 50 crustacean samples and 2 from 34 cephalopod samples. Seven strains were isolated from 48 samples in the Mokpo area and 2 were from 46 samples in the Pohang area. The number of strains in the Mokpo area and the number in the Pohang area were the highest and lowest, respectively.--Copyright 1973, Biological Abstracts, Inc

YELLOWSTONE NATIONAL PARK, BASELINE WATER QUALITY SURVEY REPORT.
Environmental Protection Agency, Kansas City, Mo. Region VII; and Environmental Protection Agency, Denver, Colo. Region VIII.

EPA Report, 1972, 115 p, 32 tab, 7 fig, 22 ref.

Descriptors: *Water quality standards, Pollutant identification, *Mountain watersheds, Water pollution sources, Oligotrophy, Data collections, Sewage effluents, *National parks.
Identifiers: *Yellowstone National Park, Missouri River, Wyoming Yellowstone Lake.

Water quality data obtained from the May 1970 to September 1970 investigation of the surface waters of Yellowstone National Park are summarized and evaluated. A brief description of climatic conditions, streamflows and past water studies is presented along with recommendations for actions to preserve and enhance existing conditions. Special appendices present detailed discussions of mine drainage in Soda Butte Creek, sewage treatment facilities evaluations, pesticide and radiological results and a summary of ranges and means of chemical, and microbiological and biological data for park waters. (Keffer-EPA)

THE GEOGRAPHIC DISTRIBUTION OF FRESHWATER HIRUDINOIDEA IN CANADA,
Calgary Univ. (Alberta). Dept. of Biology.
R. W. Davies.
Canadian Journal of Zoology, Vol 51, No 5, p 531-545, May 1973. 1 tab, 70 ref, 1 append.

Descriptors: *Systematics, Aquatic animals, *Canada, *Annelids, *Speciation, *Spatial distribution, Animal groupings, Invertebrates.
Identifiers: *Leeches, Macroinvertebrates, *Hirudinea, Cystobranchus verrilli, Illinobdella spp, Myzobdella moorei, Piscicola spp, Antinobdella spp, Batracobdella spp, Glossiphonia spp, Helobdella spp, Marvinmeyeria lucida, Placobdella spp, Theromyzon spp, Dina spp, Erpobdella spp, Moorebdella spp, Nephelopsis obscura, Bdellrogatis plumbeus, Hirudo medicinalis, Macrobdella decora, Mollibdella grandis, Percymoorensis spp.

The distribution for each species of freshwater leech (Hirudinoidea) is described and discussed on a province or territory basis. The hosts for those species recorded as temporary parasites are listed. One hundred and eight new species records are listed including 28 records new to the province or territory. Percymoorensis lateralis is recorded in Canada for the first time, and the first record of freshwater leeches in the Yukon is made. (Mortland Battelle)

HYDROCARBONS IN THE PELAGIC SARGASSUM COMMUNITY,
Woods Hole Oceanographic Institution, Mass.
K. A. Burns, and J. M. Teal.
Deep-Sea Research and Oceanographic Abstracts, Vol 20, No 2, p 207-211, February 1973. 1 fig, 2 tab, 14 ref.

Descriptors: *Chemical analysis, *Plant tissues, *Biological communities, Water sampling, Gas chromatography, Marine algae, Marine fish, Crustaceans, Food chains, *Organic compounds, Solvent extractions, Oil pollution, Absorption, Phaeophta, Marine animals, Crabs, Epiphytology, Invertebrates, Food webs, Pollutant identification.
Identifiers: *Sargassum natans, *Animal tissues, Fingerprinting, Sample preparation, Petroleum hydrocarbons, Natural hydrocarbons, Pipefish, Biosynthesis, Stomach, n-Heptadecane, n-Pentadecane, Pentadecane, Heptadecane, n-Alkanes, Portunus sayi, Planes minuta, Histrio histrio, Syngnathus pelagicus, Canthidermis, Leander tenuiformis, Macroinvertebrates, Triggerfish, Pelagic animals.

Samples of pelagic Sargassum weed and associated macrofauna were collected by dip-netting from ships using precautions against shipboard contamination described by Grice et al (1972). Before extraction, the plants were shaken free of animals and washed with pentane to remove surface contamination without disrupting the cells. These washings were analyzed to determine hydrocarbons adsorbed on the plant surface. Pentane-washed animals were gutted for stomach analysis, cut into small pieces, soxhlet extracted with distilled methanol for 48 hr, and this lipid extract partitioned into acid-washed, sodium distilled pentane. The pentane extract was concentrated, dried, purified on a 1:1 (vol:vol) column of alumina over silica gel, eluted and chromatographed on a 3 percent Apiezon L on Chromasorb W AW-DM CS) column. All the organisms appeared contaminated with petroleum hydrocarbons. There was no relation between the amount of natural, recently biosynthesized hydrocarbons in an organism and the amount of petroleum contamination. Animals had a larger ratio of petroleum to natural compounds than the Sargassum. There was no relation between the hydrocarbon content and the animals supposed positions in the food chain. GEOTHERMAL MERCURY POLLUTION IN NEW ZEALAND,
Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Chemistry Div.
B. G. Weissberg, and M. G. R. Zobel.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 3, p 148-155, March 1973. 2 fig, 2 tab, 14 ref.

Descriptors: *Mercury, *Rainbow trout, *Brown trout, *Bottom sediments, Chemical analysis, Water pollution, Lake sediements, Fluvial sediments, Water pollution sources, Heavy metals.
Identifiers: *New Zealand, *Muscle, Reduction aeration technique, Flameless atomic absorption spectrophotometry, Sample preparation, Waikato River, Lake Rotorua, Lake Rotomahana, Lake Taupo, Lake Okareka, Lake Maraetai, Salmo trutta, Salmo gairdneri, Wet ashing, Animal tissues, Geothermal sources, Methylmercury.

In connection with the study of the magnitude and extent of natural mercury pollution arising from

geothermal sources in New Zealand, rainbow and brown trout and sediments from the Waikato River lakes and some of the Rotorua lakes were analyzed for total mercury. A modified, stannous chloride reduction-aeration flameless AA technique, after wet ashing with nitric and sulfuric acids was used in the analysis. Check analyses, specific for methylmercury, were performed by gas chromatography on half of the trout samples. The results indicate much higher concentrations of mercury in trout living in waters receiving considerable geothermal discharges (Upper Waikato River, Lake Rotorua, and Lake Rotomahana) than in trout living in similar waters receiving little or no geothermal discharges (Lake Taupo and Lake Okareka). The concentrations of mercury in trout within a given lake increased with increasing fish weight, consistent with observations by others, and no distinct differences in mercury concentrations were observed between rainbow and brown trout, or between male and female trout of the same species, apart from the weight factor. The concentrations of mercury in sediments showed no apparent variation with increasing depth (i.e. age) of sediments. (Holoman-Battelle)

EPOXIDATION AND FATE OF (C-14)ALDRIN IN INSECTICIDE-RESISTANT AND SUSCEPTIBLE POPULATIONS OF MOSQUITOFISH (GAMBUSIA AFFINIS),
Mississippi State Univ., State College. Dept. of Zoology.
M. R. Wells, J. L. Ludke, and J. D. Yarbrough.
Journal of Agricultural and Food Chemistry, Vol 21, No 3, p 428-429, May/June 1973. 2 tab, 11 ref.

Descriptors: *Aldrin, *Animal metabolism, *Fish populations, *Bioassay, *Path of pollutants, Water pollution effects, Pesticide toxicity, Chlorinated hydrocarbon pesticides, Insecticides, Chemical analysis, Proteins, Killifishes, Laboratory tests.
Identifiers: *Mosquitofish, Gambusia affinis, Fate of pollutants, *Detoxification, Epoxidation, Thin layer chromotography, Animal tissues, Liver, Brain, Sample preparation, Cleanup, Resistance.

One susceptible and two resistant populations of mosquitofish (Gambusia affinis) were treated with (C-14)aldrin to determine differences in aldrin epoxidation between susceptible and resistant mosquitofish brains and livers. Three groups of nine fish from each population were tested in 5 ppb of (C-14)aldrin. The aldrin was shown by assay to contain 2.5 percent dieldrin. Three fish were removed from each group after 4-8 hr exposure, washed carefully, and tissue samples were extracted and homogenized. After protein determination, samples were extracted three times with hexane and twice for recovery of lipid-bound material in the brain with 3:1 chloroform-methanol. Thin-layer chromotography samples were prepared from the remaining aqueous portion of the samples and were counted using a scintillation spectrometer. Resistant mosquitofish converted aldrin to dieldrin and/or water-soluble material at a greater rate than susceptible mosquitofish. These data would tend to support rate of detoxification as a possible mechanism of resistance to aldrin in the mosquitofish. (Mortland-Battelle)

ISOTOPHIC TRACER TECHNIQUES FOR IDENTIFICATION OF SOURCES OF NITRATE POLLUTION,
Tennessee Valley Authority, Muscle Shoals, Ala. Div. of Agricultural Development.
E. P. Edwards.
Journal of Environmental Quality, Vol 2, No 3, p 382-387, July-September 1973. 4 tab, 25 ref.

Descriptors: *Tracers, *Path of pollutants, *Nitrates, Nitrogen, Radioisotopes, Fertilizers, Pollutant identification.

The use of labeled fertilizers with N-15 contents substantially higher or lower than the natural abundance figure is the only valid approach to the measurement of fertilizer contribution to the NO3 appearing in tile drains under field condition. The natural N-15 abundance approach to the measurement of percentage contribution of applied fertilizers to nitrate production was not successful in well-replicated laboratory incubation experiments. Time of incubation may be eliminated as a variable by incubating the control and fertilized samples for the same time and under exactly the same conditions. (Knapp-USGS)

SALT PICKUP FROM AGRICULTURAL LANDS IN THE GRAND VALLEY OF COLORADO,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
G. V. Skogerbee, and W. R. Walker.
Journal of Environmental Quality, Vol 2, No 3, p 377-382, July-September 1973. 7 fig, 3 tab, 7 ref.

Descriptors: *Water pollution sources, *Colorado River, *Salinity, *Path of pollutants, Return flow, Irrigation, *Colorado, Water pollution, Water quality, Salts.
Identifiers: *Grand Valley (Colo).

Introduction of seepage and deep percolation losses to saline soils and aquifers, and the eventual return of these flows to the river system with their large salt loads, make the Grand Valley in Colorado one of the more significant salinity sources in the Upper Colorado River basin. The principal components of both the water and salt flow systems were delineated, and water and salt budgets were generated on a monthly basis for the water years 1969-1971. About 51,039 metric tons of dissolved solids are being added from the small 1876 ha test area. This salt contribution of about 27.1 metric tons/ha is proportionate to the valley-wide pickup. From this analysis, it is concluded that salinity control alternatives must focus on reducing the flow of water in the groundwater system. Possible measures include conveyance channel linings and improved on-farm water management practices. (Knapp-USGS)
W73-13202

POLLUTION OF KARST AQUIFERS,
A. I. George.
Water Well Journal, Vol 27, No 8, p 28-32, August 1973. 4 photo, 7 ref.

Descriptors: *Karst, *Land subsidence, *Water pollution sources, *Urban runoff, Sinks, *Kentucky, Karst hydrology, Urbanization, Urban hydrology, Path of pollutants, *Aquifers.
Identifiers: *Bowling Green (Ky).

The city of Bowling Green, Kentucky is built entirely on top of the Sinkhole Plain, a karst area typified by few surface streams, total subsurface drainage through matter trunk cave passages, and a surface karst topography of sinkholes. With these conditions sinkholes collect urban runoff and transmit the polluted water vertically downward to lower trunk cave passages which are connected to surface springs of Barren River and Drakes Creek. Surface drainage characteristics are drastically altered by large shopping centers and commercial and industrial complexes with acres of pavement. The roofing-over of sections of the Sinkhole Plain rechannels sheet runoff so that only a fraction of the total number of sinkholes that previously received recharge still do so. This has put an abnormal strain on the whole hydrosystem. A higher base level is coupled with cave stream excavation of silt-filled passages that have not received active circulation since the Pleistocene glacial era. Because of this, roof-over actively promotes the development of catastrophic sinkholes. A 30-ft rise in the water level in the cave is common during high flow periods, and the cave can be expected to have an even higher flow and base level with continued roofing of the Sinkhole Plain. Cesspools, seepage pits, septic tanks, waste treatment plants, and ill-maintained municipal sewer lines are prime sources of viral-bacteriological and chemical contamination of water resources in a limestone terrain. (Knapp-USGS)
W73-13203

A LITERATURE SURVEY OF OCEAN POLLUTION,
Catholic Univ. of America, Washington, D.C. Inst. of Ocean Science and Engineering.
H. H. Shih.
Available from NTIS, Springfield, Va 22151 as AD-743 101 Price $5.45 printed copy; $1.45 microfiche. Report No 71-6, May 1971. 110 p, 18 fig, 9 tab, 386 ref. ONR Contract N00014-69-A-0432.

Descriptors: *Reviews, *Water pollution, *Oceans, *Sea water, Water pollution sources, Water pollution effects, Path of pollutants, Water pollution control.
Identifiers: *Ocean pollution.

A survey of past studies on the problems of ocean pollution also identifies research areas in which there are notable deficiencies in knowledge. Available literature was surveyed for all phases of ocean pollution. A general description is given of ocean pollution of the world today. The chief pollutants, their sources, their effects, and the control of various types of ocean pollution are discussed. (Knapp-USGS)
W73-13211

GLUCOSE FLUX AT THE SEDIMENT-WATER INTERFACE OF TORONTO HARBOUR, LAKE ONTARIO, WITH REFERENCE TO POLLUTION STRESS,
Toronto Univ. (Ontario). Dept. of Zoology.
L. W. Wood, and K. E. Chua.
Canadian Journal of Microbiology, Vol 19, No 4, p 413-420, April 1973. 2 fig, 3 tab, 31 ref.

Descriptors: *Cycling nutrients, *Sediment-water interfaces, *Lake Ontario, *Water pollution effects, *Aquatic microorganisms, Water analysis, Lake sediments, Carbohydrates, Chemical analysis, Biochemistry, Methodology, Bottom sediments, Cores, Organic matter, Stress, Absorption.
Identifiers: *Gucose, *Heterotrophy, *Nutrient flux, Fate of pollutants, Substrate concentration, Turnover time, Sugars, Substrate utilization, Catabolism.

Cycling of glucose at the sediment-water interface was determined through coupling measurement of natural substrate concentrations with heterotrophic uptake by the natural microbial communities in the sediment and in the water column. Freshly collected cores containing both a sample of the water column above the sediment-water interface as well as 20 cm of undisturbed benthic community were used for glucose analysis. The analysis for glucose followed the biochemical method of Hicks and Carey (1968). Determinations of heterotrophy in water were done by the methods of Wright and Hobbie (1966) as corrected for respiratory loss of C-1402 by Hobbie and Crawford (1969). Determinations of aerobic heterotrophy in sediment were essentially the same as those using water except that the added glucose (5-20 microliters) ranged from 27.5 to 102.5 micrograms/liter. The same general cycling pattern was found for both polluted and less polluted parts of Toronto Harbour, so that other labile organic species possibly have similar cycles. Velocity of uptake of glucose (flux) and turnover time showed no relationship to either substrate concentration or

total organic matter of the sediments. Activity in the water column could be supported to a major extent by sediment export of substrate by turbulent diffusion. Sediment activity must be supported by particulate sedimentation and hydrolysis of large organic molecules, which may be aided by the macrobenthic community. Pollution stress apparently alters the catabolism of the substrate. The observed substrate concentrations may reflect a minimum of residual concentration, below which the microbial community has difficulty in taking up the substrate. (Holoman-Battelle)
W73-13236

EVIDENCE FOR BUFFERING OF DISSOLVED SILICON IN FRESH WATERS,
University of East Anglia, Norwich (England). School of Environmental Sciences.
A. M. C. Edwards, and P. S. Liss.
Nature, Vol 243, No 5406, p 341-342, June 1973. 18 ref.

Descriptors: Freshwater, *Temporal distribution, *Spatial distribution, *Variability, Chemical reactions, Dissolved solids, Laboratory tests, Soils, Soil water, Chemical analysis, Water analysis, Lakes, Rivers.
Identifiers: Dissolved silicon, *Silicon, *Buffers.

Documented studies are presented which illustrate the low temporal and spatial variability found for dissolved silicon levels in freshwater. Sorption reactions involving dissolved silicon and solid phases are posed as the more likely buffer mechanism responsible for controlling the concentration of dissolved silicon in rivers, lakes and soils. (Holoman-Battelle)
W73-13238

EFFECT OF DYES ON BACTERIAL GROWTH,
Pennsylvania State Univ., University Park. Dept. of Microbiology.
D. Y. C. Fung, and R. D. Miller.
Applied Microbiology, Vol 25, No 5, p 793-799, May 1973. 5 tab, 8 ref.

Descriptors: *Dyes, *Growth rates, *Analytical techniques, *Aerobic bacteria, *Pollutant identification, Bioindicators, Cultures, Separation techniques, Methodology, Water pollution effects, E. coli.
Identifiers: Pollutant effects, *Bacterial physiology, Gram-positive bacteria, Gram-negative bacteria, Culture media, Tryptic soy broth, Alcaligenes faecalis, Enterobacter spp, Proteus vulgaris, Pseudomonas aeruginosa, Salmonella spp, Shigella flexneri, Serratia marcescens, Bacillus spp, Gaffkya tetragena, Micrococcus rhodochrous, Sarcina lutea, Streptococcus spp.

A rapid screening procedure was used to test the effect of 42 different dyes on the growth of 30 bacteria on solid media. Stock solutions of each dye were incorporated into a tryptic soy agar at final dilutions of 1:1000, 1:10,000, and 1:100,000 before sterilization of the media at 121C for 15 minutes. A multipoint inoculation device was used to transfer broth culture of the test organisms onto the agar surface. The agar plates were inverted for incubation at 37C for 24 and 48 hr. They were observed under incandescent as well as ultraviolet light and growth was recorded as positive or negative after 24-and 48-hr periods. The results indicated that many readily available dyes might have potential application for selective isolation of specific bacterial groups as well as value in differentiating between closely related bacterial taxa. Separation of Enterobacter from Escherichia, Salmonella from Shigella, and Staphylococcus from Micrococcus by selected dyes was also evaluated. (Mortland-Battelle)

METABOLISM OF NITRILOTRIACETATE BY CELLS OF PSEUDOMONAS SPECIES,
Michigan State Univ., East Lansing. Dept. of Crop and Soil Sciences.
J. M. Tiedje, B. B. Mason, C. B. Warren, and E. J. Malec.
Applied Microbiology, Vol 25, No 5, p 811-818, May 1973. 4 fig, 4 tab, 25 ref.

Descriptors: *Nitrilotriacetic acid, *Psudomonas, *Pollutant identification, *Metabolism, *Microbial degradation, Soil bacteria, Surfactants, Aerobic bacteria, Detergents, Cytological studies, Chemical analysis, Gas chromatography, Biodegradation, Cultures, Ammonia, Volumetric analysis, Radioactivity techniques.
Identifiers: *Fate of pollutants, *Degradation products, Substrate utilization, Scintillation counting, Manometric studies, Culture media, Liquid scintillation, Batch cultures, Aspartate, Glycine, Aconitate, Iminodiacetate, Glyoxylate, Sarcosine, Acetates, N-methyliminodiacetate.

A Pseudomonas species was isolated from soil which could degrade nitrilotriacetate (NTA) to CO2, H20, NH3, and cellular constituents without the accumulation of significant quantities of intermediates either in the presence or absence of several inhibitors. After extensive gas chromatography analysis, small quantities of aspartate, glycine, and aconitate were the only detectable compounds to accumulate during NTA degradation, and these compounds were not excreted from the cells. Manometric studies indicated that iminodiacetate, glycine, and glyoxylate are possible intermediates, whereas N-methyliminodiacetate, sarcosine, and acetate are not. The data are consistent with an oxidative cleavage of the C-N bond of NTA as the initial degradation step. The finding that NTA is readily oxidized to inorganic products and that no intermediates accumulated under a variety of conditions indicates that environmental concern for hazardous intermediates in NTA degradation seems unwarranted. COLIFORMS, FECAL COLIFORMS, AND FECAL STREPTOCOCCI AS INDICATORS OF WATER POLLUTION,
Hadassah Medical School, Jerusalem (Israel).
J. Cohen, and H. I. Shuval.
Water, Air, and Soil Pollution, Vol 2, No 1, p 85-95, March 1973. 5 fig, 3 tab, 23 ref.

Descriptors: *Coliforms, *Bioindicators, *Viruses, *Water pollution, Sewage treatment, Treatment facilities, Potable water, Lakes, Rivers, Chlorination, Efficiencies, Enteric bacteria, Pathogenic bacteria, Springs, Water wells, Water sampling, Biological treatment.
Identifiers: *Fecal coliforms, *Fecal streptococci, *Fecal pollution, Pollutant removal, Survival, Lake Kinneret, Culturing techniques, Culture media.

The presence and survival of coliforms, fecal coliforms, and fecal streptococci were studied under various ecological conditions (sewage treatment plants, heavily polluted rivers, a lake and other drinking water sources) and their relative importance as pollution indicators, especially of viral pollution, was examined for each type of water system examined. Grab samples were taken with sterile containers, filtered, and the bacteria were cultured. Coliform bacteria were cultured on m-Endo media (Difco) and counted after 24 hr incubation at 35 C. Fecal coliforms were incubated on M-FC broth (Difco) for 24 hr in a water bath at 44.5 C. Fecal streptococci were incubated for 4 hr at 35 C followed by 44 hr at 44.5 C to eliminate the growth of atypical microcolonies. In all cases the fecal streptococci were generally more resistant to the natural water environment and to purification processes than the other indicator organisms and at points distant from the original source of pollution were often the only indicators of the fecal nature of the pollution. In two of the systems studied the survival of the fecal streptococci paralleled the survival of enteric viruses better than the coliforms. The fecal streptococci may thus in certain cases provide a better estimate of the probable virus content in lightly contaminated water than the other two indicators. (Holoman-Battelle)

DISTRIBUTION AND BACKGROUND LEVELS OF MERCURY IN SEDIMENT CORES FROM SELECTED WISCONSIN LAKES,
Wisconsin Univ., Madison. Dept. of Soil Science.
J. K. Syers, I. K. Iskandar, and D. R. Keeney.
Water, Air, and Soil Pollution, Vol 2, No 1, p 105-118, March 1973. 5 fig, 2 tab, 36 ref.

Descriptors: *Mercury, *Cores, *Lake sediments, *Pollutant identification, Spatial distribution, *Wisconsin, Hydrogen ion concentration, Heavy metals, Soil analysis, Chemical analysis, Deep water, Shallow water, Hardness (Water), Bottom sediments, Aquatic soils, Dredging.
Identifiers: *Flameless atomic absorption spectrophotometry, *Vertical distribution, Sample preparation, Organic carbon, Lake Mendota, Lake Minocqua, Lake Monona, Lake Wanbesa, Lake Kegonsa, Lake Wingra, Lake Mary, Lake Crystal, Lake Snake.

The vertical distribution of Hg in sediment cores from a range of hard-and soft-water lakes in Wisconsin was evaluated in terms of potential sources of Hg during the nineteenth and twentieth centuries. Core samples were collected in the winter of 1970-1971 from deep-water areas from each lake and two cores were also taken from shallow water areas in Mendota and Minocqua. Cores were sectioned at 5-cm intervals and transferred to precleansed glass bottles. Surficial sediments were collected with an Ekman dredge. The samples were stored at 4 C and analyzed within a week post collection. Total Hg was determined on undried samples by wet digestion with H2S04/HN03 and subsequent flameless atomic absorption spectrophotometry. A sub-sample was freeze dried and used for the determination of organic C, free iron oxides extractable with citrate-dithionite-bicarbonate, and CaCO3. The pH of undried sample was measured with a glass electrode. All results were expressed on an oven-dry basis. For the Madison lakes, the trends in Hg distribution were related to variations in sewage inputs during the last 80 yr. It is unlikely that either inputs of sewage or erosional products are responsible for the observed accumulation of Hg in the most recent sediments from three lakes in northeastern Wisconsin. Background levels varied from 0.01 to 0.24 ppm Hg (intact sediment basis) in precultural sediments from the Wisconsin lakes investigated. There was no consistent relationship between the concentration of Hg and other sediment components

otential importance in the retention of Hg. Holoman-Battelle)

ETHYLMERCURY: BACTERIAL DEGRADA-ION IN LAKE SEDIMENTS,
idwest Research Inst., Kansas City, Mo.
. J. Spangler, J. L. Spigarelli, J. M. Rose, and H. . Miller.
cience, Vol 180, No 4082, p 192-193, April 13, /73. 3 fig, 11 ref.

escriptors: *Microbial degradation, *Lake sedi-ents, *Aquatic bacteria, *Mercury, Pseu-omonas, Cultures, Biodegradation, Mass spec-ometry, Michigan, Heavy metals, Pollutant entification.
entifiers: *Methylation, *Methylmercury, *Fate pollutants, Pure cultures, Volatilization, St. air River, Mixed cultures, Degradation oducts, Substrate utilization, Organomercury mpounds, Organometallics, Methane, Flame nization gas chromatography, Electron capture s chromatography.

ong-term incubation studies were carried out on e biomethylation of mercury in sediments taken om the delta area of the St. Clair River, ichigan. Various combinations of growth media d gaseous atmospheres were used in an effort to entify organisms or groups of organisms capable methylating Hg. During the first 50 days of a ng-term period of incubation of lake sediments th inorganic mercury (Hg (2 plus)), low concen-ations of methylmercury were observed to build . Upon continued incubation there was a rapid crease in amount of methylmercury in the stem and a concomitant evolution of volatile in-ganic mercury (Hg). Transfer of the mixed cul-re to growth media containing methylmercury sulted in the degradation of methylmercury and e volatilization of Hg. Four bacterial isolates ere obtained from the mixed culture which, in re culture, rapidly degraded methylmercury to ethane and Hg. The presence of methane in head ace gases was confirmed by flame ionization gas romatography, and the presence of Hg in head ace gases was confirmed by mass spectrometry. Ioomoman-Battelle)

ULPHATE DEPOSITION BY PRECIPITATION TO LAKE ONTARIO,
tmospheric Environment Service, Toronto (On-rio).
W. Shaw, and D. M. Whelpdale.
ater, Air, and Soil Pollution, Vol 2, No 1, p 125-8, March 1973. 2 tab, 7 ref.

escriptors: *Sulfates, *Water pollution sources, Precipitation (Atmospheric), *Snowfall, *Lake ntario, Chemical analysis, Specific conductivity, me, Hydrogen ion concentration, Sampling, Pol-tants.
entifiers: *Fate of pollutants.

mples of falling precipitation were collected ree times at eleven sites along western Lake On-rio. Care was taken that the sampling was done ring periods of prolonged, continuous precipita-n and also that the collectors (suitably cleaned lyethylene pails) were set out and taken in thin approximately 1 hr of the beginning and end the precipitation, from individual snow storms several hours duration indicate that approxi-ately 9-66 mg/sq m of sulfate is being deposited r storm. Using a mean sulfate concentration in precipitation in this region (throughout the year) of 4 mg/l and an annual accumulation of precipitation of 760 mm, the total annual deposition of sulphate by precipitation alone is almost 3 g/sq m, or a total of 4,000 metric tons over the western end of the Lake. The annual deposition of sulfate by precipitation is, therefore, about 0.1 percent of the total mass of sulfate. This is significantly of the same order of magnitude as that discharged directly into the Lake by industry. (Holoman-Battelle)

CHLORINATED HYDROCARBONS IN PLANKTON FROM THE GULF OF MEXICO AND NORTHERN CARIBBEAN,
Texas A and M Univ., College Station, Dept. of Chemistry.
C. S. Giam, M. K. Wong, A. R. Hanks, W. M. Sackett, and R. L. Richardson.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 6, p 376-382, June 1973. 2 fig, 1 tab, 15 ref.

Descriptors: *Plankton, *Polychlorinated biphenyls, *DDT, Chlorinated hydrocarbon pesticides, Sampling, *Gulf of Mexico, Chemical analysis, Solvent extractions, Pollutant identification, Marine animals, Marine plants, Zooplankton, Phytoplankton, Sea water.
Identifiers: *Metabolites, *Caribbean Sea, Electron capture gas chromatography, Sample preparation, Aroclor 1242, Aroclor 1248, Aroclor 1254, Aroclor 1260, Detection limits.

During 1971 and 1972 a baseline study of pollutants in the open Gulf of Mexico and Northern Caribbean, sponsored by the International Decade of Ocean Exploration, was conducted. Plankton samples were collected over extensive areas of the Gulf of Mexico and Northern Caribbean. The samples were analyzed by electron capture gas chromatography for DDT, its metabolites and PCBs, in order to determine the concentration and distribution of these contaminants in the lowest levels of the marine food chain. From the results, it appears that DDT's and PCB's are widely spread but at a low level. There were few discernible geographic trends in the sampled areas. About 70 percent of the samples gave higher PCB than DDT values. No definite trend can be observed from the PCB/DDT ratio of the samples analyzed. Generally, the total DDT and PCB levels in plankton samples is comparable to that in small whole fish and muscle of some larger fish. (Holoman-Battelle)

COMPARATIVE EXTRACTION OF CHLORINATED HYDROCARBON INSECTICIDES FROM SOILS 20 YEARS AFTER TREATMENT,
Agricultural Research Service, Beltsville, Md. Agricultural Environmental Quality Inst.
R. G. Nash, W. G. Harris, P. D. Ensor, and E. A. Woolson.
Journal of the Association of Official Analytical Chemists, Vol 56, No 3, p 728-732, May 1973. 8 tab, 14 ref.

Descriptors: *Soil analysis, *Pesticide residues, *Chlorinated hydrocarbon pesticides, Aldrin, Dieldrin, Endrin, Heptachlor, DDT, Separation techniques, Gas chromatography, Statistical methods.
Identifiers: *Shake extraction, *Soxhlet extraction, Column extraction, Isodrin, Chlordane, Toxaphene, BHC, Delan, Heptachlor epoxide, Nonachlor, Lindane, Sample preparation, Gas liquid chromatography, Endrin ketone, Endrin alcohol, Endrin aldehyde, Organic solvents, Isomers.

Three methods, shake, Soxhlet, and column, were compared for efficiency of extraction of certain chlorinated hydrocarbon insecticides from a Congaree sandy loam soil which had been treated 20 years earlier. Column extraction had a tendency to be less efficient than the other 2 methods, but statistically there were no differences in extraction efficiences among the 3 methods for aldrin, dieldrin, heptachlor, chloradane, isodrin, endrin, toxaphene, or Dilan and their residue products. However, shake extraction was significantly more efficient for the BHC isomers than Soxhlet extraction and the latter was significantly more efficient than column extraction. (Little-Battelle)

ECOLOGY OF TWO RELATED SPECIES OF CADDIS FLY LARVAE IN THE ORGANIC SUBSTRATES OF A WOODLAND STREAM,
McGill Univ., Montreal (Quebec). Dept. of Biology.
R. J. MacKay, and J. Kalff.
Ecology, Vol 54, No 3, p 499-511, Late Spring 1973. 5 fig, 9 tab, 30 ref.

Descriptors: *Caddisflies, *Larvae, *Organic matter, Ecology, *Aquatic habitats, *On-site tests, *Laboratory tests, Detritus, Leaves, Natural streams, Animal populations, Niches, Aquatic insects, On-site investigations, Invertebrates, Water sampling.
Identifiers: *Woodland stream, *Substrate utilization, Food sources, Surber sampler, Sample preservation, Pcynopsyche luculenta, Pycnopsyche gentilis, West Creek, Substrates, Macroinvertebrates, Detritivores, Sympatric species.

Two species of Pycnopsyche larvae inhabiting allochthonous organic materials in West Creek are contemporaneous and similar in size. Field studies and laboratory experiments show that about 90% of P. gentilis larvae live in fallen leaves, which they use as food and for case materials; the remaining 10% occur in detritus with P. luculenta. P. luculenta can utilize leaves or woody materials; 50% of the population is in detritus, and 50% is in more leafy habitats, but not far from detritus. The distribution of each species from September through March depends on the amount of preferred habitat space available. Larvae in leafy habitats are washed downstream during the spring thaw by habitat displacement. In 1971, two-thirds of the P. gentilis population and nearly half the P. luculenta population were displaced. The subsequent shortage of leafy habitat space and crowding of remaining larvae may result in competitive interaction and predation by grackles. In the laboratory, both species feed preferentially on leaves that decay quickly, especially on leaves infected with fungi. Dry weights of leaf tissue ingested per larva in 24 hours frequently exceed 50% of the dry body weight of the larva. P. luculenta ingests less leaf material if twigs are available. The niche size of P. gentilis is smaller than that of the P. luculenta. There is some niche overlap, but it apparently does not normally result in harmful competition between the species. NITROGEN METABOLISM IN THE SEA.
Lamont Geological Observatory, Palisades, N.Y.

Available from the National Technical Information Service as COO-3222-2, $3.00 in paper copy, $1.45 in microfiche. Technical Progress Report, October 31, 1972. 249 p, 20 fig, 14 tab, 9 ref, 3 append. Contract No AEC-AT (11-1)3222.

Descriptors: *Radioactivity techniques, *Nitrogen, *Phytoplankton, *Zooplankton, *Metabolism, Sea water, Primary productivity, Water quality, Sampling, Systematics, Nets, Sieves, Nitrates, Nitrites, Ammonia, Silicates, Dissolved oxygen, Hydrogen ion concentration, Water temperature, Salinity, Alkalinity, Nutrients, Carbon, Cultures, Copepods, Dinoflagellates, Phosphates, Food chains, Absorption, Cycling nutrients, Amphipoda, Marine algae, Protozoa, Invertebrates, Marine animals, Crustaceans, Larvae, Mollusks, Gastropods, Diatoms.
Identifiers: N-15, Pteropods, Chaetognaths, Appendicularia, Siphonophores, Medusa, Euphausiids, Macroinvertebrates, Coelenterates, Tunicates, Nitrogen radioisotopes, Decapods, Coccolithophores, Sample preservation, On board analysis, Chaetoceros simplex, Monochrysis lutheri, Coccolithus huxleyi, Artemia salina.

A combination of daily measurement of standing stocks and rates derived from N-15 uptake experiments was used in determining rates of nitrogen flux during the initial stages of the annual increase in productivity at a station off Bermuda. The nitrogen flux during the first stage of the annual nitrogen cycle was chosen for examination. Samples were collected daily for a period of three weeks. Standing stock measurements of all particulate nitrogen from 0.45 - 10,000 microns were made on samples collected with water bottles and plankton nets. Measurements of dissolved inorganic nitrogen, other nutrients, salinity, and temperature were made on samples taken with water bottles equipped with reversing thermometers. Three preliminary experiments were done with N-15-labeled phytoplankton to measure the rate of nitrogen transfer from primary producers to herbivores. A program was initiated to collect and maintain zooplankton cultures for continuation of N-15 tracer studies under laboratory conditions. It was concluded that both methods should be used to understand the nitrogen flux in an ecosystem. The standing stock method is at the lower limits of its sensitivity when production and changes in standing stock are small. The N-15 method may be used more successfully under such conditions. (Mortland-Battelle)

A REPORT ON BACTERIAL POLLUTION AFFECTING SHELLFISH HARVESTING IN NEWPORT RIVER, NORTH CAROLINA.
Environmental Protection Agency, Athens, Ga. Surveillance and Analysis Div.

Available from the National Technical Information Service as PB-215 291, $3.00 in paper copy, $1.45 in microfiche. Report, April 1972. 43 p, 10 fig, 11 tab, 11 ref, 2 append.

Descriptors: *Water pollution effects, *Water quality standards, *Water analysis, *Water pollution sources, *Shellfish, *Shellfish farming, Tributaries, Domestic wastes, Waste disposal, Coliforms, Treatment facilities, Estuaries, Waste water treatment, E. Coli, Chlorination, Water sampling, Bioindicators, Biochemical oxygen demand, Suspended solids, Carbon, Nitrogen, Organic matter, Dyes, Soil analysis, Water pollution, Water quality, Septic tanks, Chlorine, Enteric bacteria, Sediments, Chlorides, Phosphorus, Chemical oxygen demand, *North Carolina.
Identifiers: *Newport River (NC), Fecal coliforms, Fecal pollution, Fecal streptococci, Grease, Salmonella bredeney, Salmonella reading, Salmonella anatum, Salmonella muenchen.

An intensive bacteriological monitoring program has been conducted in shellfish harvesting areas of the Newport River in North Carolina. Levels of bacterial indicators in the river's estuary and tributaries are reported and where possible, sources of the indicators are identified. Two treatment plants were major domestic waste sources but it was determined that if they operated continuously at the same efficiency as during the study they did not pose an immediate threat to shellfish growing areas. Other sources of contamination identified were wildlife, agricultural runoff, and septic tanks. In those areas of the River classified for shellfishing, each station monitored was in violation of the established criteria of the USPHS standard (median total coliform not to exceed 70/100 ml and not more than 10 percent exceed an MPN of 230/100 ml). THE ROLE OF PAPER MILL ADDITIVES AS POTENTIAL STREAM POLLUTANTS,
Washington State Univ., Pullman. Coll. of Engineering.
J. C. Sheppard.
Available from NTIS, Springfield, Va., as RLO-2221-T-3-3; $4.00 in paper copy, $1.45 in microfiche. Report RLO-2221-T-3-3, Feb. 1973. 33 p, 15 fig, 1 tab, 4 ref. AEC-AT (45-1)-2221 Task 3.

Descriptors: *Pulp wastes, *Pulp and paper industry, *Neutron activation analysis, *Environmental effects, Sedimentation basins (Waste disposal), Zinc, Titanium, Water pollution sources, Organic compounds, Carbon radioisotopes, Tracers, Radioisotopes, Radioactivity techniques, Effluents, *Path of pollutants.

Neutron-activation analysis was used in determining the fate of TiO2 and ZnO in an operating paper mill. Analysis of low levels of Ti in the effluents indicated that most Ti was recycled before reaching the final clarifier. Clay filler bleached with Zn hydrosulfite retained the Zn such that soluble Zn was not present in the effluent. The use of C14 labelling to trace organic additives is suggested since attempts to tag them with metal ions were found to have limitations. A microtome-sectioning, neutron-activation method was used to determine the distribution of additives in paper, and preliminary experiments indicated that the conjunctive use of ion-scattering at paper surfaces may be useful. Analysis of paper for clay filler using an (Am241)-Be source was not better than the conventional ashing method. (Bopp-ORNL)

TERRESTRIAL PLANT ECOLOGY.
Battelle-Pacific Northwest Labs., Richland, Wash. Ecosystems Dept.

Available from NTIS, Springfiled, Va., as BNWL-1970, Vol. 1, Pt. 2; $4.00 paper copy, $1.45 microfiche. In: Report BNWL-1750, Vol 1, Pt 2, March 1973, Section 7. 11 p, 4 fig, 5 tab, 20 ref.

Descriptors: *Grasslands, *Semiarid climates, *Water utilization, *Fertilization, Forecasting, On-site data collections, Cycling nutrients, Absorption, Phosphorus, Phosphorus radioisotopes, Sulfur, Hydrogen ion concentration, Soil contamination, Radioactivity, Lysimeters, Nuclear wastes, Ecology, Radioecology, Plant growth, Washington.

Soil disturbances from wildfires or radioactive-waste burial tend to be stabilized by cheatgrass colonization. Cheatgrass appears to be more efficient in utilizing soil water and nutrients than the native safegrass and bunchgrass. Data collected over 4 yr permits predicting the effect of nitrogen fertilizer on cheatgrass growth as a function of the moisture, nitrate, and ammonia present in the soil. The soil in the vicinity of the canopy spread of the shrub halophyte greasewood is enriched in sodium by leaf drop, also in P and S, and the pH is increased. These changes reduced uptake of Zn65, P32, and S35 by barley shoots but did not affect uptake of Ca45. Small lysimeters were used to study water use by herbage. (Bopp-ORNL)

FRESHWATER ECOLOGY.
Battelle-Pacific Northwest Labs., Richland, Wash. Ecosystems Dept.

Report available from NTIS, Springfield, Va., as BNWL-1750, Vol. 1, Pt. 2; $4.00 in paper copy, $1.45 microfiche. In: Report BNWL-1750, Vol 1, Pt 2, March 1973, Section 6. 26 p, 10 fig, 10 tab, 11 ref.

Descriptors: *Radioactivity effects, *Tritium, *Absorption, *Thermal pollution, Freshwater fish, Invertebrates, Algae, Rainbow trout, Radioecology, Food chains, Food webs, Nuclear wastes, Infection, Fish diseases, Organic compounds, Path of pollutants, Water pollution effects.

Uptake of tritium from 1 microCurie/liter of tritiated water solution reached a maximum in about 5 months in tissues of most aquatic organisms. Organically bound tritium was 7-21% of the total in mussel, crayfish, carp, and filamentous algae; 4-12% in emergent vegetation. One month after termination of the experiment, only trace activities were measured in most tissues, but 30-40% of their label was retained by filamentous algae and emergent vegetation; after 8 months, 10% was retained by vegetation. In continuing studies on (sublethal) effects of chronic low-level irradiation, the immune capacity of juvenile and yearling rainbow trout against a naturally occurring bacterial antigen was suppressed following tritium irradiation during embryogenesis. Combined effects of temperature and other environmental stresses on fish and invertebrates were studied. (Bopp-ORNL)

Report available from NTIS, Springfield, Va., as BNWL-1750, Vol. 1, Pt. 2; $4.00 in paper copy, $1.45 microfiche. In: Report BNWL-1750, Vol 1, Pt 2, March 1973, Section 5. 6 p, 2 fig, 14 ref.

Descriptors: *Mercury, *Water analysis, *Suspended solids, *Soil-water-plant relationships, Path of pollutants, Columbia River, Seasonal, Grasslands, Grazing, Mathematical models, Forecasting, Soil moisture, Soil temperature, Carbon cycle, Carbon dioxide, Soil gases, Thermal pollution, Water pollution, Runoff.

Spring grazing over a 2-year period reduced carbon dioxide evolution from soil, probably by reduction of root respiration. A preliminary model correlated seasonal changes in carbon dioxide evolution with soil temperature (20 cm) and soil moisture (0-8 cm), both for grazed and ungrazed soils. Hg in water and suspended matter from the Columbia River and its tributaries was measured over a one-year period. Hg in suspended matter was highest during the winter periods of relatively low-water levels and minimum terrestrial runoff. Concentrations in sediments behind dams were lower than in suspended matter from the same locations. (Bopp-ORNL)

MARINE SCIENCES.
Battelle-Pacific Northwest Labs., Richland, Wash. Ecosystems Dept.

Report available from NTIS, Springfield, Va., as BNWL-1750, Vol. 1, Pt. 2; $4.00 in paper copy, $1.45 microfiche. In: Report BNWL-1750, Vol 1, Pt 2, March 1973, Section 3. 8 p, 5 fig, 4 tab, 10 ref.

Descriptors: *Thermal pollution, *Radioactivity effects, *Marine fish, *Oysters, Fish eggs, Tritium, Effluents, Washington, Estuarine environment, Pacific Coast Region, Lethal limit, Oceanography, Trace elements.

Effects from canal discharge of powerplant cooling water were assessed in two types of experiment: (1) Lethal temperature were determined (28-31 degrees) for various rates of heating of marine fish (0.2-2 degrees/min) collected near shore and acclimated to 10 degrees, and (2) lethal exposure times (10-100 min) were determined at 26-30 degrees. Oyster eggs were exposed for 48 hr in seawater containing 0.01-1 microCurie/ml of tritium (the calculated dose was 0.0038-0.54 rads). There was no effect on egg development. Participation in the Geochemical Ocean Sections Study is reviewed. (Bopp-ORNL)

Report available from NTIS, Springfield, Va., as BNWL-1750, Vol. 1, Pt. 2; $4.00 in paper copy, $1.45 microfiche. In: Report BNWL-1750, Vol 1, Pt 2, March 1973, Section 2. 8 p, 1 fig, 3 tab, 5 ref.

Descriptors: *Nuclear wastes, *Vegetation, *Absorption, *Food chains, Public health, Path of pollutants, Monitoring, Soil bacteria, Chelation, Soil fungi, Soil microorganisms, Actinomycetes, Cytological studies, Soil contamination, Nevada, Organic compounds, Analytical techniques, Radioactivity techniques, Anaerobic bacteria, Sampling, Optimization, Statistics.

Sampling designs were formulated to inventory soil for Pu at Enewetok Atoll and the Nevada Test Site. Complexing with processing chemicals generally increased uptake of Nevada-Test-Site vegetation from contaminated soil in the case of Np and Pu, but decreased uptake of Am and Cm. Apparatus was designed to expose plants to Pu aerosols and maintain them in environmental chambers. Plant uptake of Cs137 was much greater from organic mud than predicted from data for simply contaminated soil. Effects will be studied of Pu on soil bacteria, actinomycetes, fungi, and soil respiratory activity. Methods were developed for determination of Pu in plant and microbial tissues and soils and for the distribution of Pu in microbial exocellular solution and within the cell. (Bopp-ORNL)

RADIONUCLIDE DECLINE IN COLUMBIA RIVER WATER.
Battelle-Pacific Northwest Labs., Richland, Wash. Radiological Sciences Dept.

Report available from NTIS, Springfield, Va., as BNWL-1751, Vol. 2, Pt. 2; $5.45 in paper copy, $1.45 microfiche. In: Report BNWL-1751, Vol 2, Pt 2, p 81-84, April 1973. 3 tab, 4 fig.

Descriptors: *Sediments, *Sedimentation, *Radioisotopes, *Columbia River, Nuclear wastes, Path of pollutants, Cores, Sediment transport, Deposition (Sediments), Radioactivity techniques.

Shutdown of the original Hanford production reactors has greatly reduced radionuclide discharge to the Columbia River; however, resuspension of radionuclides in sediments will continue for several years. Decreases in several radionuclides were measured between August 1971 and September 1972 in water sampled at McNary Dam (Sc46, 90-fold; Zn65, 9-fold; Mn54, 6-fold); but only small decreases for long-lived radionuclides (Co60, Cs137, and Eu152). The transport of eight gamma emitters (totalled) past Bonneville Dam decreased 10-fold between the fall of 1971 and the fall of 1972. In agreement with a prediction from the Zn65/Co60 ratio in sediment cores obtained earlier, examination of recent cores showed deposition of 15 cm between April 1971 and February 1972 in McNary Reservoir. (Bopp-ORNL)

DETERMINATION OF AG, HG, AND ARSENIC IN SEAWATER.
Battelle-Pacific Northwest Labs., Richland, Wash. Radiological Sciences Dept.

Report available from NTIS, Springfield, Va., as BNWL-1751, Vol. 2, Pt. 2; $5.45 in paper copy, $1.45 microfiche. In: Report BNWL-1751, Vol 2, Pt 2, p 24-28, April 1973. 2 tab.

Descriptors: *Analytical techniques, *Water analysis, *Trace elements, Mercury, Silver, Arsenic, Neutron activation analysis, Spectrophotometry, Chemical precipitation, Chemical reactions, Oxidation-reduction potential, Oxidation, Reduction (Chemical), Sea water, Pollutant identification.

The precision of an ion exchange-neutron activation method for Ag was about 10% at a concentration of 0.01 unit (micrograms/liter). The Hg in a 100-ml sample of seawater was reduced with Sn (Cl)2 and measured in a 3-cm-diameter x 17-cm-long optical absorption cell. A several day treatment of the seawater with oxidizing agent converted non-ionic to ionic forms, increasing the yield on reduction with Sn (Cl)2. The precision was about 10% at a concentration of 0.05 unit. The As in a 100 ml sample was coprecipitated with Fe (OH)3, dried, and analyzed by neutron activation. The precision was about 5% at a concentration of 1.8 units (the average found in ocean depth profiles). Ag in surface waters ranged from 0.0035 to 0.047 unit. Hg in a single surface sample from the Oregon coast was 0.011; at a depth of 50 meters, 0.049. (Bopp-ORNL)
W73-13346

IRON-55 IN THE HUMAN POPULATIONS OF THE WORLD.
Battelle-Pacific Northwest Labs., Richland, Wash. Radiological Sciences Dept.

Report available from NTIS, Springfield, Va., as BNWL-1751, Vol. 2, Pt. 2; $5.45 in paper copy, $1.45 microfiche. In: Report BNWL-1751, Vol 2, Pt 2, p 47-49, April 1973. 1 tab.

Descriptors: *Iron, *Sea water, *Marine animals, *Phytoplankton, Radioactivity techniques, Crustaceans, Marine fish, Analytical techniques, Chemical precipitation, Fallout, Nuclear wastes, Food chains, Public health, Path of pollutants, Pacific Coast Region, Atlantic Ocean, Atlantic salmon, Pacific Ocean, Salmon, Pacific Northwest U.S.
Identifiers: Iron radioisotopes.

The rate of decline of Fe55 in salmon paralleled that in the stratosphere. It is tentatively concluded that a 10-30 fold lower Fe55 specific activity in surface-feeding fish for midlatitudes as compared with northern latitudes (although the Fe55 content of the seawater is higher) results from a higher stable Fe content of the seawater. The analytical technique for concentrating Fe from large volumes of seawater consisted in coprecipitation with MnO2. In several marine animals from the Washington and Oregon coasts the Fe55 specific activity ranged from 0.4 to 1800 disintegrations/(minute, mg Fe); in plankton, 600. (Bopp-ORNL)

FATE AND EFFECTS OF RADIONUCLIDES IN ALASKA.
Battelle-Pacific Northwest Labs., Richland, Wash. Radiological Sciences Dept.

Report available from NTIS, Springfield, Va., as BNWL-1751, Vol. 2, Pt. 2; $5.45 in paper copy, $1.45 microfiche. In: Report BNWL-1751, Vol 2, Pt 2, p 10-11, April 1973.

Descriptors: *Arctic regions, *Alaska, *Radioisotopes, *Food chains, Absorption, Public health, Fallout, Lichens, Mosses, Radioecology, Mammals, Big game, Food webs, Terrestrial habitats, Radioactivity effects, Environmental effects, Ecology, Cold regions.
Identifiers: Sodium radioisotopes, Cesium radioisotopes.

Radionuclides transferred through the lichen-caribou-man food web that are found in soft tissue include Na22 and Cs137, which account for most of the dose to an Arctic resident; and also Fe55, Zn65, Ag110m and Po210. Those removed from further transport by deposition in bone are Mn54, Sr90, Pb210, and Ra226. The contribution of lichen and moss to the radionuclide content of food webs is somewhat lower in moose-forest ecosystems than in caribou-Arctic ecosystems. The shorter-lived radionuclides are more important for the moose-forest ecosystems. (Bopp-ORNL)

ANNUAL SCIENTIFIC REPORT 1971 (RADIOACTIVE AND NON-RADIOACTIVE CONTAMINATION OF THE ENVIRONMENT AND THE METABOLISM OF SOME RADIOELEMENTS; RADIOPHYSICAL CONTROL; RESEARCH ON BODY CONTAMINATION; WASTE DISPOSAL RESEARCH; N ON--RADIOACTIVE ENVIRONMENTAL POLLUTION).
Centre d'Etude de l'Energie Nucleaire, Mol (Belgium).

Report available from NTIS, Springfield, Va., as EURFNR-1063; $10.60 in paper copy, $1.45 microfiche. In: Report EURFNR-1063, 1972. Section 3, p 55-58 and Section 4, p 1-7. 2 tab.

Descriptors: *Nuclear wastes, *Waste water treatment, *Radioecology, *Milk, Freshwater fish, Food chains, Path of pollutants, Soil-water-plant relationships, Ion exchange, Ion transport, Absorption, Strontium radioisotopes, Tritium, Cobalt radioisotopes, Pastures, Sediments, Marine algae, Lead, Mercury, Toxicity, Public health, Potable water.
Identifiers: Ruthenium radioisotopes, Manganese radioisotopes.

After contamination of pastures by Ru106 as chloride, fixation on organic and fine-mineral soil fractions at 0-5 cm depth was greater than by sand at lower depth. Soil water collected in lysimeters did not change in Ru106 activity with depth. Uptake of Sr85 by plants increased with increasing organic matter in soils, and decreased with increasing clay. Milk from cows fed with hay from contaminated pastures was 10-20 times higher in tritium as compared with milk from cows given tritiated water. The uptake of tritium by marine algae was studied, as was the uptake of Mn54 and Co60 by freshwater fish, moss, and sediment. The uptake of various Ru salts by freshwater organisms was also studied. Pilot-plant-scale studies were made of nuclear waste decontamination by ion exchange. Removal of Pb and Hg from wastes by FeS precipitate in ion-exchange columns was tested. The toxicity of Pb in drinking water is being studied. (Bopp-ORNL)

COPPER ACCUMULATION IN SOILS USED FOR HOP GROWING IN BAVARIA, (IN GERMAN),
Technische Hochschule, Munich (West Germany).
W. Rieder, and U. Schwertmann.
Landwirtsch Forsch. Vol 25, No 2, p 170-177. 1972. English summary.
Identifiers: *Copper, Fungicides, *Germany (Bavaria), Growing, Iron, Manganese, Soils, *Wheat (Hop growing).

Due to the extensive use of Cu-containing fungicides, Cu is highly accumulated in these soils. Topsoil of 8 profiles with 7-16% clay contained more than 500 ppm total Cu after up to 43 yr of fungicide applications. The annual accumulation averaged 12.1 ppm Cu. Practically no Cu reached the groundwater. Of the Cu accumulated, 90% was soluble in 0.05 M EDTA or 0.43 N HNO3 both commonly used for the extraction of 'plant available' Cu. Exchangeable Cu increased from <1 ppm to 7 ppm Cu. The relationship between pCu (exchangeable) and pH was linear between pH 4.5-6.5 with a slope pCu/pH of approximately 0.5 indicating a reaction between one Cu2+ and 2 H+. Liming the soil above pH 6.5 does not seem to reduce the exchangeable Cu significantly. Native total Cu was highly correlated with clay ($r \pm 0.975$) and total Fe ($r \pm 0.985$). A Neubauer experiment with summer wheat indicated no detrimental effect of a high Cu content in the soil but compared to a normal soil the uptake of Fe and particularly of Mn by the plant was significantly reduced.--Copyright 1973, Biological Abstracts, Inc.

CONTENTS OF TRACE ELEMENTS IN LUCERNE (MEDICAGO VARIA MART) IN RELATION TO GROWTH, DEVELOPMENT AND WEATHER CONDITIONS IN 3 YEARS OF EXPERIMENT, (IN GERMAN),
Technische Universitaet, Munich (West Germany). Institut fuer Gruenlandlehre.
G. Voigtlaender, V. Lang, and M. Kirchgessner.
Z Acker-Pflanzenbau. Vol 135, No 3, p 204-215. 1972. Illus. English summary.
Identifiers: Cobalt, Copper, Growth, Iron, *Lucerne clone, Manganese, Medicago-Varia, Milk, Molybdenum, Radiation, Temperature, *Trace elements, Weather, Zinc.

The initial growth of a lucerne clone was analyzed from the beginning of growth to full flowering for its content of Co, Mo, Cu, Mn, Zn and Fe. The results of the analyses and the corresponding data for temperature, rainfall and radiation were analyzed by factor analysis and multiple regression analysis. With increasing plant age the content of Mo, Cu, Zn, Mn, and Fe diminished. Higher total values for radiation and temperature were associated with higher contents of Mo and Cu but with lower contents of Mn. The requirements of Fe and Mo in a milk cow were met throughout the growth period. The Cu and Zn contents fell below the required concentration when the height reached 50 cm. The Mn contents remained below the normal requirements throughout. In the majority of cases a deficiency in the supply of Co is also to be expected.--Copyright 1973, Biological Abstracts, Inc.

SURVEY OF ENVIRONMENTAL RADIOACTIVITY, JANUARY 1-DECEMBER 31, 1972,
Ames Lab., Iowa.
M. D. Voss.
Available from NTIS, Springfield, Va., as Report No IS-3048; $4.00 per paper copy, $1.45 microfiche. Report No IS-3048, Feb 1973. 44 p.

Descriptors: *Environmental control, *Radioactivity, *Measurement, *Radioisotopes, *Assay, Effluent, Nuclear powerplants, Rivers, Air pollution, Water pollution, Soil contamination, Sediments, Vegetation, Fallout, Precipitation (Atmospheric), Ponds, Streams, *Iowa.
Identifiers: Skunk River (Iowa), Squaw Creek (Iowa).

The environmental monitoring program of the Ames Laboratory of the USAEC including the Ames Laboratory Research Reactor (ALRR) is described. The environmental program consists of determinations of gross alpha and beta radioactivity in air, soil, vegetation, river water, ALRR outfall, bottom sediment, precipitation, well water, and pond water samples. Off-site environmental air is routinely monitored at a station atop the Research Building, Iowa State University campus, Ames, Iowa. The alpha and beta radioactivity in stream water was determined upstream and downstream from the confluence point of streams forming the drainage pattern from the ALRR. There is no measurable radioactivity in the stream water samples attributable to Ames Laboratory operations. (Houser-ORNL)

Descriptors: *Carbon radioisotopes, *Carbon dioxide, *Calcium carbonate, Hardness (Water), Calcite, Nutrient cycling, Boron, Calcium, Atmosphere, Air pollution effects, Water pollution effects, Mixing, Marine biology, Oceans, Chemical precipitation, Chemistry of precipitation, Ions, Absorption, Turnovers, Mathematical models, Public health, Fossil fuels, Nuclear powerplants, Tracers, Forecasting, Future planning (Projected), Ecology, Radioecology, Oceanography.

Absorption of CO2 from burning fossil fuel is predicted to cause the mixed layer of the oceans to become unsaturated with respect to calcium carbonate, by the year 2010 in one model and well into the next centruy by a second To avoid harm to calcarious organisms, leveling off fuel consumption by the year 2000 should be considered. The first model is based on the controversial hypothesis of free absorption of carbon dioxide; the second model is based on limitation of absorption by ionic equilibria. The first model is supported both by the observation in the atmosphere of only about one-third the annual carbon dioxide emission from fuel, and by the decrease of C14 in tree rings. (Bopp-ORNL)

Identifiers: *Hanford site (Wash).

Publications prepared by Hanford staff scientists that deal with bioenvironmental studies in the central Columbia River during the period 1945 to 1971 are listed and abstracted. Four general topics are covered: (1) biology and ecology of river organisms, (2) thermal and chemical effects of reactor effluent discharges, (3) radioactivity releases from reactor operations, and (4) hydrology of the Columbia River. Over 400 publications are included. The abstracts provide an insight into the scope and depth of diverse studies supported by the United States Atomic Energy Commission in order to evaluate any impact on the aquatic ecosystem throughout the 'plutonium production phase' of the Hanford operations. RADIOACTIVE WASTE MANAGEMENT - A BIBLIOGRAPHY OF PUBLICLY AVAILABLE LITERATURE PERTAINING TO THE USAEC'S HANFORD, WASHINGTON PRODUCTION SITE.
Technical Information Center (AEC), Oak Ridge, Tenn.

Available from USAEC, Tech Inf Center, Oak Ridge, Tenn., as Report TID-3340. Free. Report No. TID-3340, Aug 1973. 160 p, 1098 ref.

Descriptors: *Bibliographies, *Abstracts, *Radiation, *Radioactive wastes, *Radioactive waste disposal, Management, Washington, Meteorology, Ecology, Hydrology, Radioecology, Water pollution, Water pollution sources, *Columbia River, Groundwater, Surface waters, Monitoring, Assay, Public health, Administrative agencies.
Identifiers: *Hanford site (Wash).

This bibliography contains abstracts of 1098 technical reports and journal articles which have appeared in Nuclear Science Abstracts from January 1951 through July 1973 pertaining to radioactive waste management at the Hanford site. The abstracts are grouped into ten categories. Within the categories, they are arranged by NSA volume and abstract number and cover subjects as follows: (1) Environmental monitoring, ecology and radiological surveys, (2) Columbia River studies, (3) Ground disposal and soil studies, (4) Geology, hydrology, and meteorology, (5) Stack disposal, (6) Waste storage tanks and corrosion problems, (7) Waste fixation and solidification, (8) Waste processing and properties, (9) Waste management, (10) Miscellaneous. Recent classification reviews by the AEC have resulted in the declassification of additional documents not yet processed for inclusion in Nuclear Science Abstracts or yet made publicly available. A supplement to this bibliography will be issued in the near future when necessary processing has been completed. (Houser-ORNL)

Identifiers: *Cesium radioiosotopes.

This review compares in-situ tests with pot studies. The correlation of Cs with K in vegetation found in pot studies was masked by the effect from variations in the K content of the soil encountered in the field. With both sandy and loamy soils transfer coefficients from soil to plants were 2-3 times less in in-situ than in pot studies when the concentration of available Cs in the soil was more than 1%, but the two types of studies were in better agreement at lower Cs concentration. Irrigation increased Cs uptake in in-situ studies since fixation of Cs by soil was decreased and root contact with suspended particles containing sorbed Cs was increased. The correspondence was found that a fallout value of 1 millicurie Cs137/sq km gave 4 picoCuries/kg in arable soil and 12 picoCuries/kg in prairie soil. Cs uptake by leafy vegetables was affected more by soil moisture and seasonal factors than uptake by wheat. (Bopp-ORNL)

After surface disposal of solutions containing radionuclides, radioactivity penetration into the soil was measured using instruments placed in pipes (see W72-00942 for prior work). Most I131 was retained near the surface, and washing by nonradioactive solutions removed only a small part. However, retention was reduced by the presence of NaI in solution (0.01 N) such that I131 could be used as a tracer of the front of water diffusion. Generally Sr85 sorption was much stronger than that of I131; however the presence of stable Sr and Ca in solution reduced Sr85 retention, and soil could be decontaminated of sorbed Sr85 by washing with solutions containing sufficient Ca. The effect of soil moisture on the radioactivity measurements was determined. (Bopp-ORNL)

PLANT ACCUMULATIONS OF RADIOACTIVE STRONTIUM WITH SPECIAL REFERENCE TO THE STRONTIUM-CALCIUM RELATIONSHIP AS INFLUENCED BY NITROGEN,
Danish Atomic Energy Commission, Risoe. Research Establishment.
A. J. Andersen.

Available from NTIS, Springfield, Va., as RISO-278; $5.45 in paper copy, $1.45 in microfiche. Report RISO-278, Jan 1973. 56 p, 4 fig, 6 tab, 100 ref.

Descriptors: *Soil-water-plant relationships, *Strontium radioisotopes, *Food chains, *Soil contamination effects, Radioecology, Path of pollutants, Fallout, Fertilization, Nitrates, Calcium, Soil properties, Legumes, Forage grasses, Phosphates, Agronomy, Absorption, Europe, Agriculture, Lime, Oats.
Identifiers: *Denmark.

A 10-year study of factors affecting Sr90 uptake by plants is summarized. Uptake varies between species but is generally higher for legumes than grasses. Uptake from heavy clay loam may be only 0.1 that from light sandy soil of low pH. Deep plowing may reduce uptake by shallow-rooted plants from 2- to 5-fold with loamy soil. Most Denmark soils have high Ca so that lime application proves ineffective; however phosphate application reduces uptake, possibly in part by forming Sr phosphates. There is little effect from K and Mg in fertilizer, but nitrate is a nutritional factor that affects the ability of plants to discriminate between Sr and Ca. Nitrate decreased the Sr/Ca ratio in oat plants grown both in water culture and in soil in pots. (Bopp-ORNL)
W73-13418

A SIMPLE MODEL OF STRONTIUM AND MANGANESE DYNAMICS IN A TROPICAL RAIN FOREST,
Argonne National Lab., Ill.
C. F. Jordan, J. R. Kline, and D. S. Sasscer.
Health Physics, Vol 24, p 477-489, May 1973. 7 fig, 5 tab, 20 ref.

Descriptors: *Fallout, *Strontium radioisotopes, *Rain forests, *Radioecology, Nuclear explosions, Excavation, *Path of pollutants, Runoff, Cycles, Public health, *Mathematical models, Computer models, Digital computers, Computer programs, Forecasting, Soil-water-plant relationships, Decomposing organic matter, *Puerto Rico, Absorption.
Identifiers: Manganese radioisotopes.

The fate of fallout radionuclides (including the case of an acute injection from the use of thermonuclear devices for excavations) was predicted by modelling measurements of Sr and Mn fluxes in ecosystem compartments. Measurements of fallout radionuclides in the forest validated the model. The turnover time of Sr90 was affected, in order of decreasing sensitivity, by the flow from litter to soil, the flow from canopy to litter, and rate of runoff. The shorter half-life for radioactive decay made Mn54 (312 days) more sensitive than Sr90 (28.8 years) to the quantity in the canopy, but the turnover time of Mn 54 was relatively insensitive to other parameters of the model. Radioactive decay is about three times as important as runoff in the elimination of Sr90 and accounts for 99% of the elimination of Mn54. The Sr90 activity in wood peaks about 12 years following a peak in fallout deposition. (Bopp-ORNL)
W73-13419

DISTRIBUTION OF CS137 IN SOILS AND VEGETATION ON THE ISLAND OF PUERTO RICO,
Argonne National Lab., Ill.
J. R. Kline, J. A. Colon, and S. S. Brar.
Health Physics, Vol 24, p 469-475, May 1973. 4 fig, 20 ref.

Descriptors: *Fallout, *Radioisotopes, *Rainfall, *Puerto Rico, Plants, Absorption plant physiology, Mountain forests, Ferns, Mosses, Lichens, Cycling nutrients, Public health, *Path of pollutants, Radioecology, Absorption.
Identifiers: *Cesium radioisotopes.

Only Ce144, Cs137, Mn54, and Zr95-Nb95 were detected by gamma spectroscopy in most samples in significant amounts, and only Cs137 is discussed in this report because of the similarity of distribution of the other nuclides (see also W73-04303). Levels in epiphytic plants (bromeliads, ferns, mosses, lichens, and liverworts) that derive their mineral nutrient requirements by interception of aerosols averaged 4.8 times those in most rooted plants. However, the hypothesis that aerosol scavenging by plants gave a major contribution to fallout interception was rejected except at localized mountain summit sites that are little used for agricultural production. The decrease in Cs137 going from the eastern to the western part of the island is accounted for by rainfall scavenging of atmospheric aerosols. (Bopp-ORNL)

DIETARY INTAKE OF COBALT BY THE ADULT POPULATION OF TARAPUR,
Tarapur Atomic Power Station (India).
I. S. Bhat.
Health Physics, Vol 24, p 553-554, May 1973. 3 tab, 9 ref.

Descriptors: *Cobalt radioisotopes, *Cobalt, *Nuclear wastes, *Food chains, Public helath, Asia, Soils, Vegetable crops, Foods, Diets, Trace elements, Path of pollutants, Water pollution sources.
Identifiers: *India (Tarapur).

Dietary intake of Co was determined as one of the elements whose radioisotopes may be released in effluents from nuclear powerplants. Intake by the Tarapur population is 65% from cereals, 22% from seafood, and the remainder from vegetables, meat, and milk. The average daily intake of 254 micrograms/day is comparable with that in the United States; however, in the United States 35% is from meat and milk, 35% from cereals, 12% from sea food, and the remainder from vegetables. The low Co content of the volcanic soils of Japan results in a 10-fold lower content in vegetables as compared with Tarapur and the United States, where the content of vegetables is comparable. (Bopp-ORNL)
W73-13426

ON THE WIND-DRIVEN CIRCULATION OF A STRATIFIED OCEAN,
University of East Anglia, Norwich (England). School of Mathematics and Physics.
J. A. Johnson.
Journal of Marine Research, Vol 29, No 3, p 197-213, 1971. 5 fig, 10 ref.

Descriptors: *Ocean circulation, *Theoretical analysis, *Thermal stratification, *Mathematical models, *Winds, Oceanography, Hydrography, Temperature, Velocity, Model studies, Solar radiation, Wind velocity.

Various similarity solutions have been used to represent the depth variation in temperature and velocity fields of the theory of circulation in the thermal layer of the ocean. The main limitation to these solutions concerns the choice of boundary conditions at the surface when there is an applied wind stress and heat input. The ocean has been divided into an Ekman layer, a thermal layer and an almost isothermal abyssal layer. Theoretical consideration is given to the conditions under which the driving of circulation by wind-stress is important, and the Ekman-layer suction is matched to the vertical velocity in the thermal layer. The results for an applied zonal wind stress are given. Comparison of the calculated temperature field with observed temperature distributions is satisfactory. Upwelling may still be necessary in coastal boundary layers even when there is no component of wind stress parallel to the coast and hence no Ekman-layer flux away from the coast. Horizontal advection was found to be more important than horizontal diffusion of heat in determining the surface temperature distribution. (Jerome - Vanderbilt)

DYNAMIC COOLING.

Technology Review, Vol 73, No 7, p. 54-55, May 1971. 2 fig.

Descriptors: *Ohio River, *Thermal pollution, *Forecasting, *Computer programs, Water quality, Water quality control, Model studies, Mathematical models, Cooling, Rivers, Data processing, Computer programs, Computer models, Electric power production, Thermal power plants, Hydrothermal studies, Heat transfer, Heat balance.
Identifiers: COLHEAT-studies.

The COLHEAT computer program, developed by the Pacific Northwest Laboratories of Battelle Memorial Institute, is a method of determining the cooling capacity of a river, based upon a multiplicity of parameters. In application to the streams of the Ohio River Basin, this program predicted that thermal loads will exceed cooling capacity by some time between 1984 and 1990. The standard upon which this program was based was that quantity of heat which could be assimilated by any stream and then dissipated to the atmosphere within a stream envelope of 5 F above background. Since the cooling capacity of the streams varies significantly depending on the season, the COLHEAT program shows that power demand will exceed cooling capacity during the summer in the Allegheny River watershed by 1980. Similar conditions exist in other areas. In such cases present cooling capacity must be supplemented with cooling towers and ponds. (Jerome-Vanderbilt)
W73-13449

MEASURING THERMAL PLUMES IN THREE DIMENSIONS,
Westinghouse Electric Corp., Pittsburgh, Pa.
L. L. Simmons, and J. A. Nutant.
Power Engineering, Vol 75, No 10, p. 44-45, October 1971. 2 fig.

Descriptors: *Thermal pollution, *Temperature, *Jets, Distribution patterns, Sampling, Monitoring, Thermometers, Heated water, Thermal powerplants, Water quality, Mixing, Density.
Identifiers: *Thermal plumes, Sensors, Thermistors.

Determining the three-dimensional distribution of waste heat in a thermal plume can be done by either a portable or a fixed system. With either, temperatures must be recorded as functions of surface dimensions, depth and time. The fixed system must be positioned carefully in the study area to assure that it actually does measure the desired water parameters. Data are recorded for retrieval or telemetered into a central receiver. Portable systems can use either remote or in-situ sensing. Remote sensing relies on infrared radiation detection through overflights or from land-based scanning units. In-situ sensing may be done with temperature-dependent resistance elements called thermistors. These thermistors can be placed at pre-determined levels on an electro-mechanical cable which is lowered from a boat at desired locations. (Oleszkiewicz-Vanderbilt)

SIMPLIFIED METHOD FOR DETERMINING TOWER DRIFT RATE,
K. Juris.
Industrial Water Engineering, p. 30-31, April/May 1972. 2 fig.

Descriptors: *Cooling towers, *Mathematical models, *Evaporation, *Dissolved solids, Water cooling, Design, Condensation, Water loss, Model studies, Computer models, Flow rates.
Identifiers: *Spray ponds, Drift rates, Cooling ponds.

A simplified method is presented which only requires the measurement of the dissolved solids concentration of make–up water and recirculated hot water to determine drift rates from mechanical and natural draft cooling towers and spray ponds. The circulating, evaporation, drift, make-up and blowdown water flows constitute the flow of water through a closed cycle cooling system. When blowdown flow is shut off, the concentration of dissolved solids in the recirculating water increases until a constant value is reached when the rate of dissolved solids escaping in the drift of the tower equals the rate of dissolved solids entering in the form of make-up flow. The rate of concentration of dissolved solids in the circulating and make-up water is indirectly related to the drift rate. A high ratio indicates a low drift rate and a low ratio indicates a high drift rate. An example of this relationship is presented. Since a high ratio may present some problems it is advised to perform the experiments when the dissolved solid content of the make-up water is low and in the winter when the evaporation rate would be less. A computer program of the situation could be developed using the usual cooling tower design parameters and the climatological parameters of dew point, dry bulb and source water temperatures as input data. WATER POLLUTION AND ASSOCIATED EFFECTS FROM STREET SALTING,
Edison Water Quality Research Lab., N. J.
R. Field, E. J. Struzeski, Jr., H. E. Masters, and A. N. Tafuri.
Copy available from GPO Sup Doc as EP1.23/2:73-257, $0.85; microfiche from NTIS as PB-222 795, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-257, May 1973. 48 p, 28 fig, 11 tab, 109 ref.

Descriptors: Environmental effects, *Highway icing, Groundwater, Corrosion, Water pollution effects, Runoff, *Snow removal, Water supply, *Deicers, *Melting, Heating.
Identifiers: *Hydrophobic substances, *Salt storage, Stormwater runoff.

A state-of-the-art review is presented of highway deicing practices and associated environmental effects. The bare pavement policy has resulted in a great increase in the use of deicing salts. They are more efficient and economical than abrasives. However, there is excessive application leading to environmental problems. Besides chemical melting, various methods for deicing exist. Some of these are stationary and mobile thermal melting units, alternate deicing compounds, snow adhesion reducing pavements, electromagnetic energy for ice shattering, and drainage systems designed to capture snowmelt for treatment or control. Salt storage facilities often become a major contributing source of local groundwater and surface water salt contamination. Coverage of salt piles is becoming more prevalent. Types of enclosed structures are illustrated, and cost considerations given. High chloride concentration levels have been found in roadway runoff. The special additives in deicing salts may create more severe pollutional problems than the chloride salts. Serious groundwater contamination has occurred in many locations, for example, Maine, Massachusetts, New Hampshire, and Michigan. Widespread damage of roadside soils and vegetation has been observed in areas of liberal salt usage. (EPA)

Descriptors: *Model studies, *Estuaries, *Thermal pollution, *Temperature, Water quality, Water quality control, Mathematical models, Simulation analysis, Coasts, Finite element analysis, Density, Salinity, Heat balance, Hydrologic equation, Mixing, Surface waters, Data collections, Date processing.

A water-quality simulation model for well mixed estuaries and coastal seas has been developed. It is based on the numerical solution, by finite difference techniques of the two-dimensional vertically integrated equations of motion and continuity for fluid. Recently, a heat transport model has been incorporated into this simulation model to make it useful in analyzing thermal effect problems. Heat is regarded as a dissolved constituent, and the practical heat equation is identical to the mass transport equation. The arrangement of the equation enables one to fully account for temperature-dependent processes such as reaeration, coliform die-away, dissolved oxygen, biochemical oxygen demand, reaction coefficient, and dissolved oxygen saturation concentration by making reaction rates temperature dependent. The external sources or sinks of thermal energy into the waters of a bay or estuary are mainly through surface heat exchange processes and large thermal discharges from power plants. These sources can be accounted for in the model. The model is now being used in studies of Jamaica Bay, Long Island, New York, and Tampa Bay, Florida. (Jerome - Vanderbilt)

EFFECTS OF HIGHWAY DE-ICING SALTS ON GROUNDWATER AND WATER SUPPLIES IN MASSACHUSETTS,
Geological Survey, Boston, Mass.
S. J. Pollock, and L. G. Toler.
Highway Research Record, No 425, p 17-22, 1973. 3 fig, 3 ref.

Descriptors: *Deicers, *Water pollution sources, *Massachusetts, *Salinity, Path of pollutants, Chlorides, Groundwater, Observation wells, Monitoring, Snow removal.
Identifiers: *Road salting.

The concentration of chloride in some public water supplies has increased significantly during the last few years. This increase corresponds to the increased use of salts for de-icing highways. In some localities, the concentration of chloride has increased beyond the 250 mg per liter recommended by the U.S. Public Health Service as an upper limit for drinking water supplies. In 1965, a program was begun to monitor the concentration of chloride in groundwater along state highways in Massachusetts. Initially, 10 sites were selected to represent various types of geologic materials along old and new highways. At most sites, two wells were installed, one at 15 ft and one at 30 ft from the highway. At one site, 12 wells were installed at several depths and distances for the highway. All wells were on the downgrade side of the highway with respect to the water table. Samples were collected from each well periodically and analyzed for chloride. The concentration of chloride in normal, uncontaminated groundwater in eastern Massachusetts is about 5 to 15 mg per liter. Chloride concentration in the aquifers at the test sites near highways and analyses of water from wells near heavily salted highways and salt storage sites indicate that a significant part of the salt applied to roadways is entering the groundwater system (Knapp-USGS)

EFFECTS OF PHOSPHORUS APPLICATION RATE, SOIL PROPERTIES, AND LEACHING MODE ON P-32 MOVEMENT IN SOIL COLUMNS,
Ohio State Univ., Columbus.
T. J. Logan, and E. O. McLean.
Soil Science Society of America Proceedings, Vol 37, No 3, p 371-374, May-June 1973. 2 fig, 2 tab, 13 ref.

Descriptors: *Leaching, *Phosphates, *Water pollution sources, *Fertilizers, Path of pollutants, Adsorption, Solubility, Nutrients, Nutrient removal.
Identifiers: *Phosphorus fixation.

Movement of monocalcium phosphate labeled with P-32 was investigated in column experiments with application rate, fixation capacity, and mode and intensity of leaching as variables. Three soils of contrasting texture and fixation capacity were studied. Leaching of P increased with application rate and intensity of leaching. Constant head leaching resulted in greater movement of P-32 out of the surface layer and greater accumulation in the leachate than intermittent leaching. In general, P 32 recovered in the leachate was nonionic except in instances where maximum leaching occurred. Significant amounts of P-32 were recovered in the leachate only with sandy loam soil and at the highest application rate. (Knapp-USGS)

BEHAVIOR OF DETERGENTS (ABS), BACTERIA, AND DISSOLVED SOLIDS IN WATER-SATURATED SOILS,
Geological Survey, Denver, Colo.
H. G. Page, C. H. Wayman, and J. B. Robertson.
Geological Survey Professional Paper 450-E, p E179-E181, 1962. 2 fig, 1 tab, 7 ref.

Descriptors: Filtration, *Detergents, E. Coli, *Surfactants, Bacteria, Clogging, *Soil filters, Tracers, *Sewage effluents, *Alkylbenzene sulfonates, Treatment, Permeability, Porosity, Water pollution control.
Identifiers: Methylene-blue, Agar, Colloidal alumina.

The comparative effectiveness of a coarse-grained, a fine-grained, and a colloid-coated soil in removing ABS, dissolved solids, and bacteria from sewage effluent was determined under saturated-flow conditions. Coarse sand and sandy loam removed about 90 percent of the bacteria from sewage within a few feet of travel, but additional travel did not remove all the remaining bacteria. Dissolved solids and detergent (ABS) content virtually were unaffected by filtration of saturated flow. Because bacterial clogging occurred quickly in fine-grained soils, coarser sand was preferred as a pollution filter for the removal of bacteria. (Campbell-NWWA)

GROUND-WATER CONTAMINATION AND LEGAL CONTROLS IN MICHIGAN,
M. Deutsch.
Geological Survey Water Supply Paper 1691, 79 p. 23 fig.

Descriptors: *Michigan, *Groundwater resources, Legal aspects, *Pollution abatement, Freshwater, Water wells, Well regulations, Saline water encroachment, Industrial wastes.
Identifiers: *Groundwater contamination, Hydrologic studies, Regional surveys.

The great importance of the fresh ground-water resources of Michigan is evident because 90 percent of the rural and about 70 percent of the total population of the State exclusive of the Detroit metropolitan area are supplied from underground sources. Manmade and natural contaminants, including many types of chemical and organic matter, have entered many of the numerous aquifers of the State. Industrial and domestic wastes, septic tanks, leaking sewers, flood waters or other poor quality surface waters, mine waters, solids stored or spread at the surface, and even airborne wastes all have been sources of ground water contamination in Michigan. In addition, naturally occurring saline waters have been induced into other aquifers by overpumping or unrestricted flow from artesian wells, possibly by dewatering operations, and by the deepening of surface stream channels. Vertical migration of saline waters through open holes from formations underlying various important aquifers also has spoiled some of the fresh ground waters in the State. In spite of the contamination that has occurred, however, the total amount of ground water that has been spoiled is only a small part of the total resource. Overall legal authority to control most types of ground-water contamination in the State has been assigned by the Michigan Legislature to the Water Resources Commission, although the Department of Conservation and the Health Department also exercise important water-pollution control functions. (Campbell-NWWA)

EFFECT OF THE RATE OF APPLICATION AND THE VOLUME OF APPLIED WATER ON THE RATE OF MOBILITY OF CERTAIN INSECTICIDES IN CLAY SOIL,
Ain Shams Univ., Cairo (Egypt). Faculty of Agriculture.
M. S. El-Rafie, and Z. H. Zidan.
Bull Entomol Soc Egypt Econ Ser. 5. p 85-94. 1971.
Identifiers: *Clay soils, Heptachlor, *Insecticides, Mobility, Residues, Sand, Soils, Temik, Water pollution sources, *Path of pollutants.

The effect of 3 successive doses and 3 volumes of applied water on the rate of mobility of heptachlor, Di-Syston and Temik was studied in 2 types of soil (i.e., sand and clay soil), under laboratory conditions, in individual glass tubes. Residues were chemically analyzed in 5 separated layers of each experimental tube and in the leach. The effects on the rates of binding within the top layer, the rates of distribution within the 2nd to the 5th layers and the rates of leach were taken as a criterion.--Copyright 1973, Biological Abstracts, Inc.

DESTRUCTION OF ORGANIC SUBSTANCE IN OOZE DEPOSITS, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
V. I. Romanenko, and S. I. Kuznetsov.
Mikrobiologiya. Vol 41, No 2, p 356-361. 1972. Illus. English summary.
Identifiers: *Ooze deposits, *Organic destruction, Reservoirs, Substances, *Sediment deposition, Aerobic conditions.

The analysis of the circulation of organic substance in water reservoirs requires the determination of the degree of destruction of organic substances sedimented from water into ooze deposits. The method of determination of aerobic and anaerobic decomposition of organic substances are described and the results of determinations of bottom deposits in the Rybinsk reservoir are presented. During the vegetative period of 1968, 111 mg C m2/day of organic substance was decomposed by aerobic processes and in 1969, 205 mg C m2/day. Individual determinations showed that 40% of the total mineralized organic substance/day was decomposed under anaerobic conditions.--Copyright 1973, Biological Abstracts, Inc.

RADIOACTIVE FALLOUT IN RAIN AT MELBOURNE, 1958 THROUGH 1970,
Commonwealth Scientific and Industrial Research Organization, Appendale (Australia). Div. of Atmospheric Physics.
B. B. Hicks.
Tellus. Vol 24, No 3, p 277-281. 1972. Illus.
Identifiers: *Australia (Melbourne), *Radioactive fallout, *Rain, Measurements.

Gross beta-activity measurements were analyzed from the point of view of the annual cycle in the lower troposphere. The annual cycles found in rainfall concentration of radioactive fallout and in the total fallout deposition peak at different times; the former in Dec. and the latter in Aug. The difference was explained in terms of the variation in rainfall. A phase difference was apparent between cycles and in situ stratospheric data, suggesting that ground level air lags behind the stratophere by about 1 or 2 mo.--Copyright 1973, Biological Abstracts, Inc.

LOADING THE RHINE WITH ORGANIC POLLUTANTS, (IN GERMAN),
Kernforschungszentrum, Karlsruhe (West Germany). Institut fuer Radiochemie.
W. Koelle, H. Ruf, and L. Stieglitz.
Naturwissenschaften, Vol 59, No 7, p 299-305. 1972. Illus. English summary.
Identifiers: Carbon, Chlorine, DDE, Fish, *Germany (Rhine River), Mercury, Organic loading, Pollutants, Pesticides.

The organic pollution of the Rhine is discussed using overall analyses like total organic C, organic Cl and radiocarbon dating. Fish of Lake Constance and the Rhine were analyzed for unpolar petrochemicals and Hg. They showed an increasing enrichment of hydrocarbons, chlorinated benzenes, chlorinated biphenyls and DDE along the flow of the Rhine. The maximum content of organic Cl in the fat was 340 ppm and of Hg in muscle tissue, 1.32 ppm.--Copyright 1973, Biological Abstracts, Inc.

THE OCCURRENCE AND DISTRIBUTION OF MERCURY IN THE SEDIMENTS OF PETIT LAC (WESTERN LAKE GENEVA),
Geneva Univ. (Switerzerland). Dept. of Geology.
J-P., Vernet, and R. L. Thomas.
Eclogae Geol Helv. Vol 65, No 2, p 307-316. 1972. Illus.
Identifiers: Contamination, Distribtution patterns, Industrial wastes, Lakes, *Mercury, Petit Lac, *Sediments, Switerzerland (Lake Geneva), *Lake sediments.

Hg analyses of surface sediments from the Petit Lac (western Lake Geneva) gave values ranging from 24-1274 ppb with a mean of 622 ppb representing an increase in concentration at least 3 times above natural levels. The contaminant Hg to Lake Geneva is derived from industrial sources in the upper Rhone River draining into the eastern part of the lake (Grand Lac) with subsequent transportation in association with fine sediments particles to the Petit Lac. In the Petit Lac the Hg enriched sediment is dispersed by current activity with sedimentation occurring predominantly in 3 deeper water sub-basins. From correlation analysis the Hg is adsorbed by amorphous, hydrated iron oxides with complexed phosphorus which occurs as a coating on individual clay mineral particles.--Copyright 1973, Biological Abstracts, Inc.

LEVELS OF MERCURY IN THE SEDIMENTS OF SOME SWISS LAKES, INCLUDING LAKE GENEVA AND THE RHONE RIVER,
Geneva Univ (Switzerland) Dept of Geology
J-P Vernet and R. L. Thomas
Eclogae Geol Helv Vol 65, No 2, p 293-306, 1972 Illus
Identifiers *Lake Geneva, Lakes *Mercury, *Rhone river, Sediments, *Switzerland

Sediment samples taken from Lakes Bienne, Brienz, Joux, Tuma, Saoseo, Bodan and Geneva were analyzed for total Hg Other than Lake Brienz all of the lakes show some evidence of Hg contamination from atmospheric or industrial/municipal sources with levels of Hg above the accepted background level of 200 ppb The most southeasterly lakes, Tuma and Saoseo, show the effect of the precipitation of atmospheric Hg derived from the industrial complexes of Northern Italy. Higher levels are observed in Lake Saoseo than in Lake Tuma due to its geographic location relative to prevailing westerly and southwesterly winds. Sediment Hg concentration profiles in the Rhone River identify 3 canal systems, X, Y and Z and the La Drance tributary as the sources of industrial Hg contamination of the Rhone River and Lake Geneva. Repetitive sampling from 1964-1971 suggests that significant industrial input to the Rhone River commenced between 1965 and 1967 and has increased annually to 1971.--Copyright 1973, Biological Abstracts, Inc.

COMPARISON OF POLLUTION DEGREE OF FLUVIAL WATERS EVALUATED BY MEANS OF THE BOD5 TEST AND A SAPROBIOLOGICAL METHOD,
Water Economics Research Inst., Wroclaw (Poland). Water Protection Research Section.
S. Golowin.
Pol Arch Hydrobiol, Vol 18, No 4, p 381-391, 1971, Illus.
Identifiers: Biological studies, Biosestin, Effluents, *Fluvial waters, Method, Mill, Oxygen, Pollution, *Saprobiological method, Sugar, *Poland (Silesia), *BOD5, Biochemical oxygen demand.

Investigations of 3 rivers in Lower Silesia, Poland, helped establish correlations between saprobity of bioseston and biological O2 demand (BOD5) values. The correlations were different for each river, and for changing degrees of pollution they were different for the same river at different seasons. The correlations were almost identical for different rivers subject to identical or similar influences (2 rivers exposed to similarly purified sugar-mill effluents). Thus, saprobity was not an absolute and direct measure of the state of pollution of a river, but it was a measure of an individual reaction of biocenosis of a given river to pollution or its change. Saprobity did not hinder the comparison of 2 polluted rivers, or even the same river in different test seasons. A reaction of a set of saprobes to an increase of pollution depended on the degree of adaptation of the set to heavier concentrations of organic substances vulnerable to decomposition. The degrees of adaptation were expressed by a curve defining the relationship between saprobity and BOD5. A steep slope was an evidence of a better adaptation of biocenosis. A better adaptation was expressed by a strong increase in alpha-meso and polysaprobes related to small increases of BOD5 in comparison with a river with nonadapted biocenosis.--Copyright 1973, Biological Abstracts, Inc.

EXPERIMENTAL INFORMATION FOR SUBSTANTIATING THE MAXIMAL PERMISSIBLE CONCENTRATION OF ISOPROPYLBENZOL HYDROGEN PEROXIDE IN BODIES OF WATER (IN RUSSIAN),
Nauchno-Issledovatelskii Institut Gigieny, Moscow (USSR).
R. D. Smirnova, and L. F. Kos'mina.

Gig Sanit, Vol 36, No 12, p 17-19, 1971, English summary.
Identifiers: *Hydrogen peroxide, Maximal permissible concentration, *Organoleptic properties, Water pollution sources.

The threshold concentrations of isopropylbenzol hydrogen peroxide judged by its effect on the organoleptic properties of water, the general sanitary regimen, and its inefficient sanitary-toxicologic dose were determined by means of complex hygienic investigations. The smallest value of the 3 indices (0.025 mg/kg of 0.5 mg/l) is suggested as the maximum permissible concentration of isopropylbenzol in water bodies.--Copyright 1973, Biological Abstracts, Inc.

SOLUBILITY OF MANGANESE IN THE PRESENCE OF SOIL CHEMICALS,
Rhode Island Univ., Kingston.
L. K. Wang.
M. S. Thesis, 1967. 110 p, 21 fig, 24 tab, 48 ref.

Descriptors: Groundwater, *Soils, Erosion, Sedimentation, *Manganese, Hydrogen Ion Concentration, Chemicals, Water pollution sources, *Solubility, *Organic acids, *Chelation.
Identifiers: Manganese monoxide, Manganese dioxide, Tartaric acid, Succinic acid, Citric acid, Acetic acid, Oxalic acid, Lactic acid, Organometallic complexes.

Organic acids, such as tartaric acid, succinic acid, citric acid, acetic acid, oxalic acid, and lactic acid, would form soluble complexes with the manganese monoxide and manganese dioxide and could therefore be partially responsbile for the solution and transport of manganese in ground water. The laboratory determinations demonstrated that these six organic acids are effective chelating agents capable of complexing with manganese. The relative ability of these organic acids to chelate with manganese to form a soluble product is in the following decreasing order: citric, acetic, oxalic, succinic, lactic, tartaric. The organometallic complexation of manganese is pH dependent. A decrease of pH will increase the level of soluble manganese in ground water. The temperature effect on the solubility of manganese was measurable, but not very significant. When microorganisms are present in ground water, biological activity also influences the solubility of manganese. Generally, biochemical reduction in anaerobic ground water causes reducing conditions which will release manganese to solution; however, biological oxidation may render dissolved manganese insoluble and cause precipitation.

5C. Effects of Pollution

STUDIES ON THE INTERACTIONS OF BACTERIA AND NEMATODES,
Auburn Univ., Ala. Dept. of Botany and Microbiology.
G. R. Wilt, M. M. Joshi, and J. Metcalf.
Available from the National Technical Information Service as PB-222 494, $4.25 in paper copy, $1.45 in microfiche. Alabama Water Resources Research Institute Bulletin 10, 1973. 89 p, 30 fig, 15 tab, 11 ref. OWRR A-016-ALA (3).

Descriptors: *Nematodes, *Bacteria, *Viruses, *Bacteriophage, *Pseudomonas, Predation, Migration patterns, Oxygen requirements, Invertebrates, Microorganisms.
Identifiers: Pelodera, Vibrio, Chromobacterium, Agarbacterium.

Interactions of microbes common to water resources were investigated. Nematodes were able to distinguish between food bacteria and non-food bacteria, and between bacteria and lake bottom mud. They preferentially migrated to and fed on a Vibrio species at various distances, temperatures, and pH values. Migration to food bacteria increased with an increase in bacterial concentration. Resting and dead bacteria did not attract nematodes. Nematodes migrated to food bacteria even when they had to move into areas having reduced oxygen tensions or under a barrier to reach bacteria. Nematodes were not attracted by carbon dioxide. They did migrate, however, to a dialysate from food bacteria. Nematode predation resulted in greater reductions in viable numbers of bacteria than total numbers of bacteria. Interactions between bacteria and bacteriophage occurred under a variety of temperature and pH values. The bacterium-phage interaction seemed to be more sensitive to extremes in temperature and pH values than either associate by itself. P. aeruginosa in the presence of its phage utilized oxygen at a greater rate than in the absence of phage. Nematodes were observed to disseminate bacteriophage over a surface seeded with host bacteria.

THE EFFECTS OF ENRICHMENT ON LAKE SUPERIOR PERIPHYTON,
Wisconsin Univ., Eau Claire. Dept. of Allied Health.
R. R. Nelson, T. O. Odlaug, B. O. Krogstad, O. R. Ruschmeyer, and T. A. Olson.
Available from the National Technical Information Service as PB-222 498, $5.25 in paper copy, $1.45 in microfiche. University of Minnesota, Water Resources Research Center, Minneapolis Bulletin 59, May 1973. 182 p, 60 fig, 19 tab, 219 ref. OWRR B-020-MINN (3). 14-31-0001-3095.

Descriptors: *Periphyton, *Nutrients, *Lake Superior, Productivity, *Minnesota, Algae, *Phosphates, *Nitrates, Water pollution effects.
Identifiers: Complete nutrient media, Control pools, Test pools.

Two natural rock basins were constructed at the lakeside along the north shore at Castle Danger, Minnesota for the purpose of exposing naturally grown and regrowth periphyton to higher-than-normal levels of phosphate and nitrate. At weekly intervals during 1969 and 1970, samples were collected and productivity was measured by enumeration of organisms, chlorophyll analysis, and weight (dry and organic). Lake Superior periphyton responds dramatically to increased additions of phosphorus and nitrogen. If the nearshore area of Lake Superior ever received nutrients, such as those added to the experimental test pool at Castle Danger, a drastic change in the Lake's biota could occur. For example, as enrichment increased, the predominant clean-water diatom forms could eventually be replaced by the more tolerant green or blue-green algae. In addition, the very composition of the macrobenthic forms found in Lake Superior could be altered as a result of their dependence on the periphyton, which, as primary producers, from the first link in the food chain. Likewise, certain fish which depend on benthic organisms for their food may be adversely affected as an indirect result of a changing periphyton community. (Walton-Minnesota)

THERMAL EFFECTS ON EGGS, LARVAE AND JUNVENILES OF BLUEGILL SUNFISH,
Aquatic Sciences, Inc., Boca Raton, Fla.
Arnold Banner, and Joel A. Van Arman.
Copy available from GPO Sup Doc as EP1.23:73-041, $2.10; microfiche from NTIS as PB-222 625, $1.45. Environmental Protection Agency Ecological Research Series Report EPA-R3-73-041, May 1973. 111 p, 2 fig, 7 tab, 88 ref. EPA Contract No 14-12-913, Project No. 18050GAB.

Descriptors: *Thermal stress, *Sunfishes, *Water temperature, Fish reproduction, Fish eggs, Larvae, Growth stages, Fish juveniles, Temperature control, Fish management, Fishkill, Spawning, Aquatic environment, Water pollution effects, Thermal pollution, Bioassay.
Identifiers: *Bluegill sunfish, Fish spawning induction.

Bioassay experiments were conducted to determine thermal tolerance of early life history stages of bluegill sunfish. Bluegill eggs hatched at temperatures from 18 to 36C during two incubation tests. Maximal hatch occurred at 22.2 and 23.9C. Lower TL50 temperature for hatch of normal fry was 21.9C and upper TL50 temperature was 33.8C. Juvenile bluegills acclimated to 12.1C had a lower 96-hour TL50 of 3.2C and an upper 96-hour TL50 of 27.5C. Juveniles acclimated to 32.9C had a lower 96-hour TL50 of 15.3C and an upper 96-hr TL50 of 37.3C. TL50 increased with increasing temperature of acclimation. For juveniles acclimated to a given temperature, upper TL50 decreased with longer exposure. A preliminary test determined ranges of thermal tolerance for sac-fry and swim-up fry. In another prelinary test, juvenile bluegills were acclimated to 12.1, 19.0 26.0 or 32.9C, and reared at a series of test temperatures for three to six wks. to define optimal temperature ranges for growth and survival. Additional research determined conditions for the culture of Lepomis macrochirus, including spawning induction, hatching, and growth of larvae and juveniles. (EPA)
W73-13020

EFFECTS OF COPPER ON THE LOCOMOTOR ORIENTATION OF FISH,
Texas A and M Univ., College Station. Dept. of Biology.
H. Kleerekoper.
Copy available from GPO Sup Doc as EP1.23:73-045, $1.25; microfiche from NTIS as PB-222 596, $1.45. Environmental Protection Agency, Ecological Research Series Report EPA-R3-73-045, June 1973. 97 p, 18 fig, 10 tab, 54 ref. EPA Project 18050 DWQ. R800995.

Descriptors: Channel catfish, Suckers, Sunfishes, Bass, *Copper, Fish, Water temperature, Ions, Fish behavior, Water pollution effects, Gradients (Stream).
Identifiers: Goldfish, White sucker, Green sunfish, Lepomis cyanellus, Carassius auratus, Micropterus salmoides, *Fish locomotion, Avoidance behavior (Fish).

The effects of copper ions at subacute concentrations on the locomotore orientation of goldfish (Carassius auratus), channel catfish (Ictalurus

punctatus), largemouth bass (Micropterus salmoides), white sucker (Catostomus commersoni commersoni) and green sunfish (Lepomis cyanellus) were investigated in detail. In regions of water containing 11-17 micrograms/l Cu++ (as CuCl2) in a shallow gradient goldfish oriented toward the copper source ('attraction'). This response is reduced in a somewhat steeper gradient. In steep gradients significant but no absolute avoidance behavior occurred. Whether the response will be 'avoidance' or 'attraction' seems to depend on the slope of the gradient to which the fish is exposed. Even in steep gradients, the 'avoidance' behavior is reversed to 'attraction' when the copper ions interact with a temperature slightly higher (.4C) than that of the surrounding copper free water. The interaction creates a new stimulus configuration which is different from those formed by the two variables separately. The orientation of the largemouth bass is not affected by copper ions at the concentrations tested. Channel catfish are weakly attracted by the copper-containing water and green sunfish significantly increase time spent there. Suckers significantly but not absoletely 'avoid' such water through changes in turning behavior. (EPA)

INTERACTION BETWEEN MARINE ORGANISMS AND OIL POLLUTION,
Woods Hole Oceanographic Institution, Mass.
M. Blumer, J. M. Hunt, J. Atema, and L. Stein.
Copy available from GPO Sup Doc as EP1.23:73-042, $1.25; microfiche from NTIS as PB-222 628, $1.45. Environmental Protection Agency, Ecological Research Series EPA-R3-73-042, May 1973. 97 p, 18 fig, 5 tab, 11 ref. EPA Project 18080 EBN and 10850 EBN.

Descriptors: Behavior, *Oil wastes, Analytical techniques, Gas chromatography, *Degradation (Decomposition), *Path of pollutants, *Lobsters, *Organic compounds, *Oil pollution, Water pollution effects, Water pollution sources.

Part I of this project has established that fossil hydrocarbons can be distinguished from biogenic hydrocarbons in living organisms. Hydrocarbons are stable in marine organisms and sediments and can move unaltered through several trophic levels. Only very low levels of organic stimuli are necessary for chemical communication--a mechanism especially prone to interference by pollutants. Part II has established that a low level of crude oil (0.9 milliliters/liter) interferes with the timing of feeding behavior in the lobster (Homarus americanus). Water soluble fractions (in the 50 ppb range) did not affect feeding behavior. Added oil reduced the lipids as well as alkane and alkene-aromatic content of aquaria. Degradation of added oil followed the usual pathways of evaporation, dissolution, oxidation, polymerization, and metabolism. (EPA)

ACUTE EFFECTS OF ADMINISTRATION OF METHYL MERCURIC CHLORIDE ON TISSUES AND ENZYME ACTIVITY IN CHANNEL CATFISH (ICTALURUS PUNCTATUS),
Louisville Univ., Ky. Dept. of Anatomy.
M. W. Kendall.
PhD Dissertation, May 1972. 101 p, 39 fig, 2 tab, 35 ref. OWRR-A-038-KY (2).

Descriptors: *Mercury, *Catfishes, *Water pollution effects, *Pathology, *Toxicity, Public health, Fish management, Fish farming, Enzymes, Fish, Inhibitors.
Identifiers: *Methyl mercury, Fish physiology.

In Kentucky and neighboring southeastern states, the channel catfish is being extensively cultured as a food crop. Acute exposure to methyl mercuric chloride causes enzyme and tissue alterations. The principal reaction of absorbed mercury is to bind thiols, forming mercury mercaptide. The ultimate effect of mercury and its compounds is based upon its ability to inhibit enzymes. In the channel catfish, a single intraperitoneal injection of 15 mg/kg methyl mercuric chloride caused deposition of mercury in liver, kidney, skeletal muscle, and gill. Marked pathology was evidenced by necrosis in the liver, necrosis of pancreatic tissue within portal venous walls, necrosis of renal tubular cells and marked thickening of renal glomerular basement membrane. The principal effects on enzymes were facilitation of acid phosphatase, alkaline phosphatase, and leucine aminopeptidase and inhibition of succinic dehydrogenase and oxygen consumption. A lower dosage of 1.5 mg/kg methyl mercuric chloride produced no structural alterations but did produce changes in enzyme activity. These alterations in tissues and enzyme activity are indicative of acute methyl mercuric chloride intoxication in the channel catfish. (Knapp-USGS)

AQUATIC ORGANISMS AND HEAVY METALS IN MISSOURI'S NEW LEAD BELT,
Missouri Univ., Rolla.
N. L. Gale, B. G. Wixson, M. G. Hardie, and J. C. Jennett.
Water Resources Bulletin, Vol 9, No 4, p 673-688, August 1973. 6 fig, 6 tab, 11 ref.

Descriptors: *Lead, *Mining, *Mine wastes, *Food chains, *Water pollution effects, Path of pollutants, Algae, Aquatic animals, *Missouri, Fish, Snails, Crayfish, Heavy metals.
Identifiers: *New Lead Belt (Mo).

The New Lead Belt of southeastern Missouri has recently become the largest lead producing region of the world. Since the industrial development began, there have been a number of nuisance biological blooms in several of the small streams receiving effluent from the mines and mills. The major constituents of the problem algal growths include Cladophora, Oscillatoria, Mougeotia, Zygnema, Spirogyra, Cymbella, and a variety of other stalked and nonstalked diatoms. Secondary blooms of Sphaerotilus reach problem proportions in some streams, particularly in the autumn. Finely ground rock flour and mineral particles escaping from tailings dams are trapped by the stream vegetation. Concentrations of lead, zinc, copper, and manganese in the algal and bacterial mats are inversely related to distance downstream from the tailings dams. Consumer organisms, including crayfish, snails, aquatic insects, tadpoles, minnows and larger sunfish, were analyzed to determine the extent of dissemination and concentration of heavy metals through food chains. Insignificant concentrations of heavy metals were found in the consumer organisms studied, though in at least one problem stream the normal consumer organisms were markedly reduced in numbers. (Knapp-USGS)

EXTENSIVE OXYGEN DEPLETION IN MOBILE BAY, ALABAMA,
Alabama Marine Resources Lab., Dauphin Island.
E. B. May.
Limnology and Oceanography, Vol 18, No 3, p 353-366, May 1973. 5 fig, 1 tab, 33 ref.

Descriptors: *Estuaries, *Oxygen sag, *Water pollution effects, *Density stratification, *Alabama, Salinity, Dissolved oxygen, Anaerobic conditions, Biochemical oxygen demand, Eutrophication, Organic wastes, Waste assimilative capacity.
Identifiers: *Mobile Bay (Ala).

Extensive areas of bottom water in Mobile Bay, Alabama, suffer oxygen depletion in summer because of salinity stratification. When these water masses low in dissolved oxygen are occasionally forced against the beach, demersal fish and crustaceans migrate shoreward in a depressed or moribund state. In the absence of technical data, these occurrences, locally called jubilee provide over a century of historical evidence oxygen depletion. Oxygen depletion and jubile occurred in the bay before man physicall modified the basin, but the conditions responsib for oxygen depletion are now worse than in th past. Because of bathymetric changes and modi cations which have restricted water circulatio Mobile Bay has exceeded its capacity to assimilat its oxygen demand in summer. This has severel affected the biota of the estuary. (Knapp-USGS) W73-13065

AN AQUARIUM TEMPERATURE CONTRO SYSTEM FOR FIELD STATIONS,
New York Cooperative Fishery Unit, Ithaca.
H. A. Regier, and W. H. Swallow.
Progressive Fish Culturist, p 43-46. January, 196 2 fig, 1 tab, 2 ref. OWRR-A-013-NY (3).

Descriptors: *Temperature control, *Aquari *Fish handling facilities, Equipment, Researc facilities, Laboratories, Automatic control.

An automated and rugged system of temperatu controlled aquaria was set up to maintain a ten perature range within 0.5C. The system is capabl of maintaining constant temperature and pr grammed temperature changes. Methods, type an brand of equipment and precautions are given. (I win-Cornell)

EFFECTS OF INCUBATION TEMPERATUR ON SURVIVAL OF LARGEMOUTH BAS EGGS,
Cornell Univ., Ithaca, N.Y. Dept. of Conserva tion.
J. W. Kelley.
Progressive Fish Culturist, p 159-163. July, 1968, tab, 9 ref. OWRR-A-013-NY (6).

Descriptors: *Largemouth Bass, *Temperatur Thermal pollution, *Fish eggs, Incubation, Wate pollution effects, *Thermal stress.

Largemouth Bass eggs were taken from a natura environment and subjected to varying intensitie of temperature shock. Survival was highes between 55 and 75F, generally lower at 50 degree and 80 degrees, and lowest at 85F. The percentag of hatch of eggs acclimated to 50 degrees, 8 degrees and 85F was generally much higher tha the percentages for non-acclimated eggs incubate at those temperatures. (Irwin-Cornell)

FOOD OF LARGEMOUTH BASS (MICROP TERUS SALMOIDES) FROM A SOUTH CAROLINA RESERVOIR RECEIVING HEATE EFFLUENT,
Virginia Cooperative Fishery Unit, Blacksburg.
D. H. Bennett, and J. W. Gibbons.
Trans Am Fish Soc. Vol 101, No 4, p 650-654 1972. Illus.
Identifiers: Bass, Effluents, Heated water, *Lar gemouth bass, Lepomis-Sp, Micropterus-Sal moides, Reservoirs, *South Carolina, *Therma pollution.

Largemouth bass (Micropterus salmoides) col lected from an area of a South Carolina reservoi at ambient temperatures contained greate amounts of food than bass taken at the entrance o a heated effluent in the same reservoir. Unidentifi able fish occurred in the highest frequency at both areas; sunfish (Lepomis sp.) had the highes frequency of occurrence of all identifiable items All major dietary components were found i stomachs of bass from both areas from March through May although the relative occurrences o these items varies in the winter, spring, and fall Increased metabolic requirements on fish living i the heated portion of the reservoir, are possibly

educed by individuals entering the waters at ex-
eme temperatures to feed, followed by move-
ent to deeper, stratified waters at lower tempera-
res.--Copyright 1973, Biological Abstracts, Inc.

HE VERTICAL DISTRIBUTION OF SOME ILIATED PROTOZOA IN THE PLANKTON F A EUTROPHIC POND DURING SUMMER TRATIFICATION,
urham Univ. (England). Dept. of Botany.
. Goulder.
reshwater Biol. Vol 2, No 2, p 163-176. 1972. Il-
s.
dentifiers: *Ciliated protozoa, Distribution pat-
rns, England, *Eutrophic pounds, Loxodes-
agnus, Loxodes-striatus, Photosynthesis,
hytoplankton, Ponds, Protozoa, Stratification,
ummer, *Vertical distribution.

he vertical distribution of some ciliated Protozoa
the plankton of a pond in northwest England
as investigated during Aug. 1971. At this time,
hen the pond was stratified with an O2 deficient
ypolimnion, ciliates were counted at 10-cm depth
tervals every 5 hr over 25 hr. The most common
pecies (Loxodes magnus and L. striatus) were
onfined to the hypolimnion; there was no diurnal
igration into the epilimnion. Earlier work had
hown that Loxodes species required O2; it is
herefore possible that these ciliates, which in-
abited the O2 deficient hypolimnion, migrated
ertically, from time to time, to an O2 supply at
e boundary with the well-oxygenated epilimnion.
o test this, Loxodes populations were confined in
ellophane tubes both in the hypolimnion (at 3 m)
nd epilimnion (0.5 m) for 12 and 24 hr (earlier tri-
ls had shown that the tubes were not markedly
oxic). The ciliates died at both depths, and in a
urther experiment when Loxodes were confined
t 3 m and 0.5 m and sampled at 5-hr intervals up to
5 hr it was found that they survived longer in the
ypolimnion. It is suggested that ciliates confined
t 3 m died because they were unable to migrate
ertically to an O2 supply, while those at 0.5 m
ied because some other adverse factor was
perating in the epilimnion. Laboratory experi-
ents showed that Loxodes died in water in which
hytoplankton photosynthesis took place and it is
uggested that side effects of photosynthesis in the
pilimnion (e.g., a rise in pH) caused the death of
iliates exposed at 0.5 m.--Copyright 1973, Biologi-

ECOLOGICAL OBSERVATIONS ON THE EMERGENCE OF CERCARIAE FROM GONIOBASIS FLORIDENSIS REEVE FROM THE WEKIVA RIVER, FLA.,
Santa Fe Junior Coll., Gainesville, Fla.
G. W. Hunter, III, and E. E. Wigington.
Ecology. Vol 53, No 5, p 901-907. 1972. Illus.
Identifiers: *Cercariae, Ecological studies, *Florida (Wekiwa River), Goniobasis-floridensis, Rivers.

An 18 mo. study of the infection of G. floridensis from the Wekiva River in south-central Florida revealed that overall infection peaks appear to occur in Dec. and then again in the spring (Feb.-May). A total of 3149 specimens of G. floridensis were examined for emerging cercariae with an overall prevalence rate of 5.1%; 9% of 789 snails from station 1 and 3.8% of 2369 snails from station 2 were positive. At station 1 xiphidiocercariae were present in all 6 of the collections, strigeids in 5, pleurolophocercous in 4, and cysticercariae in 2. At station 2 the pleurolophocercous cercariae occurred in 9 collections, xiphidio in 8, strigeid in 7, and echinostome and cysticercariae in 1 each. When totals are considered, xiphidiocercariae were the most abundant, occurring in 14 collections compared with the pleurolophocercous in 13, strigeids in 12, cysticercariae in 1. Multiple infections occurred only twice: 1 snail shed 2 species of xiphidiocercariae and the other, xiphidiocercariae and pleurolophocercous cercariae. Such items as pH, dissolved O2, temperature of the water, and so forth showed no particular correlation with the overall cercarial shedding pattern.--Copyright 1973, Biological Abstracts, Inc.

COMPETITION FOR UREA AMONG ESTUARINE MICROORGANISMS,
Woods Hole Oceanographic Institution, Mass.
C. C. Remsen, E. J. Carpenter, and B. W. Schroeder.
Ecology. Vol 53, No 5, p 921-926. 1972. Illus.
Identifiers: Asterionella, Bacteria, Chaetoceros, Chlorophyll, *Estuarine microorganisms, Pollution, Rhizosolenia, Salinity, Thalassiosira, *Urea decomposition, Phytoplankton, *Georgia.

Phytoplankton were responsible for the major part of the urea decomposition in the Savannah-Wilmington-Ogeechee estuaries and adjacent coastal waters in Georgia. This is an exception to the general rule that bacteria are favored over algae in the competition for dissolved organic compounds. Filtration of estuary water through a 20 micro mesh filter did not significantly change the concentration of urea-decomposing bacteria; there was, however, a significant change in phytoplankton cell concentrations, chlorophyll a, and urea decomposition rates. Thus, any differences in the decomposition of urea in filtered and unfiltered aliquots could be attributed to the phytoplankters removed by filtration. Average cell concentrations and chlorophyll a removed by filtration were 15% and 39% of the totals, respectively. The removal of urea-composing activity averaged 53% of the total. This indicates that the phytoplankters removed by filtration, mainly diatoms with large cross-sectional areas such as Rhizosolenia, Chaetoceros, Asterionella, Thalassiosira, etc., were responsible for proportionally higher amounts of urea decomposition than would be indicated on a purely cell-numbers basis. Urea concentrations ranged from 0.6 to 8.9 micrometer, with the highest values (average 3.41 micrometer) being found in the more polluted Savannah estuary. Lower values, generally 1-2 micrometer, were observed in the Wilmington and Ogeechee estuaries. Fresh water generally had slower urea decomposition rates (average of 6.2 micrometermoles liter-1 hr-1) than brackish waters (average 19.6 micrometermoles liter-1 hr-1). Turnover time for urea, calculated from these average values, was 25 days for fresh water and 4 days for brackish water.--Copyright 1973, Biological Abstracts, Inc.

EPIDEMIOLOGICAL STUDY ON CLONORCHIS SINENSIS AROUND LAKE BIWA, SHIGA PREFECTURE: II. SURVEY ON METACERCARIA INFECTION IN FRESH-WATER FISHES AND ON HUMAN INFECTION WITH THIS PARASITE, (IN JAPANESE),
Kyoto Prefectural Univ. of Medicine (Japan). Dept. of Medical Zoology.
M. Nagahana, Y. Yoshida, K. Matsuo, K. Kondo, and K. Matsuno.
Jap J Parasitol. Vol 20, No 6, p 499-506. 1971. Illus. English summary.
Identifiers: Acheilognathus-lanceolata, Acheilognathus-rhombea, Biwia-zezera, *Clonorchis-sinensis, Epidemiological, Fishes, Gnathopogon-elongatus-caerulescens, Gnathopogon-elongatus-elongatus, Human, Infection, *Japan (Lake Biwa), Lakes, *Metacercaria, Parasites, Pseudorasbora-parva, Rhoduns-ocellatus-smithii, Sarcocheilichthys-variegatus.

During 1962-1970, 715 freshwater fishes were examined for metacercaria of C. sinensis. Those fishes were collected from 13 stations around the Lake Biwa. The metacercarial infection was found in 8 species of the fishes out of 19 species examined, those were Pseudorasbora parva, Sarcocheilichthys variegatus, Rhoduns ocellatus smithii, Gnathopogon elongatus elongatus, G. elongatus caerulescens, Acheilognathus rhombea, A. lanceolata and Biwai zezera. The infection incidence was generally high in those collected from southern part of the lake, e.g. in station 9, 92 out of 150 P. parva were infected with the metacercaria. The stool examination of man was carried out at 11 villages or towns around the lake using HCl-ethanol concentration technique between 1963 and 1966. The egg of C. sinensis was detected in 190 out of 1645 examined (11.6%). The infection rate was very low in northern parts (A and B) of the lake. It was considerably high in other parts, usually between 10-20% and in some villages more than 20%, with one exception of village K which showed 4.3%. Although the infection rate was markedly high in adult age group, the fact that 3.4% of children less than 10 yr old were positive for ova suggested the possibility of recent infections.--Copyright 1973, Biological Abstracts, Inc.

A COMPARISON OF THE ZOOPLANKTON COMMUNITIES IN SEVEN MOUNTAIN LAKES NEAR LILLEHAMMER, NORWAY (1896 AND 1971),
Norsk Institutt for Vannforskning, Blindern.
A. Langeland.
Norw J Zool. Vol 20, No 3, p 213-226. 1972. Illus.
Identifiers: Biomass, Fish, Lakes, *Norway (Mesna catchment), *Phytoplankton, Pollution, *Zooplankton.

During April, June and Aug 1971 phytoplankton and zooplankton investigations were performed in 7 mountain lakes in the Mesna catchment area near Lillehammer, Norway, and the results compared with earlier plankton investigations in 1896 (Huitfeldt-Kaas 1906). The great biomass of phytoplankton and zooplankton indicates lakes with relatively high primary and secondary production. It is assumed that this is mainly caused by natural conditions. The high ratio between phytoplankton and zooplankton biomass in some of the lakes indicates an unstable ecological equilibrium state. The qualitative and quantitative changes in the plankton community during the last 75 yr are assumed to have been caused by heavy fish predation, impoundment and pollution.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF DDT UPON SALMON FROM SCHOODIC LAKE, MAINE,
Maine Dept. of Inland Fisheries and Game, Augusta.
D. O. Locke, and K. Havey.
Trans Am Fish Soc. Vol 101, No 4, p 638-643. 1972. Illus.
Identifiers: Blueberry, *DDT, Lakes, *Maine (Schoodic Lake), *Salmon, Synergistic effect, Water pollution effects.

Schoodic Lake, a relatively large glacial kettle located in the blueberry growing area of Washington County, Maine, is in a section where pesticides have been used intensively in blueberry culture for many years. DDT was implicated as the cause of a high hatchery mortality of landlocked salmon eggs and fry from Schoodic Lake in 1968-1969. This implication prompted a controlled study in 1970 to determine more exactly the effects of the pesticide upon salmon eggs and fry with Schoodic Lake as the parental source. DDT and metabolites in salmon eggs and fry from Schoodic Lake ranged from 7.21 to 10.41 ppm as opposed to 0.28 to 1.31 ppm in control fish from West Grand Lake. The Schoodic lot had a total mortality to feeding of 66% as opposed to a 30% mortality in the West Grand Lake fish. DDT and metabolites in mature salmon from Schoodic Lake in fall, 1969 ranged from 4.03 to 12.22 ppm in contrast to a range of 0.11 to 1.03 ppm in mature salmon from West Grand Lake. DDT and metabolites in mature salmon from Schoodic Lake in fall, 1970 ranged from 3.40 to 8.76 ppm. The increased use of guthion, an organophosphate, in the Schoodic Lake area may have a detrimental synergistic effect with DDT upon fish.--Copyright 1973, Biological Abstracts, Inc.

THE EFFECTS OF METHOXYCHLOR ON FISHES: I. ACUTE TOXICITY AND BREAKDOWN STUDIES,
Michigan Dept. of Natural Resources, Ann Arbor. Inst. for Fishery Research.
J. W. Merna, M. E. Bender, and J. R. Novy.
Trans Am Fish Soc. Vol 101, No 2, p 298-301. 1972. Illus.
Identifiers: *Fathead minnows, Fish, *Methoxychlor, Perch, *Toxicity (Acute), Wetting, *Yellow perch.

The rate of breakdown of methoxychlor (a DDT substitute) in water varies considerably with the water source. The half life attributable to hydrolysis in distilled water exceeds 200 days; the half life may be as short as 1 day in water of high biological activity. Static toxicity studies were unreliable due to the rapid breakdown of methoxychlor. Continuous flow studies yielded TL50 (median tolerance limit) values of 7.5 micrograms/l for fathead minnows and 20 micrograms/l for yellow perch. These values are considerably lower than others in the literature. The difference is probably due to the use of a wetting agent to achieve better solution of methoxychlor.--Copyright 1973, Biological Abstracts, Inc.

TRENDS IN METHODOLOGY FOR EVALUATION OF EFFECTS OF POLLUTANTS ON MARINE ORGANISMS AND ECOSYSTEMS,
Fisheries Research Board of Canada, West Vancouver, (British Columbia). Pacific Environment Inst.
M. Waldichuk.
CRC-Critical Reviews in Environmental Control, Vol 3, No 2, p 167-211, February 1973. 2 fig, 3 tab, 378 ref.

Descriptors: On site investigations, *Analytical techniques, *Methodology, Evaluation, *Water pollution effects, *Ecosystems, *Reviews, *Pollutant identification, Bioassay, Laboratory tests, Marine fish, Cold-water fish, Animal physiology, Primary productivity, Secondary productivity, Laboratory equipment, Instrumentation, Growth stages, Marine algae, Marine bacteria, Crustaceans, Mollusks, Marine animals, Invertebrates, Toxicity, Lethal limit, Animal behavior, Solvent extractions, Ion exchange, Colorimetry.
Identifiers: Pollutant effects, Marine environment, Macroinvertebrates, Bioaccumulation, Data interpretation, Median tolerance limit, Electrolytic extraction, Acclimation, Petroleum hydrocarbons, Scuds, Steelhead trout, Sockeye salmon, White sucker, Species diversity, Most probable number test, Ion exchange chromatography, Gas liquid chromatography, Adsorption chromatography, Thin layer chromatography, Paper chromatography, High pressure liquid chromatography, Liquid-liquid extraction.

The literature related to biological and chemical methodology for evaluating the effects of pollutants on marine organisms is reviewed. Research findings are considered from the very pragmatic point of view and the review is an extension of the presentation on the subject made earlier. In this case, it does not cover in depth broader considerations of physiological and biochemical studies on the effects of pollutants on marine organisms, from which there is an ever-increasing literature. Also, much of the microbiological research on marine pollution has been largely unreviewed. (Mortland-Battelle)

AVOIDANCE OF PESTICIDES BY GRASS SHRIMP (PALAEMONETES PUGIO),
Environmental Protection Agency, Gulf Breeze, Fla. Gulf Breeze Lab.
D. J. Hansen, S. C. Schimmel, and J. M. Keltner Jr.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 3, p 129-133, March 1973. 3 tab, 6 ref.

Descriptors: *DDT, *Endrin, *2 4-D, Bioassay, Animal behavior, *Pesticide toxicity, Water pollution effects, Crustaceans, Chlorinated hydrocarbon pesticides, Phosphothioate pesticides, Carbamate pesticides, *Shrimp.
Identifiers: *Dursban, *Malathion, *Sevin, Avoidance, Palaemonetes pugio, Grass shrimp, Macroinvertebrates, Median tolerance limit.

The capacity of the euryhaline grass shrimp, Palaemonetes pugio, to avoid water polluted by DDT, endrin, Dursban, malathion, Sevin, or 2,4-D was evaluated. Grass shrimp were sieved from ponds and acclimated for at least 5 days in the laboratory at 20 percent salinity and 20 C. Avoidance was tested by allowing the shrimp to move from a holding area into one of two section, one with pesticide polluted water and the other with unpolluted water. Light was excluded during experiments. It was assumed, and corroborated in preliminary tests, that in the absence of pollutants the shrimp would enter the two areas with equal frequency. Chi-square tests were used to analyze the results. The shrimp avoided 1.0 and 10.0 ppm concentrations of the herbicide 2,4-D but did not avoid any of the five insecticides. Given a choice between two concentrations of 2, 4-D, they chose the lower concentration. The data suggest that shrimp may be extremely vulnerable to pesticide pollution because they are very sensitive to pesticides and are unlikely to avoid water polluted by them. (Mortland-Battelle)

INORGANIC NITROGEN REMOVAL FROM WASTEWATER: EFFECT ON PHYTOPLANKTON GROWTH IN COASTAL MARINE WATERS,
Woods Hole Oceanographic Institution, Mass.
J. C. Goldman, K. R. Tenore, and H. I. Stanley.
Science, Vol 180, No 4089, p 955-956, June 1, 1973. 1 fig, 1 tab, 9 ref.

Descriptors: *Nitrogen, Waste water treatment, *Phytoplankton, Growth rates, *Bioassay, Marine algae, *Tertiary treatment, *Nutrient removal, Sea water, Nutrient requirements, Nutrients, Ponds, Eutrophication, Phosphorus, Limiting factors, Water pollution control, Efficiencies, Chrysophyta, Plant growth.
Identifiers: Pollutant removal, *Algal growth potential, Coastal waters, Chaetoceros simplex.

Algal bioassays were used to demonstrate the high efficiency of a combined tertiary wastewater treatment and marine aquaculture system in removing inorganic nitrogen, and to show that the coastal waters off Woods Hole, Massachusetts, are limited in nitrogen for marine phytoplankton growth. When nutrients were removed from secondarily treated domestic wastewater through assimilation by phytoplankton in an outdoor growth pond, the pond effluents, in varying dilutions with seawater, could not support more phytoplankton growth than the seawater alone. However, when nitrogen was added back to the mixtures of pond effluent and seawater, the phytoplankton growth response was similar to that with a mixture of wastewater and seawater. This is similar to the findings of other researchers, and suggests that nitrogen may be the key growth-limiting nutrient in many coastal marine waters. The combined tertiary treatment-marine aquaculture system appears to be an effective means of removing nitrogen from secondarily treated wastewater and controlling eutrophication of coastal marine waters. (Mortland-Battelle)

ntifiers: *Species diversity index, *Feedlot ru- ff, *Macroinvertebrates, Data interpretation, eches, Turbellaria, Species diversity, covery, Repopulation, Cottonwood River, gs, Sphaerium, Isonychia, Paraleptophlebia, dropsyche, Cheumatopsyche, Stenelmis, Fin- nail clam, Black flies, Ameletus, Caenis, Pota- ia, Hydroptilia, Ithytrichia, Chironomus, ypedilum, Simulium, Moths, Alderflies, Dam- flies.

e effect of feedlot runoff on the environmental ality of the Cottonwood River in east central nsas was evaluated by analysis of community ucture of benthic macroinvertebrates using the cies diversity index, (d bar). The benthic fauna ng the study reach was dominated by mayflies, idisflies, midges, riffle beetles, and the ecypod, Sphaerium. Sixty-five taxa were ntified during the study; the benthic fauna was st abundant during the 1968-69 segment of the dy. However, the mean species diversity index station indicated the river was subject to derate environmental stress, and species diver- indices of those stations immediately vnstream from feedlots were significantly ver than the species diversity index at the con- l station. There was a significant increase in cies diversity indices during the 1970-71 seg- nt of the study, following the closing of two dlots. The results indicate periodic feedlot ru- ff had a continuing adverse effect on the en- onmental quality of the river, but recovery was id as the organic load on the river was reduced. ortland-Battelle)

INFLUENCE OF SULFITE ON GROWTH, SLIME, AND FLUORESECENT PIGMENT FOR- MATION BY PSEUDOMONAS AERUGINOSA,
Eastern Regional Research Lab., Philadelphia, Pa.
S. A. Palumbo.
Canadian Journal of Microbiology, Vol 19, No 4, p 505-511, April 1973. 2 fig, 4 tab, 21 ref.

Descriptors: *Cultures, *Pigments, *Growth rates, *Water pollution effects, *Sulfur compounds, Iron, Slime, Incubation, Hydrogen ion concentration, Temperature, Nutrients, Turbidity, Environmental effects.
Identifiers: *Pseudomonas aeruginosa, *Sulfites, *Bacterial physiology, Fluorescent pigments, Culture media, Pyocyanine, Bisulfites.

Substitution of sulfite for sulfate in the defined pyocyanine medium of Frank and DeMoss 1959 allowed formation of fluorescent pigments and slime by Pseudomonas aeruginosa NRRL B-4014. This formation of fluorescent pigments was both pH and iron dependent. The unadjusted medium (pH 8.25) containing sulfite and Fe (3 plus) allowed both growth and fluorescent pigment formation. Growth and fluorescent pigment formation were observed from a pH of 9.0 down to a pH of 7.5. At pH 7.5, the concentration of HSO3 (minus) is 0.0006 M, and this ion appears to be the active agent in inhibiting growth below pH 7.5. When the medium was adjusted to pH 7.0, neither fluorescent pigment formation nor growth was observed. The acid used for pH adjustment did not influence the minimum pH for growth. In the presence of small amounts of iron (ca. 1.0 microM Fe (3 plus)), the organism shifted from a blue to a yellow-green fluorescent pigment. Cultural conditions such as temperature and nutrients which supported growth also supported slime formation as well as fluorescent pigment formation. (Mortland-Battelle)

Identifiers: *Survival, *Vibrio parahaemolyticus, Chemical concentration, Culture media, Recovery.

Thermal resistance and minimal pH and temperature conditions for growth of Vibrio parahaemolyticus in artificial media containing 3 and 7 percent sodium chloride were studied. Growth was observed at pH 4.8 and at 5C. To study thermal resistance a 0.3-ml portion of a 24-h culture was dispensed into tubes containing 19.7 ml of Trypticase soy broth (TSB) with 3 percent NaCl which had been tempered at 53 plus or minus 0.2 C (128 F) in a water bath. Heating menstrua had been adjusted to pH values ranging from 5.0 to 8.0 in 0.5-unit increments. Samples were withdrawn, and dilutions were made immediately by using a 3 percent NaCl in water dilutent before plating in Trypticase-soy-agar (TSA) with 3 percent NaCl tempered at 45C. Recovery was at 37C, and counts were made after 24 h of incubation. Extensive growth at 5C was not observed at the pH values examined; no growth was observed at 2C. Growth at 5 and 9C was only at an alkaline pH. There was a tendency for growth at lower pH's as the incubation temperature was increased, regardless of NaCl concentration. With the exception of strain 4750, V. parahaemolyticus was demonstrated to grow at lower pH values in the TSB with 3 percent NaCl at pH 4.8 when incubation was at 30C, the lowest pH tolerance observed in the study. The six strains were least sensitive to heat at pH 7.0 and most sensitive at pH 5.0. (Mortland-Battelle)

SYNERGISTIC BIO-EFFECTS OF OIL AND IR- RADIATION IN AN AQUATIC ORGANISM, TARICHA GRANULOSA,
Environmental Protection Agency, Rockville, Md. Office of Research and Monitoring.
W. L. Lappenbusch, and J. M. Ward.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 2, p 75-79, February 1973. 2 fig, 6 ref.

Descriptors: *Oil, *Irradiation, *Water pollution effects, *Toxicity, *Radioactivity effects, Lethal limit, Animal pathology, X-rays, Bioassay, Laboratory tests, Mortality.
Identifiers: *Synergistic effects, *Rough-skinned newt, Histopathology, Necropsy, Animal tissues.

A study was conducted to determine lethal toxicity of oil and the possible synergistic effects of oil on the radiosensitivity of the rough-skinned newt (Taricha granulosa). After acclimitization at 10C to simulate winter conditions newts were initially placed in 4000 ml of water containing 0, 0.5, 1.0, 2.5, 5, 10, 20, or 50 percent by volume regular nondetergent motor oil. After determining oil toxicity levels, additional newts were classified in four groups prior to irradiation. One group was unexposed to either oil or irradiation, a second was irradiated only, a third was continuously exposed to 0.5 percent oil but not irradiated, and a forth continuously exposed to 0.5 percent oil and irradiated. The newts then absorbed 0, 1000, 2500, 5000, or 10,000 rads of x-rays. Their behavior, physical appearance and activity, and mortality were observed. Several dead newts of each group were necropsied and their tissues were examined. Oil toxicity was found to be acute, not chronic, at concentrations of 2.5 percent and higher. Newts subjected to 1,000, 2,500, 5,000, and 10,000 rads has mean survival times of 141, 117, 85 and 54 days. For those subjected to 0.5 percent oil and radiation these survival time were lowered to 98, 75, 53, and 29 days. It was concluded that exposure to oil increases the radiosensitivity of this newt synergistically. (Mortland-Battelle)

TOXICITY OF METHYL MERCURY FOR STEELHEAD TROUT SPERM,
Oregon Cooperative Fishery Unit, Corvallis.
J. D. McIntyre.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 2, p 98-99, February 1973. 1 tab, 2 ref.

Descriptors: *Toxicity, *Mercury, *Rainbow trout, Viability, Water pollution effects, Reproduction, Bioassay, Cold-water fish, Cytological studies.
Identifiers: *Sperm, *Methylmercury, *Steelhead trout, Salmo gairdneri, Methylmercuric chloride, Cell physiology.

Concentrations of methylmercuric chloride that would reduce the viability of sperm from the steelhead trout were determined. Sperm obtained from five fish was combined, and 0.1-ml aliquots were removed and inoculated into test tubes containing mercury concentrations of 1 g/l to 10 mg/l. The samples were maintained at 11C. The sperm was left in solution 30 minutes and then combined with 100 steelhead eggs from a single female. Percentage of fertilization was determined on the 17th day. Reduced fertilization of eggs indicated that concentrations of mercury greater than or equal to 1 ppm reduced sperm viability. At concentrations greater than 1 ppm the reductions increased sharply. (Mortland-Battelle)

CADMIUM TOXICITY AND ACCUMULATION IN SOUTHERN NAIAD,
Oklahoma Univ. Health Sciences Center, Oklahoma City. Dept. of Environmental Health.
J. E. Cearley, and R. L. Coleman.
Bulletin of Environmental Contamination and Toxicology , Vol 9, No 2, p 100-101, February 1973.

Descriptors: *Cadmium, *Toxicity, *Bioassay, Water pollution effects, Absorption, Food chains, Path of pollutants, Salts, Spectrophotometry, Chlorophyll, Turgidity, Plant physiology, Heavy metals, Aquatic plants.
Identifiers: *Southern naiad, *Bioaccumulation, *Najas guadalupensis, Stolons, Cadmium sulfate, Sample preparation, Ashing, Biological magnification, Mobilization, Macrophytes.

The effects of three different levels of cadmium on the uptake and accumulation of this metal by the southern naiad, a waterweed, were investigated. A static bioassay was conducted over a 21-day period using duplicate exposure chambers for each exposure level. The plants were acclimated for 2 weeks and the roots removed before placement in the containers. Plants were exposed to different Cd levels for 0, 11, and 21 days. After exposure, the plant tissues were rinsed, dried for 24 hrs at 100C, and ashed for 24 hours. Metal determinations were made by spectrophotometry. The exposed plants showed reductions of chlorophyll, turgor and stolon development not seen in controls. Toxic reactions and Cd accumulation by the plants increased as the exposure levels increased, which suggested that (a) Cd accumulation, ca. 1000 fold, was a direct function of the exposure level, and (b) the detoxifying mechanism was over-taxed at a more rapid rate at the higher levels resulting in an earlier impairment of physiological function. It is evident that this common aquatic plant is capable of introducing potentially toxic quantities of cadmium into the food chain of higher organisms, e.g. sunfish and waterfowl. (Mortland-Battelle)

FATTY ACID COMPOSITIONS OF PARACOLONS: ARIZONA, CITROBACTER, AND PROVIDENCIA,
Cornell Univ. Medical Coll., New York. Dept. of Microbiology.
N. A. Machtiger, and W. M. O'Leary.
Journal of Bacteriology, Vol 114, No 1, p 80-85, April 1973. 3 fig, 3 tab, 20 ref.

Descriptors: *Enteric bacteria, *Coliforms, Aerobic bacteria, Organic acids, Chemical analysis, Pollutant identification, Pathogenic bacteria
Identifiers: *Arizona arizonae, *Citrobacter freundii, *Providencia alcalifaciens, *Providencia stuartii, *Fatty acids, *Chemical composition, Flame ionization gas chromatography, Culture media, Sample preparation.

The fatty acid compositions of stationary-phase cultures of Arizona arizonae, Citrobacter freundii, Providencia alcalifaciens, Providencia stuartii, and Providencia sp. were studied. All organisms were grown in chemically defined media. Stationary-phase cells were harvested by centrifugation at 8200 times g for 20 min at 5 C, washed once in distilled water, and recentrifuged. The cell pastes were lyophilized, weighed and growth was measured turbidimetrically at 600 nm. Total cellular fatty acids were extracted from dry cells, methylated, and analyzed by dual-column, dual flame ionization gas chromatography. The major fatty acids of A. arizonae, C. freundii, and Providencia were 16:0, 16:1, 17:cyclopropane, and 19:cyclopropane. The fatty acid compositions of the two strains of A. arizonae examined were similar to each other, but the three strains of C. freundii differed from one another in their fatty acid compositions. In both A. arizonae and C. freundii, the relative quantities of saturated, unsaturated, and cyclopropane fatty acids were similar to those which have been found in stationary-phase cultures of other members of the Enterobacteriaceae. The three strains of Providencia also differed from one another in their fatty acid compositions. In all three strains the total quantity of unsaturated fatty acids was larger and that of the cyclopropane fatty acids was smaller than those found in stationary-phase cultures of other enteric bacteria. (Holoman-Battelle)

SURVIVAL OF SALMONELLA TYPHIMURIUM IN ANIMAL MANURE DISPOSAL IN A MODEL OXIDATION DITCH,
Minnesota Univ., St. Paul. Coll. of Veterinary Medicine.
L. A. Will, S. L. Diesch, and B. S. Pomeroy.
American Journal of Public Health, Vol 63, No 4, p 322-326, April 1973. 1 fig, 2 tab, 21 ref.

Descriptors: *Pollutant identification, *Farm wastes, *Oxidation lagoons, *Model studies, *Waste disposal, Public health, Biochemistry, Dissolved oxygen, Hydrogen ion concentration, Temperature, Cultures, Sampling, Pathogenic bacteria, Aerobic bacteria, Methodology.
Identifiers: Survival, *Salmonella typhimurium, Fluorescent antibody techniques, Biochemical tests, Feces, Sample preservation, Culture media, Serology, Fecal coliforms, Leptospira pomona, Enrichment.

A laboratory model oxidation ditch was constructed to evaluate potential health effects of pathogens in cattle manure. The studies were conducted in a 1:10 scale model with pH, DO, temperature, and total solids regulated to simulate a field unit at summer (20C) and winter (2C) temperatures. Liquid manure obtained from a field ditch was placed in the laboratory ditch. Stock cultures of biologically and serologically pure Salmonella typhimurium were grown on tryptic soy agar and seeded into the ditch. Various cultural methods were used in measuring survival and differentiation was accomplished both biochemically and serologically. At summer temperatures S. typhimurium survived for 17 days post-seeding and at winter conditions for 47 days. The data indicated that survival was of greatest duration in the sludge portion of settling chambers. Attempts were made during the tests to use fluorescent antibody methods for measurement but these were not as successful as anticipated. Retrieval of fluorescent organisms from the enrichment phase media was more successful than sampling directly from the oxidation ditch manure. (Mortland Battelle)

METHANOL METABOLISM IN PSEUDOMONAD C,
Hadassah Medical School, Jerusalem (Israel)
B. Stieglitz, and R. I. Mateles
Journal of Bacteriology, Vol 114, No 1, p 390-398, April 1973. 8 fig, 5 tab, 19 ref

Descriptors: *Metabolism, *Pseudomonas, *Radioactivity techniques, Nutrient requirements, Assay, Enzymes, Carbon radioisotopes, Aerobic bacteria, Oxidation, Electron microscopy, Colorimetry, Spectrophotometry, Bicarbonates, Absorption
Identifiers: *Methanol, *Substrate utilization, *Fate of pollutants, Bacterial physiology, Pseudomonads, Methanol dehydrogenase, Enzymatic activity, C-14, Assimilation, Hexose phosphate synthetase, Sample preparation, Paper chromatography, Culture media, Formaldehyde, Formates, Ethanol, Methylamine, Succinates, Citrates, Lactates, Serine, Glyoxylates, Pyruvates, Propanol, Butanol, Formate dehydrogenase, Formaldehyde dehydrogenase, Glycerate dehydrogenase

Cell suspensions of pseudomonad C, a bacterium capable of growth on methanol as sole carbon source, were able to oxidize methanol, formaldehyde, and formate, although the rates of oxidation for the latter two compounds were much slower. The latter compounds also could not serve as sole carbon sources. Through the use of labeled compounds, it was shown that in the presence of methanol, formaldehyde, formate, and bicarbonate were incorporated into trichloroacetic acid-precipitable material. Hexose phosphate synthetase activity was found, indicating the assimilation of methanol via an allulose pathway. No hydroxypyruvate reductase activity was found, nor was any complex membrane structure observed. Such a combination of characteristics has been observed in an obligate methylotroph (Psuedomonas W1), but pseudomonad C can utilize a variety of non-methyl substrates. (Holoman-Battelle)

METABOLISM OF ENDOTHALL BY AQUATIC MICROORGANISMS,
Syracuse Univ. Research Corp., N.Y. Life Sciences Div.
H. C. Sikka, and J. Saxena.
Journal of Agricultural and Food Chemistry, Vol 21, No 3, p 402-406, May/June 1973. 5 fig, 3 tab, 16 ref.

Descriptors: *Aquatic microorganisms, *Metabolism, *Microbial degradation, *Aquatic environment, *Cultures, Lakes, Hydrosols (Soils), Aquatic bacteria, Bottom sediments, Herbicides, Radioactivity techniques, Amino acids, Proteins, Lipids, Inhibition, Path of pollutants, Chromatography.
Identifiers: *Fate of pollutants, *Endothall, *Arthrobacter, *Substrate utilization, Biological magnification, Assimilation, Degradation products, 7-Oxabicyclo (2.2.1)heptane-2 3-dicarboxylic acid, Mobilization, Nucleic acids, Citric acid, Glutamic acid, Aspartic acid, Alanine, Monofluoroacetate, Sample preparation.

(C-14)Endothall (7-oxabicyclo (2.2.1)heptane-2,3-dicarboxylic acid) labeled in the oxabicyclo ring was readily degraded by microorganisms in lake water and hydrosoil through a pathway involving splitting of the ring. An Arthrobacter species isolated from hydrosoil by the enrichment method was able to utilize endothall as the sole source of carbon and energy for its growth. The C-14 from endothall was incorporated into cellular amino

acids, proteins, nucleic acids, and lipids and was also released as C-1402. After short-term incubation of the Arthrobacter with (C-14)endothall, C-14 was incorporated into citric, aspartic, and glutamic acids and some unidentified compounds. (C-14)Glutamic acid accounted for a large proportion of the total C-14 incorporated into the alcohol-soluble cell fraction. Treatment with 0.02 M monofluoroacetate caused a severalfold accumulation of (C-14) citric acid, but only partially inhibited the incorporation of C-14 into glutamic acid. It appears, therefore, that the C-14 from C-14-ring-labeled endothall is incorporated into glutamic acid via the tricarboxylic acid cycle and an alternate, unknown pathway. (Holoman-Battelle)

UPTAKE AND ACCUMULATION OF DDT AND PCB BY EPHEMERA DANICA (EPHEMEROPTERA) IN CONTINUOUS-FLOW SYSTEMS,
Lund Univ. (Sweden). Dept. of Zoology.
A. Sodergren, and Bj. Svensson.
Bulletin of Environmental Contamination and Toxicology, Vol 9, No 6, p 345-350, June 1973. 1 fig, 2 tab, 13 ref.

Descriptors: *DDT, *Polychlorinated biphenyls, Absorption, *Mayflies, *Pesticide kinetics, Laboratory tests, Pesticide residues, Mathematical models, Gas chromatography, Chlorinated hydrocarbon pesticides, Aquatic insects, Immature growth stage, Bioassay, Water pollution effects.
Identifiers: *Ephemera danica, *Bioaccumulation, Continuous flow system, Nymphs, p p'DDT, Metabolites, p p'DDE, p p'DDD.

The kinetics of uptake and accumulation of DDT and PCB by mayflies was examined in a continuous-flow systems. Fifty Ephemera danica nymphs were used as test organisms and were introduced to the continuous-flow system immediately after collection from a Swedish stream. DDT and PCB were dissolved in ethanol and added to the systems. Five nymphs were then withdrawn each day for residue analysis. During the nine days of the experiment the animals received no food so that uptake was strictly via the gills and integument. Gas chromatography was used for residue analysis. Uptake and accumulation of both substances followed a similar pattern. After 4-5 days exposure an apparent constant level was established, indicating equilibrium between uptake and excretion of the substances. The accumulation of residues as a function of the concentration in the water showed a similar pattern. A kinetic equation of the first order is proposed as a model for uptake. (Mortland-Battelle)

A METHOD FOR RTING CHEMICALS FOR POTENCY AGAINST FISH AND OTHER ORGANISMS,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
L. L. Marking.
US Bur Sport Fish Wildl Invest Fish Control. 36-38. 3-8. 1970. Illus.
Identifiers: Chemicals, *Fish, Methods, Organisms, *Toxicity ratings, Lethal limit, Water pollution effects.

A potency rating system by which the toxicity of chemicals to organisms can be assessed with a minimum of data from preliminary bioassays was presented. This method permitted effective and rapid evaluation of toxicity when data from preliminary tests were inadequate for statistical analysis. In bioassays of chemicals against fish, the mortality was recorded in 3-96-hr tests when exposed to 3 concentrations. The potency rating of a bioassayed chemical, when compared with the maximum value on the rating scale, indicated the relative toxicity of the chemical. Concentrations and exposure times could be changed to fit a specific bioassay program. Results of 24-or 48-hr bioassays could be compared with 96-hr bioassays because the maximum values of the rating scales were approximately equal at all time intervals. The potency rating was more applicable to toxicants with similar dose-effect curves.--Copyright 1973, Biological Abstract, Inc.

PERSISTENCE OF VIRUS AND BACTERIA IN SEAWATER,
California Univ., Berkeley. School of Public Health.
W. D. Won, and H. Ross.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE3, p 205-211, June 1973. 6 fig, 1 tab, 9 ref.

Descriptors: *Sea water, *Persistence, *E. coli, *Environmental effects, *Enteric bacteria, *Viruses, Coliforms, Water temperature, Water pollution, Domestic wastes, Public health, Organic wastes, Organic compounds.
Identifiers: Survival, Echo 6 virus, Culture media, Enrichment, Enterovirus, Cell morphology, Fecal pollution, Feces, Yeast extract, Trypticase soy broth, Casamino acid, Peptone, Heart infusion broth, Casitone.

At a temperature of 38 F-40 F bacterial survivals (Escherichia coli) were significantly enhanced in seawater deliberately 'polluted' with small concentrations of organic materials (25 ppm-500 ppm) including peptone, heart infusion, casamino acid, yeast extract, trypticase soy, and human feces. In a warmer environmental temperature the survival enhancing property of these substances became growth promoting resulting in a 40-fold population increase followed with a marked increase in microbial persistence lasting at least 18 weeks. These substances were also capable of stabilizing cell and colony morphology. The same phenomenon was not observed in parallel experiments with Echo 6 virus. In this instance, cold temperature per se appeared more effective in enhancing survival time. Inactivation rate was gradual and the virus persisted for 14 weeks at 38 F-40 F, contrasted sharply with an 8-day persistence at an environmental temperature of 72 F. (Holoman-Battelle)

MERCURY CONTAMINATION OF FISH IN NORTHWESTERN ONTARIO,
Acres (H. G.) and Co. Ltd., Niagara Falls (Ontario).
N. Fimreite, and L. M. Reynolds.
Journal of Wildlife Management, Vol 37, No 1, p 62-68, January 1973. 2 fig, 4 tab, 17 ref.

Descriptors: *Mercury, *Freshwater fish, Water pollution effects, *Industrial wastes, Water pollution sources, Rock bass, Walleye, Lake trout, Water pollution, Path of pollutants, Lakes, Rivers, Absorption, *Canada.
Identifiers: *Chlorine plants, *Atomic absorption spectrophotometry, Northern pike, White sucker, Burbot, Biological samples, Sample preparation, Acid digestion, Clay Lake, Wabigoon River, Ball Lake, Tide Lake, Indian Lake, Grassey Narrows Lake, Tetu Lake, Big Canyon Lake, Long Legged Lake, Sumach Lake, Oak Lake, Maynard Lake, Scotty Lake, Dumpy Lake, Lennan Lake, Rowdy Lake, Sydney Lake, Roger Lake.

Fish to be analyzed for mercury were gill-netted from 18 lakes and rivers in Northern Ontario, some of which were upstream and downstream from a chlorine plant which had leaked about 3,000 lbs of mercury annually from 1962-1970. Samples consisted of 186 specimens of walleye, northern pike, lake trout, burbot, rock bass, and white sucker. Mercury content was determined in lateral musculature by wet digestion of the samples followed by cold vapor atomic absorption spectrophotometry. The maximum mercury levels in northern pike, burbot, and walleye were 27.8, 24.8, and 19.6 ppm respectively, measured in specimens taken 50-60 miles downstream from the plant. They decreased proportionally to the distance from the plant but were clearly elevated even 200 miles downstream. The levels in specimens from suspected uncontaminated lakes were generally below 1 ppm but frequently above the 0.2 ppm often considered as the maximum background concentrations. The latter finding may possibly be explained on the basis of the oligotrophic conditions characteristic for these lakes. (Little-Battelle)
W73-13287

COMPARATIVE TOXICITY OF 29 NITROSALICYLANILIDES AND RELATED COMPOUNDS TO EIGHT SPECIES OF FISH,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
L. L. Marking, and W. A. Willford.
US Bur Sport Fish Wildl Invest Fish Control. 36-38. 3-11. 1970.
Identifiers: Black bullheads, Bluegill, Carp, Fathead minnows, *Fish, Goldfish, Green sunfish, Minnow, *Nitro salicylanilides, Rainbow trout, Organic compounds, Species, *Toxicity, Yellow perch.

The relative potencies of 29 nitrosalicylanilides and related structures against rainbow trout, goldfish, carp, fathead minnows, black bullheads, green bullheads, green sunfish, bluegills and yellow perch were determined in 96-hr static bioassays and varied from zero to the maximum potency of the system, depending on the type and position of substitutions. The 4'-substitutions on 3-nitrosalicylanilide were essential in producing high toxicity and selectivity to fish. The toxic activity of nitrosalicylanilides increased as halogen substitutions were shifted from the 2' to the 3' and to the 4' positions on the aniline moiety. Activity increased as molecular weight of the substituent increased. 4'-Azophenyl-3-nitrosalicylanilide and 4'-iodo-3-nitrosalicylanilide were more toxic than 4'-bromo- or 4'-chloro-3-nitrosalicylanilide. The dihalo-substituted 3-nitrosalicylanilides were more toxic than monohalo-substituted 3-nitrosalicylanilides provided one of the halosubstitutions was at the 4'-position on the aniline moiety. 4'-Bromo-3-nitrosalicylanilide was more toxic to carp, fathead minnows, bluegills and yellow perch than to rainbow trout. Several compounds were selective to yellow perch. Goldfish were the most resistant species to the salicylanilides.--Copyright 1973, Biological Abstracts, Inc.

ECOLOGICAL EFFECTS OF OFFSHORE DREDGING AND BEACH NOURISHMENT: A REVIEW,
University of Southern Mississippi, Hattiesburg.
J. R. Thompson.

Available from the National Technical Information Service as AD-756 366, $3.00 in paper copy, $1.45 microfiche. Miscellaneous Paper No 1-73, January 1973. 39 p, 196 ref.

Descriptors: *Dredging, *Sediments, Ecosystems, *Environmental effects, *Coastal engineering, Bibliographies, Reviews, Benthic flora, Bottom fish, Biota, Turbidity, Suspended solids, Benthic fauna, Zoning, Abstracts, Documentation, Bottom sediments, Data collections, Marine bacteria, Physical properties, Chemical properties, Ecology, Coasts, Marine algae, Marine fish.
Identifiers: *Beach nourishment, Marine environment.

A review of ecological effects of offshore dredging is presented, based on literature review and personal contacts, to provide a framework for determination of need for further knowledge. In general, little concrete effort aimed specifically at the determination of effects of offshore dredging was uncovered, although basic ecological works that are generally applicable are available. Much additional research of basic, but practical, orientation is needed to approach full understanding. The beach may be divided into three zones on the basis of moisture and biota found. The possible effects on these biota resulting from offshore dredging and deposition of sediments on a beach are described. Background descriptive material and impacts on both offshore dredged areas and nourished beaches, and suggestions for further research follow. (Mortland-Battelle)
W73-13290

EFFECT OF THERMAL SHOCK ON VULNERABILITY TO PREDATION IN JUVENILE SALMONIDS. II. A DOSE RESPONSE BY RAINBOW TROUT TO THREE SHOCK TEMPERATURES,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
C. C. Coutant.
Available from the National Technical Information Service as BNWL-1519, $3.00 in paper copy, $1.45 microfiche. Report No UC-48, November 1972. 12 p, 2 fig, 1 tab, 7 ref. Contract No AEC AT (45-1)-1830.

Descriptors: *Thermal pollution, *Predation, *Thermal stress, *Chinook salmon, *Rainbow trout, *Laboratory tests, Water temperature, Lethal limit, Juvenile fish, Bioassay, Water pollution effects, Time, Heat resistance.
Identifiers: *Thermal shock, Salmo gairdneri, Oncorhynchus tshawytshcha.

Juvenile rainbow trout (Salmo gairdneri) were found to be more vulnerable to predation following thermal shock, dependent on the thermal dose (temperature and duration) received. The fish were exposed to temperatures of 26, 28, and 30C for periods from 0.5 to 100 minutes. Control fish were exposed to unheated water. Control and shocked fish were then reunited at the acclimation temperature and offered to adult rainbow trout predators. The predators were allowed a maximum of 15 minutes to remove about 50 percent of the prey and the remaining test and control fish were counted. A chi-square analysis was used on the results. At 30C exposure, an identifiable effect in vulnerability of the shocked fish occurred after only 0.55 min exposure. At 28C, an exposure of about 2 min was needed to increase vulnerability. The 26C exposure temperature, included significantly different predation rates after 64 min but not after 16 or 32 min. (Mortland-Battelle)

TOXICITY OF 33NCS (3'-CHLORO-3-NITROSALICYLANILIDE) TO FRESHWATER FISH AND SEA LAMPREY,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
L. L. Marking, E. L. King, C. R. Walker, and J. H. Howell.
US Bur Sport Fish Wildl Invest Fish Control 36: 38. 3-16. 1970.
Identifiers: Bowfin, Carp, Catfish, Channel, Chlor 3-Nitro, Fish, *Fresh water fish, *Salicylanilides, *Sea lamprey, Sunfish, *Toxicity, Trout, Water pollution effects.

The chemical 33NCS (3'-chloro-3-nitrosalicylanilide) was evaluated as a fish control agent and as a larvicide for sea lampreys. The chemical was rapidly toxic to many species. Sea lampreys, bowfin and channel catfish were the most sensitive species. Carp were more sensitive than trouts or sunfishes. Use of 33NCS in selective control of freshwater fishes or sea lampreys required precise control because its toxicity was strongly influenced by variations in water quality.--Copyright 1973, Biological Abstracts, Inc.

ACCUMULATION AND RETENTION OF 85SR MARKS BY YOUNG LARGEMOUTH BASS,
Cornell Univ., Ithaca, N.Y. Dept. of Natural Resources.
M. H. Shealy, Jr., and C. A. Carlson.
1971. 42 P. OWRR A-013-NY (7). 14-01-0001-927, 1400, 1852, 14-31-0001-3032.

Descriptors: *Bass, *Marking techniques, Radioecology, *Mortality, *Radioactivity effects, Growth stages, Strontium radioisotopes.
Identifiers: *Fish embryos.

First-year mortality in largemouth bass, Micropterus salmoides (Lacepede), is often higher than 90%. To better understand the role of predation by aquatic invertebrates in this high death rate, young bass were marked at four different ages with 85Sr for subsequent use in predation studies. Resulting radiostrontium accumulation and retention curves indicate that this radionuclide is suitable for quantitative marking of prolarval, postlarval, and juvenile bass, but not embryos. Bass embryos were exposed to one, and prolarval and older stages to three, 85Sr concentrations at 20 to 23C. Exposure energies ranged from 0.0 (controls) to 89.1 microCi/liter pond water. Twelve-hr radioaccumulation and retention rates were obtained for embryos (2 days old). Radioaccumulations were monitored in prolarvae (<1 day old) at 12-hr intervals from 12 to 168 hr, in postlarvae (15 days old) at 24-hr intervals from 24 to 144 hr, and in juveniles (40 days old) at 24-hr intervals from 24 to 120 hr. Bass from all accumulation experiments were transferred, after various periods of exposure, to pond water to which no 85Sr was added, and mark retentions were evaluated for periods of up to 106 days.

THE ANOPHELES GAMBIAE COMPLEX AND MALARIA TRANSMISSION AROUND KISUMU, KENYA,
East African Inst. of Malaria and Vector-borne Diseases, Amani (Tanzania)
G. B. White
Identifiers: *Anopheles-Gambiae, Fenitrothion, Insecticides, *Kenya (Kisumu), *Malaria transmission

The environment surrounding Kisumu in Kenya, East Africa, is described, emphasizing the importance of the Nyando valley as a highly malarious area compared with the Nandi and Kisii hills where only epidemic malaria occurs. Available data on malaria transmission are summarized. The varying seasonal importance of A. gambiae as a vector in the different topographical areas is discussed. Data resulting from a brief survey of the A. gambiae complex (Nov. 10-Dec 3, 1970) conducted during very hot and dry weather are presented to show that Species A and Species B resting in houses are differentially distributed in this part of Nyanza. Species B predominated in the lowlands and was prolific in the artificially irrigated areas. Species A predominated in the highlands. Both sibling species were well represented in sympatric association among foothills. Only 3 females of A. gambiae (1A and 2B) were obtained from the experimental area of 23 square miles employed by the World Health Organization (WHO) for hut testing of fenitrothion for anopheline control. Circumstances indicated that both Species A and Species B formerly occurred more abundantly in this zone. Although Species A was restricted virtually to the highlands and foothills at this season, populations of A. probably would encroach into the lowlands during raining periods. WHO data on parous rates of A. gambiae at 2 localities near Kisumu are presented to show that Species B may continue reproducing at a greater rate than Species A as the dry season progresses.--Copyright 1973, Biological Abstracts, Inc.

NITROGEN-FIXING BLUE-GREEN ALGAE OF SOILS, RICE FIELDS AND EPHEMERAL BASINS OF THE SOUTHERN UKRAINE, (IN RUSSIAN),
L. P. Prykhod'kova.
Ukr Bot Zh. Vol 28, No 6, p 753-758. 1971. English summary.
Identifiers: *Algae (Nitrogen-fixing), Anabaena-variabilis, Cylindrospermum-Michailovskoense, Nitrogen, Nostoc-Commune, Nostoc-Linckia, Rice fields, *Soils, *Ukraine (USSR), *Cyanophyta.

Of the 23 spp. found, 12 spp. were from soils (southern chernozems, dark-brown, chestnut, solonetz, gley-solods, solonchaks, meadow, bog and sands), 16 from the ephemeral basins and 18 from the rice fields. Many species were seen rarely in small amounts. Nostoc commune (Vauch.) in sensu Elenk., N. linckia (Roth.) Born. et Flah. in sensu Elenk., Cylindrospermum michailovskoense Elenk., Anabaena variabilis Kuetz. and others were sometimes dominant in the soils and basins. The blue-green algae developed more abundantly in the rice fields. The amount of N-fixing species at the beginning of rice vegetation is negligible and increases in Aug. and Sept. In the subsaline basins blue-green algae N-fixers were more frequent and more diverse.--Copyright 1973, Biological Abstracts, Inc.

W73-13391

EXPERIMENTAL STUDY OF THE EFFECT OF TEMPERATURE ON SOME PIKE PARASITES, (IN RUSSIAN),
Leningrad State Univ. (USSR).
B. I. Kuperman, and R. E. Shul'man.
Vestn Leningr Univ. Ser Bio. Vol 27, No 1, p 5-15. 1972. English summary.
Identifiers: Ergasilus-Sieboldi, *Parasites, *Pike, *Temperature effects, Triaenophorus-Crassus, Triaenophorus-Nodulosus.

The effect of temperature on the lifecycle of Triaenophorus nodulosus, T. crassus and Ergasilus sieboldi was investigated. The change of temperatures from winter and autumn to spring and summer had different effects on the parasites. The temperature affects the parasites indirectly, as it changes the physiological state of the host, and this in turn affects the parasites.--Copyright 1973, Biological Abstracts, Inc.

USE OF HANFORD WASTE PONDS BY WATERFOWL AND OTHER BIRDS,
Battelle-Pacific Northwest Labs., Richland, Wash.
R. E. Fitzner, and K. R. Price.
Available from NTIS, Springfield, Va., as BNWL-1738; $4.00 in paper copy, $1.45 in microfiche. Report BNWL-1738, February 1973. 47 p, 7 fig, 4 tab, 19 ref.

Descriptors: *Washington, *Waterfowl, *Absorption, *Nuclear wastes, Census, Mallard duck, Ringnecked duck, Migratory birds, Game birds, Radioisotopes, Absorption, Food webs, Public health, Food chains, Radioactivity effects, Path of pollutants, Aquatic habitats, Ponds, Cooling water.

Irrigation and hydroelectric development in the Columbia Basin have increased waterfowl. Four waste ponds in an area of the Hanford Reservation are being observed that range from 17-71 acres in acrea, 2-10 feet in depth, and have radioactivity less than 50 picoCuries/ml. Sampling has shown that there is insufficient radioactivity in the birds to be hazardous to human consumption. A census of birds over a year (16 species of waterfowl and 90 species of other birds) indicated that remote, large-area, and deep ponds were most attractive. Eighty-five percent of the species were migrants; Mallard ducks and Ring-necked ducks were the most abundant species and were present for long times. It is planned to study radionuclide uptake by a colony of young birds in the spring, and of populations simulating wintering waterfowl. Information about the general life history of the species observed is reviewed. (Bopp-ORNL)

AMCHITKA BIOENVIRONMENTAL PROGRAM. RESEARCH PROGRAM ON MARINE ECOLOGY, AMCHITKA ISLAND, ALASKA, JULY 1, 1971-JUNE 30, 1972,
Washington Univ., Seattle.
R. E. Nakatani, J. S. Isakson, and R. L. Burgner.
Available from NTIS, Springfield, Va., as BMI-171-150; $5.45 in paper copy, $1.45 in microfiche. Report BMI-171-150, April 1973. 73 p, 11 fig, 9 tab, 22 ref, 3 append.

Descriptors: *Marine algae, *Marine fisheries, *Nuclear explosions, *Alaska, Marine animals, Intertidal areas, Aquatic habitats, Autogenic succession, Sampling, Monitoring, Invertebrates, Fish populations, Fishkill, Environmental effects.

Effects on marine fish, invertebrates, and algae were studied including radiological sampling. The Cannikin nuclear test caused permanent uplift of intertidal benches about 6.1 km alongshore, disrupting algae and invertebrates; but recovery of fish populations is expected since only a small habitat area was disrupted. In the smaller area of disruption from the Milrow test, Hedophyllum alga replaced Fucus, leading to growth comparable to that on nearby undisturbed rocks; compared with 1971 observations, an area of siltation on the intertidal bench was reduced in size. (Bopp-ORNL)

FRESHWATER VERTEBRATE AND INVERTEBRATE ECOLOGY OF AMCHITKA ISLAND. JULY 1, 1971-JUNE 30, 1972,
Utah State Univ., Logan.
W. T. Helm, and R. A. Valdez.
Available from NTIS, Springfield, Va., as BMI-171-148; $4.00 in paper copy, $1.45 in microfiche. Report BMI-171-148, April 1973. 17 p, 3 fig, 4 tab, 4 ref.

Descriptors: *Water pollution effects, *Alaska, *Nuclear explosions, *Aquatic habitats, Fishkill, Fish populations, Environmental effects, Lakes, Streams, Silting, Oil pollution, Smolt, Salmon.

The Cannikin test drained 5 freshwater lakes (by fissures and tilting) that are not expected to refill and support fish. Drilling mud spillage from a retention pond severely depleted aquatic life in one small stream. Another stream similarly polluted during the Milrow test showed recovery from pollution. Pollution of streams (about 5% of the total) and lakes (about 0.2%) by drainage of oil and silt may have longer-lasting effects. Smolting of coho salmon was studied. (Bopp-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO OPERATION OF SURRY POWER STATION UNIT 1.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50280-75. $7.60 per copy, $1.45 microfiche. Docket 50280-75, May 1972. 286 p, 39 fig, 32 tab, 175 ref, 10 append.

Descriptors: *Nuclear powerplants, *Effluents, Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Virginia.
Identifiers: *Pressurized water reactors, James River, *Environmental impact statements.

This final environmental statement relates to the proposed issuance of an operating license for the Surry Power Station Unit 1. The plant is located in Surry County, Virginia, and will employ two pressurized water reactors which will be covered by water from and returned to the James River. Environmental impacts are assessed, and, after consideration of alternatives, an environmental benefit-cost summary was compiled. Some environmental factors considered include hydrology (surface water and groundwater), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion was to issue an operating license for Unit 1 subject to the following conditions: (1) establish a monitoring program, both radiological and nonradiological to determine the impact of the plant on the environment, (2) monitor the number and species of fish kills attributed to operation of the station. (Houser-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE ST. LUCIE PLANT UNIT NO. 1.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50335-63; $7.60 per copy, $1.45 microfiche. Docket 50335-63, June 1973. 284 p, 21 fig, 31 tab, 115 ref, 2 append.

Descriptors: *Nuclear powerplants, *Effluents, Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Florida, Atlantic Ocean, Iodine.
Identifiers: *Pressurized water reactors, Indian River, Big Mud Creek, *Environmental impact statements.

This final environmental statement relates to the proposed continuation of construction and issuance of an operating license for the St. Lucie Plant Unit No. 1. The plant is located on Hutchinson Island on the East Coast of Florida, midway between the cities of Fort Pierce and Stewart. It will use a pressurized-water reactor cooled by a once-through system with water from and discharged to the Atlantic Ocean. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to continue the construction permit and issue an operating license subject to the following conditions: (1) Minimize beach construction activities during turtle nesting season. (2) Restore disturbed dune area. (3) Maintain I-131 release as low as practicable. (4) Plant pines for light screens. (5) Perform an aquatic monitoring program. (6) Determine the effect of the thermal plume on turtle nesting. (7) Conduct a radiological monitoring program. (8) Ensure that the thyroid dose though food

chain (grass-cow-milk) does not exceed 5 mrem/yr. (9) Monitor residual chlorine concentration. (10) Define a comprehensive environmental monitoring program and include in specifications. (11) Provide an analysis and plan of action against any detrimental effects found. (Houser-ORNL)
W73-13410

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE CONTINUATION OF CONSTRUCTION OF UNIT 2 AND THE OPERATION OF UNITS 1 AND 2 MILLSTONE NUCLEAR POWER STATION.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket No. 50336-65, $7.60 per copy, $1.45 microfiche. Report No. Docket 50336-65, June 1973. 315 p, 24 fig, 47 tab, 138 ref, 2 append.

Descriptors: *Nuclear powerplants, Effluents, Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Water cooling, Connecticut, *New York.
Identifiers: *Boiling water reactor, *Pressurized water reactors, Niantic Bay, Long Island Sound, *Environmental impact statements.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed continuation of construction permit for Unit 2 and operation licenses for Units 1 and 2 Millstone Nuclear Power Station. This station is located in the town of Waterford, Connecticut. Cooling is by a once-through flow of water from Niantic Bay which is discharged through a quarry pond and back into Long Island Sound. Unit No. 1 is a boiling water reactor and Unit No. 2 a pressurized water reactor. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to continue the construction permit for Unit 2 and issue operating licenses for Units 1 and 2 subject to the following conditions: (1) applicant shall define acceptable comprehensive environmental sampling monitoring, and surveillance programs as a part of technical specifications for Units 1 and 2; (2) a further study of the discharge of water from the quarry to Long Island Sound to minimize entry of aquatic organism into the quarry; (3) continue study to lessen impingement of aquatic bodies on the cooling water intake screens; (4) provide analysis and propose a course of action to alleviate problems found by the monitoring programs. (Houser-ORNL)
W73-13411

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE CONSTRUCTION OF SUSQUEHANNA STEAM ELECTRIC STATION UNITS 1 AND 2.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket 50387-40; $7.60 per copy, $1.45 microfiche. Report No. Docket 50387-40, June 1973. 323 p, 41 fig, 48 tab, 181 ref, 6 append.

Descriptors: *Susquehanna River, *Nuclear powerplants, Effluents, Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Pennsylvania.
Identifiers: *Boiling water reactors, *Environmental impact statements.

This final environmental statement relates to the proposed construction of the Susquehanna Steam Electric Station. This station is located on the Susquehanna River near Berwick in Luzerne County, Pennsylvania, and will employ two boiling water reactors. The exhaust steam will be cooled by water in a closed cycle circulated through two hyperbolic natural-draft cooling towers. All water used in the operation will be drawn from and ultimately discharged to the Susquehanna River. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It is concluded to issue a construction permit for the facility subject to the following conditions: (1) Re-seed transmission rights-of-way. (2) Control iodine releases to not exceed 5 mrem annual thyroid dose to a child via the air-cow-milk pathway. (3) Submit a list of chemicals for cleaning purposes and a method of waste disposal for approval. (4) Implement an environment monitoring program to determine ecological effects. (5) Conduct a preoperational radiological monitoring program to establish a baseline. (6) Provide an analysis and plan of action to eliminate harmful effects found. (Houser-ORNL)
W73-13412

FINAL ENVIRONMENTAL STATEMENT RELATED TO CONSTRUCTION OF NINE MILE POINT NUCLEAR STATION UNIT 2.
Directorate of Licensing (AEC), Washington, D.C.

Available from NTIS, Springfield, Va., as Docket No 50410-35; $13.60 per copy, $1.45 microfiche. Report No. Docket 50410-35, June 1973. 566 p, 27 fig, 43 tab, 136 ref, 13 append.

Descriptors: *Nuclear powerplants, *Effluents, Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *New York, Lake Ontario.
Identifiers: *Boiling water reactors, *Environmental impact statments.

This final environmental statement was prepared in compliance with the National Environmental Policy Act and relates to the proposed construction of the Nine Mile Point Nuclear Station Unit 2. The station is located in Scriba, New York, and will employ a boiling water reactor cooled by once-through water drawn from and discharged to Lake Ontario. The discharge will be combined with Unit No. 1 discharge. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was complied. Environmental factors include hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. The conclusion is to issue a construction permit subject to the following conditions: (1) Provide a biological sampling program for ecological data. (2) conduct a monitoring and sampling program at intakes to determine fish kill. (3) conduct a preoperational radiological monitoring program for base line evaluations. (4) implement a surveillance program to determine unanticipated effects. (Houser-ORNL)

LABORATORY OBSERVATIONS ON THE EARLY GROWTH OF THE ABALONE, HALIOTIS SORENSENI, AND THE EFFECT OF TEMPERATURE ON LARVAL DEVELOOMENT AND SETTLING SUCCESS,
Scripps Institution of Oceanography, La Jolla, Calif.
D. L. Leighton.
Fishery Bulletin, Vol 70, No 2, p 373-381, 1972. 6 fig, 1 tab, 16 ref.

Descriptors: *Growth rates, *Temperature, *Shellfish, *Larvae, Biology, Aquatic animals, Aquatic environment, Metabolism, Mortality, Nutrients, Growth stages, Environmental effects, Laboratory tests.
Identifiers: *Abalone.

The influence of temperature on larval development rate and growth of juveniles of the white or Sorensen's abalone, Haliotis sorenseni, was investigated using a thermal gradient apparatus. While larvae developed most rapidly at 20C, most settled juveniles at that temperature did not survive. At 15 to 16 C, however, the operculate veliger stage was attained in 72 hours and settlement of advanced individuals occurred in 9 days. No settling was observed at 10 C. Juveniles maintained at 15 to 19 C and provided mixed diatoms as food showed marked variability in growth rate; at 130 days shell length ranged from 4.0 to 8.0 mm (average 5.5 mm). Two distinctly different patterns of shell pigment distribution emerged with continued growth. Approximately 60% of the juveniles were bicolored, red and yellow-green, while the remainder had an even tone of red-violet. (Jerome-Vanderbilt)

CHANGE IN FEEDING AND BODY CONDITION OF BROWN BULLHEADS OVERWINTERING IN THE HEATED EFFLUENT OF A POWER PLANT,
Essex Marine Lab.,Conn.
R. R. Massengill.
Chesapeake Science, Vol 14, No 2, p 138-141, 1973. 1 fig, 1 tab, 10 ref.

Descriptors: *Winter, *Growth rates, *Food habits, *Bullheads, *Heated water, Thermal pollution, Environmental effects, Fish, Fish behavior,

asonal, Feeding rates, Aquatic environment, -site data collections, Evaluation, Electric werplants.

nter food habits and condition factors of the wn bullhead, Ictalurus nebulosus, were deter- ned from specimens collected in the discharge al of the Connecticut Yankee Atomic Com- y plant and Chapman Pond, a cove of the Con- ticut River unaffected by artificial heating. mach content analysis indicated that fish over- tering in the heated discharge fed, while those vater at 2 C from Chapman Pond did not. Fish, elids, insects, molluscs and zooplankton were sumed, with fish as the most abundant food. llheads began feeding before the temperature ched 4 C in Chapman Pond. The normal bull- d diet of invertebrates shifted to smaller fish in densely populated canal. Although bullheads in canal fed throughout the winter, their body dition was poorer than that of fish overwinter- in Chapman Pond. (Jerome-Vanderbilt)

LOW-TEMPERATURE ACCLIMATION AND THE SEASONAL TEMPERATURE SENSITIVITY OF SOME TROPICAL MARINE FISH,
Smithsonian Tropical Research Inst., Balboa, Canal Zone.
J. B. Graham.
Physiological Zoology, Vol 45, No 1, p. 1-13, January 1972. 7 fig, 6 tab, 17 ref.

Descriptors: *Seasonal, *Cold resistance, *Heat resistance, *Tropical regions, *Marine fish, Biology, Animal physiology, Adaptation, Temperature, Aquatic environment, Metabolism, Respiration, Mortality, Oxygen demand.

Seasonal changes in upper and lower lethal temperatures have been measured in four ecologically different species of tropical marine fish. Also two species were monitored for seasonal changes in their oxygen consumption rates and the oxygen consumption rates of three species were measured after they had been acclimated to 17C for at least 6 weeks. None of the species studied makes seasonal temperature compensations such as those commonly found in temperate-zone fishes. All fish studied were capable of acclimating to 17C, but the extent of the capacity and resistance adaptations varies for each species and is related to differences in littoral distribution. A positive correlation between upper lethal temperature and habitat temperature of Abudefduf troschelii from different locations, the wide range of thermal tolerances found for the species studied and their capacity for cold acclimation attest to the eurythermality of tropical marine species. (Jerome-Vanderbilt)

INFLUENCE OF PHENOL AND TEMPERATURE ON THE RESPIRATION OF A FRESHWATER SNAIL HELISOMA TRIVOLVIS,
Rutgers-The State Univ., New Brunswick, N.J. Dept. of Zoology.
M. J. Sheanon, and F. B. Trama.
Hydrobiologia, Vol 40, No 3, p. 321-328, 1972. 1 fig, 1 tab, 22 ref.

Descriptors: *Thermal pollution, *Invertebrates, *Phenols, *Inhibitors, *Respiration, Biochemistry, Water pollution, Environmental effects, Aquatic environments, Aquatic animals, Bethnic fauna, Freshwater, Pollutants, Heat, Metabolism, Laboratory tests, Measurement, Evaluation, *Snails.

The interactive influence of temperature and phenol (p-hydroxy benzene) on the rate of oxygen uptake for a freshwater snail, Helisoma trivolvis was investigated. Snails were collected en masse in early July 1969, and held in aquaria in dechlorinated tap water at 15 C. Twenty-four hours before tests, snails were transferred to another tank. Oxygen consumption was measured factorially at 0, 2.0, 20.0 and 40.0 mg/liter of phenol and at 5, 15 and 25 C temperatures. The analysis of variance indicated a highly significant value for the influence of phenol on oxygen uptake. This was most evident at 15 and 25 C; metabolic rate at 5 C was so slowed down that differences were impossible to measure. It appeared that all three phenol levels had a more or less uniform effect on oxygen consumption. The slow down of metabolic activities due to low temperatures was of the same magnitude as that due to a deleterious chemical. Snails exposed to as much as 40 mg phenol/liter for the three to four hour test period apparently recovered fully when returned to clean river water. (Jerome-Vanderbilt)
W73-13454

THE EFFECT OF TEMPERATURE ON THE DEVELOPMENT RATE OF THE MAJOR LIFE STAGES OF DIAPTOMUS PALLIDUS HERRICK,
Missouri Univ., Columbia. Div. of Biological Sciences.
W. T. Geiling, and R. S. Campbell.
Limnology and Oceanography, Vol 17, No 2, p. 304-307, March 1972. 2 fig, 14 ref. WP-00379.

Descriptors: *Temperature, *Growth rates, *Animal physiology, Juvenile growth stages, Invertebrates, Physiology, Biology, Environmental effects, Lakes, Eutrophication, *Copepods.
Identifiers: Development rate, *Eggs, Life stages, *Diaptomus pallidus.

Diaptomus pallidus Herrick were raised from the egg to adulthood at 10, 15, 20 and 25C under ad libitum feeding conditions. Times spent in the egg, nauplius, and preadult life stages were recorded. Egg to adult times ranged from 66.2 days at 10C to 14.6 at 25C. Development rate plateaued between 15 and 20C, largely because of the similarity in time spent in the preadult copepodid stages. Such a plateau, well documented for other temperature related physiological functions in invertebrates, is inconsistent with the suggestion that it may be possible to predict the entire range of temperature response of development rate for all stages of copepods using Belehradek's equation with certain minimal measurements. (Oleszkiewicz-Vanderbilt)
W73-13456

INVERSE COMPENSATION FOR TEMPERATURE IN OXYGEN CONSUMPTION OF THE HYLID FROG PSEUDACRIS TRISERIATA,
Colorado State Univ., Fort Collins. Dept. of Zoology.
G. C. Packard.
Physiological Zoology, Vol 45, No 3, p. 270-275, 1972. 1 fig, 3 tab, 23 ref.

Descriptors: *Metabolism, *Frogs, *Respiration, *Temperature, Biology, Animal physiology, Oxygen demand, Adaptation, Environmental effects, Resistance, Laboratory tests.

This investigation tests the hypothesis that, because the chorus frog (Pseudacris triseriata) remains active at low temperatures, partial compensation for temperature might be expected as a pattern of metabolic response to low temperature acclimation. Following acclimation to 5C or to 25C for at least 4 days, oxygen consumption of chorus frogs was measured at 10C or 20C by differential respirometry. Short-term compensation for temperature conformed with the pattern of inverse translation, frogs acclimated at the low temperature having lower metabolic rates than frogs acclimated at the high temperature. There is reason to believe that a temperature of 5C may have been sufficiently low to induce cold torpor in the animals, in which case inverse compensation may have been an adaptive response permitting conservation of energy reserves. (Jerome-Vanderbilt)
W73-13458

EFFECTS OF TEMPERATURE, SALINITY, AND DISSOLVED OXYGEN ON THE SURVIVAL OF STRIPED BASS EGGS AND LARVAE,
California State Dept. of Fish and Game, Sacramento. Anadromous Fisheries Branch.
J. L. Turner, and T. C. Farley.
California Fish and Game, Vol 57, No 4, p. 268-273, 1971. 4 tab, 8 ref.

Descriptors: *Striped bass, *Temperature, *Salinity, *Dissolved oxygen, *Reproduction, Water quality, Aquatic environment, Environmental effects, Fish eggs, Life cycles, Fish physiology, Laboratory tests, Test procedures, Measurements, Evaluation.

Laboratory tests were conducted to define the effects of temperature, salinity and dissolved oxygen on the eggs and larvae of striped bass in order to find what measures must be taken to protect the species from the increasing degradation of the freshwater environment. Adult striped bass were collected during their spawning migration and female fish were induced to ovulate. Eggs were collected, dry fertilized and placed into test containers. Some eggs were placed directly into test conditions, and others were water hardened first. Eggs were incubated at 18 salinity-temperature combinations. For the eggs placed directly into test conditions the survival was 88% or more of control in total dissolved solids of 1000 ppm. The highest survival occurred at 1000 ppm and 65 F, but survival decreased rapidly above 1000 ppm, especially at higher temperatures. The survival of eggs hardened in fresh water was higher at greater salinities and temperatures. In tests of the effects of dissolved oxygen-temperature, egg survival decreased with an increase of temperature or exposure time or a decrease in dissolved oxygen level. These experiments suggest that even moderate reductions of dissolved oxygen adversely affect the percents hatch of eggs and larvae survival. (Jerome-Vanderbilt)

THE EFFECT OF TEMPERATURE ON THE NUMBER OF CIRCULATING HEMOCYTES IN THE CALIFORNIA SEA HARE, APLYSIA CALIFORNIA,
National Marine Fisheries Service, Oxford, Md. Biological Lab.
G. B. Pauley, and S. M. Krassner.
California Fish and Game, Vol 57, No 4, p 308-309, 1971. 1 tab, 4 ref.

Descriptors: *Temperature, *Mollusks, *Metabolism, *Biological indicators, Aquatic environment, Animal physiology, Aquatic animals, Laboratory tests, Testing procedures, Measurements, Evaluation.
Identifiers: Blood cell count.

It was necessary to know the number of circulating hemocytes in the California sea hare in order to evaluate experimental results or pathological conditions. Observations of the total number of circulating blood cells at two different temperatures were made to obtain the needed information. Hemolymph was drawn from the engorged pedal sinus in 16 different animals of approximately equal size which had been held at 12 and 18 C for 1 week. This operation could be performed without trauma if the animal was held in a damp paper towel. The hemolymph was kept in sterile test tubes in an ice bath until cells were counted. Four counts were taken from each animal. Although the range of total hemocyte counts overlapped somewhat, the mean number of hemocytes present at 18 C (146-47 plus or minus 40.70) was nearly twice the number observed at 12 C (76.03 plus or minus 20.86). The total hemocyte values found in the California sea hare differ from those obtained for other mollusks, but, the temperature sensitivity compared favorably to studies of others. TEMPERATURE-DEPENDENCE OF PERMEABILITY TO WATER AND TO SODIUM OF THE GILL EPITHELIUM OF THE EEL ANGUILLA ANGUILLA,
Nice Univ. (France). Faculte des Sciences.
R. Motais, and J. Isaia.
Journal of Experimental Biology, Vol 56, No 3, p 587-600, June 1972. 2 fig, 6 tab, 31 ref.

Descriptors: *Eels, *Temperature, *Permeability, *Sodium, Biochemistry, Aquatic environment, Sea water, Freshwater, Aquatic animals, Metabolism, Diffusion, Flow, Transmissivity, Solutes, Evaluation, Animal physiology, Laboratory tests.
Identifiers: Blood, Gill.

In the eel, the gill rather than the skin is the principal water exchange surface. Previous results indicate that water crosses the gill of marine fish by simple diffusion and not by bulk flow. This study is an attempt to evaluate the importance of a possible solute-solvent interaction in the branchial epithelium of the seawater-adapted eel. The ratio of water permeability to sodium permeability is about 3 at 25 C, but drops to 1 at 5 C. This drop is mainly due to diminution of the water permeability. The relatively independent variations of permeabilities in the seawater-adapted fish indicate a certain dissociation between water and salt movements. The hypothesis concerning the presence of water-filled channels in the branchial epithelium of fresh water-adapted eels is supported. In the seawater-adapted eel the osmotic permeability is considerably higher than the diffusional permeability with the difference being greater the lower the temperature. This surprising result must signify either that the osmotic pressure difference between blood and seawater does not represent the true osmotic gradient or that a reabsorption of water linked with solutes occurs in a specialized region of the gill. (Jerome - Vanderbilt)

THERMAL EFFECTS ON AQUATIC ORGANISMS, ANNOTATED BIBLIOGRAPHY OF 1971 LITERATURE,
Oak Ridge National Lab., Tenn.
C. C. Coutant, E. E. Huber, and H. A. Pfuderer.
Available from the National Technical Information Service as ORNL-EIS-72-28, $3.00 in paper copy, $1.45 in microfiche. Report ORNL EIS 72-28, September 1972. 155 p, 404 ref.

Descriptors: *Thermal pollution, *Environmental effects, *Aquatic life, *Bibliographies, Water quality, Temperature, Aquatic environment, Algae, Bacteria, Annelids, Biomass, Biochemistry, Behavior, Metabolism, Reproduction, Respiration, Growth rates, Fish, Laboratory tests, On-site tests, Measurements, Data collections, Evaluation, Feeding rates, Estuaries, Streams, Rivers, Lakes, Ponds, Oceans.

A review of the literature of 1971 dealing with the problem of thermal effects on aquatic organisms is presented. Abstracts of 404 articles are included on the following topics: reviews; site studies; producers, including effects on growth and production, and community responses; consumers, including reproduction and development, distribution, temperature tolerance, physiology of cold shocks, tissue and organ responses, growth, food transport, temperature-salinity interactions, radionuclide uptake, temperature and other stresses, feeding rates, preferred temperature, avoidance, orientation, activity, and predator prey relations; decomposers; disease; beneficial uses; and bibliographies. Indexes of authors, key words and taxonomic names, are presented, along with a key-word-in-context index on titles. (Jerome - Vanderbilt)

A STUDY OF THE BLUE-GREEN ALGAE FROM PADDY FIELD SOILS OF INDIA,
Allahabad Univ (India). Dept of Botany
G. L. Tiwari
Hydrobiologia, Vol 39, No 3, p 335-350, May 19 1972. 3 tab. 24 ref.

Descriptors: *Cyanophyta, *Systematics, *Soil al gae, Soils, Sampling, Cultures, Bioindicators Anabaena, Nostoc
Identifiers: *India, Sample preservation, Sampl preparation, Culture media, Enrichment, Agar Microcystis spp, Gloeocapsa rupestris Gloeothece rupestris, Aphanocapsa spp Aphanothece spp, Dacylococcopsis fascicularis indica, Chamaesiphon rostafinsku, Arthrospir gomontiana var crassa, Spirulina major, Oscilla toria spp., Phormidium spp., Lyngbya spp., Micro cystis flos-aquae, Gloeothece spp., Aphanothec stagnina, Chroococcidiopsis mysorensis, Oscilla toria spp., Phormidium spp., Microcoleus spp Cylindrospermum spp., Nostoc spp., Anabaen spp., Scytonema spp., Microchaete spp Gloeotrichia spp., Hapalosiphon spp., Aulosir spp., Plectonema spp., Scytonematopsi ghazipurensis, Tolypothrix spp., Calothrix spp Symphyonemopsis katniensis, Hapalosiphon spp Westiellopsis prolifica.

Soil samples and algae were collected from ric fields in India in order to study the blue-green a gae. Collections were taken to a depth of one inc and were kept in sterilized Petri dishes fo preparation of enrichment cultures. Blue-gree algae found growing in the cultures were recorde and unialgal cultures obtained by direct isolatio or by streak cultures. A total of 132 forms were re ported including one new genus, three new spe cies, three new varieties, and 14 new form var ants. Of the total, 37.8 percent were from nature 48.4 percent obtained from culture, and 13.6 pe cent common to both. The study confirms earlie observations that soils contain a large number o viable algal species apart from those actually vis ble and that some algae reported from nature ma fail to appear under cultural conditions. Th heterocystous blue-green algae are seen less tha non-heterocystous in nature whereas in culture the condition is reversed. (Mortland-Battelle)

THE INTERACTION OF LIGHT INTENSITY AND DDT CONCENTRATION UPON THE MARINE DIATOM, NITZSCHIA DELICATISSIMA CLEVE,
Florida State Univ., Tallahassee. Dept. o Oceanography.
R. B. MacFarlane, W. A. Glooschenko, and R. C. Harriss.
Hydrobiologia, Vol 39, No 3, p 373-382, May 1 1972. 3 fig, 13 ref.

Descriptors: *DDT, *Light intensity *Phytoplankton, *Primary productivity Chlorinated hydrocarbon pesticides, Photosynthe sis, Water pollution effects, Chlorophyll, Carbon Cultures, Radioactivity techniques, Absorption Chrysophyta, Marine algae, Carbon radioisotopes
Identifiers: Nitzschia delicatissima, Chlorophyll a C-14.

A study was conducted to determine the effects o the interactions between DDT concentration an light intensity on marine phytoplankton wit respect to carbon-14 uptake, chlorophyll a con tent, and photosynthesis. Cultures of Nitzschi delicatissima were grown to concentrations o 75,000 cells per ml and DDT was then introduce in concentrations of 9.4, 23.5, 44, 88, 220, 500, an 1,000 ppb. Fifty-ml aliquots were placed in growth chamber at the desired light intensity an incubated for 24 hours and carbon-14 o chlorophyll a analysis was done. A consisten reduction in both C-14 fixation and chlorophyll was observed with increasing DDT concentra tions. Maximum reductions occurred at the highe

t intensities. However, since the lowest DDT centrations used were at least 100 times those orted in an estuarine study, it was concluded inhibition of primary production is probably occurring in nature except for very limited as, and then only in surface waters. (Mortland-telle)

E KINETICS OF NH4 UPTAKE BY RATOPHYLLUM,
ahoma State Univ., Stillwater. Dept. of Zoolo-

V. Toetz.

Hydrobiologia, Vol 41, No 3, p 275-290, 1973. 7 fig, 5 tab, 11 ref. OWRR A-023-OKLA (1), 14-31-0001-3836.

Descriptors: Lakes, *Ammonia, *Kinetics, *Eutrophication, *Oklahoma, Aquatic plants, Nutrients, Model studies, Ponds.
Identifiers: *Ceratophyllum.

The relationship between growth of aquatic plants and their nutrient supply is poorly understood, because of the lack of suitable models which could be tested in the field. The purpose of this research was to learn if the Michaelis-Menten expression describes the relationship between the uptake of NH4 in solution. A hyperbola results when uptake of NH4 by Ceratophyllum (v) is plotted against the concentration of NH4 in solution (S). The relationship is not described well by the Michaelis-Menten expression. Linear relationships exist between v and S at concentration less than 7 mg NH4-N (1)-1, suggests that a model for first order saturation kinetics might be appropriate. However, uptake is depressed by one half at low temperatures and some of the uptake is apparently related to processes which are not completely passive. The ecological usefulness of the Michaelis-Menten constants derived for Ceratophyllum is discussed.

Identifiers: *Colonization, *Logs, *Kaskaskia River, Riffles, Water mites, Planarians, Substrates, Chironomids, Black flies, Populus deltoides, Ulmus americana, Acer saccharinum, Fraxinus americana, American elm, Silver maple, White ash, Aeolosoma, Ostracods, Seed shrimp, Platyhelminthes, Glochidia, Pond snails, Oedogonium, Melosira, Navicula, Cyclotella, Spirogyra, Closterium, Pleurosigma, Turbellaria, Macronycus glabratus, Atrichopogon fusculus, Pleurocerca, Hemiptera, Water striders.

Development of invertebrate communities on log substrates was investigated in three habitats. In slowly moving, shallow water, standing crops (weights) of colonizing invertebrates followed a sigmoid growth curve during a 6-week exposure period. Initial colonization was rapid, followed by 2 weeks of slow growth, a rapid increase during the next 2 weeks, and then a leveling off at 1,650 mg/sq m during the final week. Numbers followed a similar pattern of growth, attaining a high of approximately 100,000/sq m by the end of the 5th week. Chironomid larvae colonized first and in the greatest numbers, followed sequentially by sessile rotifers and oligochaetes. These three organisms had the greatest influence on standing crops and total numbers. In a riffle, colonization was also rapid: 569 mg and 8,830 individuals per sq m at the end of four weeks. The riffle community was dominated by Taeniopteryx nivalis, hydropsychid larvae, chironomid larvae, and simuliid larvae. In a pool, the standing crop was largest on logs at an intermediate depth, next largest near the surface, and smallest near the bottom. The oligochaete, Aeolosoma sp., attained their largest population on logs at the greatest depth, while chironomid larvae and taeniopterygid naiads attained their largest populations at or above the intermediate depth. Communities on naturally occurring logs contained more planaria and insects of the families Hydropsychidae, Heptageniidae, and Elmidae than on the experimental logs in slowly moving, shallow water. Communities on the introduced logs did not reach a climax stage during the experimental period because organisms, organic detritus, and silt were constantly accumulating or sloughing off, the substrate was slowly decomposing, and changes were occurring seasonally in the chemical and physical condition of the water, all of which modified the habitat and influenced community development. ENERGY FLOW IN A WOODLAND STREAM ECOSYSTEM: II. THE TAXONOMIC COMPOSITION AND PHENOLOGY OF THE CHIRONOMIDAE AS DETERMINED BY THE COLLECTION OF PUPAL EXUVIAE,
Pittsburgh Univ., Pa. Pymatuning Lab. of Ecology.
W. P. Coffman.
Archiv fur Hydrobiologie, Vol 71, No 3, p 281-322, March 1973. 11 fig, 6 tab, 45 ref.

Descriptors: *Life cycles, *Systematics, *Phenology, *Biorhythms, *Pennsylvania, *Midges, Biological communities, Invertebrates, Benthic fauna, Aquatic insects, Life history studies, Growth stages, Period of growth, Energy conversion, Diptera, Aquatic drift, Sampling, Water temperature.
Identifiers: *Linesville Creek, Species diversity, Macroinvertebrates, Drift organisms, Flies, Emergence, Acricotopus, Brillia cf. brevinervis, Cardiocladius, Corynoneura, Cricotopus spp, Corynoneura-Thienemanniella, Diplocladius, Epoicocladius, Eukiefferiella (Akiefferiella spp, Eukiefferiella brevicalcar, Eukiefferiella discoloripes, Heleniella, Eukiefferiella lobifera, Eukiefferiella spp, Heterotrissocladius spp, Krenosmittia cf. camptophleps, Limnophyes, Metriocnemus, Microcricotopus spp.

The taxonomic composition and phenology of the chironomid community of a small woodland stream in eastern Northern America were investigated by the utilization of natural collections of surface drifting pupal exuviae. Based on pupal identifications 143 chironomid taxa were recognized: Orthocladinae (83), Chironomini (25), Tanytarsini (21) and Tanypodinae (14). A total of 34 patterns of emergence were summarized in six major and three minor types. Almost all Orthocladiinae species had an emergence period in the late winter to mid-spring months. The other major taxa generally appeared later with the Chironomini and Tanypodinae being the most extreme. The onset of the emergence of the major taxa coincided sharply with the spring water temperature increase, the attainment of the maximum summer temperature and the period of maximum diel temperature fluctuation. Preliminary experiments on the decomposition of exuviae indicate that they remain floating for about two days. The quantification of the collecting method is discussed in conjunction with its possible use in benthic production studies. A short review of recently published work on the chironomid pupal life stage is included. (See also W71-10064). (Little-Battelle)

DIFFERENTIATION OF MYCOBACTERIUM TUBERCULOSIS FROM OTHER MYCOBACTERIA BY SUSCEPTIBILITY TO ETHYL AND METHYL ESTERS OF P-NITROBENZOIC ACID,
Chubu Chest Hospital, Obu (Japan).
M. Tsukamura.
Japanese Journal of Microbiology, Vol 17, No 1, p 81-82, January 1973. 1 tab, 4 ref.

Descriptors: *Separation techniques, *Cultures, *Mycobacterium, Pathogenic bacteria, Growth rates, Inhibitors, Resistance.
Identifiers: *Nitrobenzoate, Culture media, p-Nitrobenzoate acid ethyl ester, Nitrobenzoate acid methyl ester, Mycobacterium spp.

Studies have shown that p-nitrobenzoate is useful in screening for atypical mycobacteria (other than tubercle bacilli). Since p-nitrobenzoate is not commercially available the present study was conducted to find commercial chemicals to serve the same purpose. The chemicals studied were the ethyl and methyl esters of p-nitrobenzoate. Twenty-two species of mycobacteria were cultured in Ogawa egg medium containing one of the two compounds in concentrations of 0.25 or 0.5 mg/ml. Almost all mycobacteria except Mycobacterium tuberculosis and Mycobacterium bovis were resistant to the compounds. Mycobacterium bovis was able to grow on the medium containing 0.25 mg/ml of either compound whereas Mycobacterium tuberculosis usually was not. Using a medium containing 0.25 mg/ml ethyl ester of p-nitrobenzoate, 26 strains of a typical mycobacteria other than Mycobacterium tuberculosis were detected from a total of 370 unknown mycobacteria. This study has attempted to establish factors affecting the distribution of algae in hard and soft waters through a study of the cultural requirements of algae of known distribution in these waters. The natural distributions of the species used in the experiments are described, and the effects of some major cations on growth are examined. Introducing a series of papers examining the reasons for the distribution of freshwater algae in eutrophic and oligotrophic water, this paper outlines the natural distribution of some of thirty-three species studies experimentally. Two groups of species are objectively delineated, one (oligotrophic) whose members are restricted to waters with not more than 1.5 m-equiv/l weak acid salts (Bicarbonate), the other (eutrophic) with members present in waters with 0-4 or more m-equiv/l weak acid salts. The ratio of monovalent to divalent cations did not affect growth of five test species. High calcium levels (100 mg/l) did not reduce growth of oligotrophic desmids, and 1.0 mg Ca (2 plus)/l was adequate for maximum growth of sixteen species tested. Two oligotrophic desmids required at least 1-3 mg Ca (2 plus)/l for maximum growth. No evidence was found for the contention that oligotrophic desmids are calciphobic. (Little-Battelle)

THE SEASONAL CYCLE OF PHEOPIGMENTS IN LAKE ONTARIO WITH PARTICULAR EMPHASIS ON THE ROLE OF ZOOPLANKTON GRAZING,
Department of the Environment, Burlington (Ontario). Centre for Inland Waters.
W. A. Glooschenko, J. E. Moore, and R. A. Vollenweider.
Limnol Oceanogr. Vol 17, No 4, p 597-605, 1972. Illus.
Identifiers: Biomass, Canada, Cycle, *Lake, Ontario, *Pheo-pigments, Phytoplankton, Pigments, Seasonal, *Zooplankton grazing.

The annual cycles of chlorophyll a, pheo-pigments, and zooplankton in Lake Ontario were studied on 32 stations during 13 cruises in 1970. Highest amounts of chlorophyll a were found in inshore waters. The seasonal cycle of phytoplankton biomass as measured by chlorophyll a showed three patterns: a unimodal distribution in the deeper waters which are last to warm up in late spring; a bimodal pattern, with spring and fall peaks, mainly along the central basin and north and south shores; a series of 3 pulses in nutrient-rich areas and in the warmer eastern region of the lake. Zooplankton biomass increased eastward in the direction of increasing heat content. Pheo-pigments were low during the spring increase of phytoplankton, but their amount relative to that of chlorophyll a was significantly correlated ($r \pm +0.896$) with zooplankton abundance. Highest pheo-pigments were found in the eastern basin of the lake. The need to correct chlorophyll a values for pheo-pigments is emphasized especially when zooplankton grazers are abundant.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: *Aquatic plants, Ceratophyllum demersum, Chara tomentosa, *Flad, Myriophyllum spicatum, Najas marina, Oxygen, Phosphorus, Phragmites communis, *Sweden (Stockholm Archipelago), Vegetation, Bays, Hydrogen ion concentration.

Aquatic macrovegetation was studied and mapped in a shallow sheltered bay (sw. flad) in northern Stockholm Archipelago, central Sweden, during the years 1966-1969. The flad is surrounded by a thick girdle of mostly Phragmites communis. The submerged vegetation is characterized by large meadows of Chara tomentosa and Najas marina. During the first 3 yr it also consisted of luxuriant stands of Myriophyllum spicatum and Ceratophyllum demersum. The bottom consists of gyttja, with the exception of a small area near the southern shore. The distribution and changes of 16 aquatic species are discussed, together with water analyses of pH, oxygen, and total-P.--Copyright 1973, Biological Abstracts, Inc.

OXIDATION REDUCTION POTENTIALS, OXYGEN CONCENTRATION AND OXYGEN UPTAKE OF PROFUNDAL SEDIMENTS IN A EUTROPHIC LAKE,
Bedford Inst., Dartmouth (Nova Scotia). Marine Ecology Lab.
B. T. Hargrave.
Oikos. Vol 23, No 2, p 167-177. 1972. Illus.
Identifiers: *Denmark (Lake Esrom), *Eutrophic lakes, *Oxidation, Oxygen, *Sediments (Profundal), Oxidation reduction.

Oxidation-reduction potentials were measured with a 1-mm platinum electrode in undisturbed sediment cores and re-settled mud from Lake Esrom, Denmark. Slow stabilization of Eh potentials occurred at the aerobic-anaerobic interface. Seasonal changes in Eh profiles in profundal sediments only occurred in the upper 1 cm during summer stratification. When O2 disappeared, reducing conditions reached the sediment surface. In artificial mud-water systems, no measurable O2 occurred when Eh values in either sediment, or water or both, fell below + 100 mv. O2 uptake by mud taken from various depths of sediment cores was inversely related to Eh potential. Eh and the square root of O2 uptake by sub-surface mud dur-

aeration showed a similar inverse proportionality, suggesting that intensity and capacity of consumption are related. Formalin addition uced O2 uptake by sediment from the surface undisturbed cores by 80%. Below 1 cm all O2 s consumed by chemical processes. Eh potenmay index both the intensity and capacity of h relations.--Copyright 1973, Biological Abacts, Inc.

RASITE FAUNA OF DIFFERENT FORMS OF E ARCTIC CHAR, SALVELINUS ALPINUS FROM KAMCHATKA, (IN RUSSIAN),
ademiya Nauk SSSR, Vladivostok. Institut rskogo Biologii.
T. Makhovenko.
azitologiya. Vol 6, No 4, p 369-375, 1972. Enh summary.
ntifiers: *Arctic char, Ecological studies, *Fauparasite, Forms, *Kamchatka (USSR), asites, Salvelinus-alpinus, USSR.

ır freshwater forms and 1 anadromous form of Arctic char were recorded from Lake abachye (Kamchatka) (USSR). The forms init different ecological niches and differ in their asite fauna. Certain parasites can be used as inators of these forms. Further investigations in field will provide an elaboration of a new thod for differentiation of the Arctic char forms means of parasite indicators.--Copyright 1973, logical Abstracts, Inc.

ASUREMENTS OF MICROALGAL PRIMAPRODUCTION (PHYTOPLANKTON AND CROBENTHOS) IN THE SMALANDSHAVET ENMARK),
ddevandsudvalget, Soborg (Denmark).
Gargas.
nelia. Vol 10, No 1, p 75-89, 1972. Illus.
ntifiers: Algal, *Benthos, *Denmark (Smadshavet), Measurement, *Phytoplankton, *Primary production, Waste waters, Dissolved oxygen.

Measurements of the production of organic matter by the microalgae (phytoplankton and microbenthos) have been carried out in the Smalandshavet-a shallow water area in the southern part of Denmark. Measurements of dissolved O2 and the vertical penetration of the green light were also made. The area investigated can be divided into 2 parts, and open area with a good exchange of water and an enclosed fjord with poor possibilities of water renewal. Both areas are recipients for loaded waste waters. None of the areas investigated had high microalgal production. The ineffective water exchange in the fjord makes the watermass very sensitive to larger amounts of O2-consuming substances. Because of outlet of sewage the concentration of dissolved O2 is low and the turbidity high. This restricts biological diversity. Calculations show that the O2 deficit observed is mainly due to loaded O2-consuming substances. The decomposition of in situ produced organic matter is of less importance.--Copyright 1973, Biological Abstracts, Inc.

CHLOROPHYLL CONTENT AND PRIMARY PRODUCTION OF SESSILE ALGAL COMMUNITY IN MOUNTAIN STREAM CHIGONOZAWA RUNNING CLOSE TO KISO BIOLOGICAL STATION OF THE KYOTO UNIVERSITY,
Tokyo Univ. of Education (Japan). Dept. of Botany.
H. Kobayasi.
Mem Fac Sci Kyoto Univ Ser Biol. Vol 5 No 2, p 89-107, 1972. Illus.
Identifiers: Algae, Biological studies, Chigonozawa, *Chlorophyll, *Japan, Light, Mountain stream, Photosynthesis, *Primary production, Respiration, Running, *Sessile algae, Streams.

The chlorophyll standing crops and the photosynthesis-light intensity curves of the sessile algal communities, together with the light condition in the environments (measured with celestial photographs), were measured during 1964-1966 in the stream Chigonozawa (Japan), flowing in the montane region of central Japan. Algal communities were mainly composed of blue-greens and diatoms. A linear correlation between light condition and chlorophyll content was found. The annual mean value of chlorophyll content was 0.030 g/m2 and the annual gross production was estimated to be 0.13 kg . glucose/m2. Average annual values for the whole water course for total sum of the gross production, the amount of respiration and the net production were 86.45 kg . glucose, 53.68 kg . glucose and 32.78 kg . glucose, respectively. The photosynthesis-light intensity curve was a shade-type one with marked photo-inhibition both in summer and autumn (Ik was ca. 3200 lux).--Copyright 1973, Biological Abstracts, Inc.

PARASITES OF COMMON FISHES FROM IRAQ WITH SPECIAL REFERENCE TO LARVAL FORM OF CONTRACAECUM (NEMATODA:HETEROCHEILIDAE),
Biological Research Centre, Baghdad (Iraq).
M. Shamsuddin, I. A. Nader, and M. J. Al-Azzawi.
Bull Biol Res Cent (Baghdad). No 5, p 66-78, 1971. Illus.
Identifiers: Barbus-esocinus, Contracaecum, Fish parasites, Gill, *Heterocheilidae, Ichthyopthirius-sp, *Iraq, Larva mugil-abu, *Nematoda, Parasites, Pathology, Piscicola-sp, Silurus-triostegus, Trichodina-sp.

A total of 47 fishes belonging to 3 families, Cyprinidae, Siluridae and Mugilidae, were examined for various parasites. Protozoan parasites such as Ichthyopthirius sp. were rarely found but Trichodina sp. was commonly recovered from all fishes. Protozoan blood parasites were not seen and the fishes were nearly negative for parasites of the groups Acanthocephala, Hirudinea and Crustacea. Two species of the genus Barbus, however, suffered heavy gill-infection with Piscicola sp. during late spring and summer only. Larval cestodes were recovered only in 1 instance from B. esocinus and mature cestodes were obtained once from Silurus triostegus. In general, larval nematodes were found in most fishes but S. triostegus and Mugil abu suffered heavily. Notes on the larval nematodes, their seasonal variation, effects on fishes and biology and identification of Contracaecum are discussed.--Copyright 1973, Biological Abstracts, Inc.

A NEW NEMATODE SPECIES IN CARP WATERS OF THE WEST REGIONS OF UKRAINE,
Zooveterynarnyi Instytut, Lvov (USSR).
V. M. Ivasik, B. G. Svirepo, R. V. Skovronskii, and N. I. Vorona.
Helminthologia (Bratisl). 10, p 181-183, 1969 (1971).
Identifiers: *Carp, Cyclops-coronatus, *Nematode, Philometra-lusiana, Species, *Ukraine, USSR.

Philometra lusiana Vismans, which causes philometrosis in carp, was first observed in 1960 in Latvia, and in recent years has infected carp in the western regions of the Ukraine. Fish are affected in June, and the length of the life cycle is about 1 year. In order to study the biology of this parasite, helminth larvae obtained from female animals were incubated at 20 degrees with Cyclops coronatus, and were observed every 2-3 days. By the 6th day they became less mobile; on the 11th day 70% of the larvae died; and on the 14th day 100%. Research showed that fish were affected after eating an intermediary host (e.g., C. coronatus) infested with P. lusiana larvae. Other intermediate hosts were found. Effective measures for combatting philometrosis in carp have not yet been developed.--Copyright 1973, Biological Abstracts, Inc.

SANGUINICOLOSIS IN CARP IN THE WINTER,
Zooveterynarnyi Instytut, Lvov (USSR).
V. M. Ivasik, and B. G. Svirepo.
Helminthologia (Bratisl), 10, p 103-105, 1969 (1971).
Identifiers: *Carp, Chilodonella-cyprini, Dactylogyrus-anchoratus, Dactylogyrus-extensus, Lymnaea, Myxobolus-dispar, Radix, *Sanguinicola-inermis, Sanguinicolosis, Trichodina-pediculus, USSR, Valvata, Winter.

The agent for sanguinicolosis in carp--Sanguinicola inermis Plehn, 1905, is encountered in many parts of the USSR, including the western regions. The development of the parasite is complex, involving molluscs (Lymnaea, Radix, Valvata) as an intermediate host. Outbreaks of sanguinicolosis were observed most frequently in June, July, and less frequently in August. The parasite produces eggs from May-Nov. The number of adult parasites in gills of 1 fish was 3-120; in the heart, 1-10. Observations made in Feb., 1965 revealed that fish were infested to some extent by the following parasites: Myxobolus dispar, Trichodina pediculus, Chilodonella cyprini, Dactylogyrus anchoratus, Dactylogyrus extensus. During sanguinicolosis, Hb was reduced by 20% in mild cases and 61% in serious cases. In mild cases serum protein was 69.6% lower; albumin and beta-globulin decreased. In serious cases, alpha-globulin increased. In the winter period, sanguinicolosis in carp lead to significant physiological changes. In order to combat this disease, the cycle of parasite development must be broken by eliminating the mollusc intermediate host and also by periodic summering in streams.--Copyright 1973, Biological Abstracts, Inc.

NATURAL TULAREMIA FOCI STRUCTURE IN THE FLOODLANDS OF SMALL AND MEDIUM RIVERS. II. EPIZOOTOLOGIC NATURE OF ELEMENTARY FOCI (IN RUSSIAN),
V. L. Adamovich.
Zh Mikrobiol Epidemiol Immunobiol, Vol 48, No 10, p 108-113, 1971, Illus, English summary.
Identifiers: Arvicola-terrestris, *Epizootologic studies, *Floodlands, Insects, Rivers, *Tularemia foci, *Diesna River (USSR).

Elementary tularemia foci localized in terraces over the flood-lands of Diesna river resemble the forest, premountain-spring and forest-swamp foci. Biocenoses of the meadow flood-land convert the splashes of the infection from the elementary foci into a flood-land focus. The name valley-river focus is suggested for a flood-land focus on Diesna; epizootologic significance of such focus is associated not with the population of Arvicola terrestris L. and water regimen, as large rivers, but is determined by complicated processes of fluctuation of the infection on the terrace slopes. Epidemiologic prognosis should proceed not from the population of A. terrestris L., but from the general epizootic situation in the river valley, intensity of flight of blood-sucking insects and immunity in the human population.--Copyright 1973, Biological Abstracts, Inc.

MATERIALS FOR HYGIENIC ASSESSMENT OF SALT COMPOSITION IN DRINKING WATER: VI. EFFECT OF CONSUMPTION OF MAGNESIUM SALTS WITH DRINKING WATER ON OSSIFICATION PROCESSES IN GROWING ANIMALS,
Vsesoyuznyi Nauchno-Issledovatelskii Institut Zheleznodorozhnoi Gigieny, Moscow (USSR).
I. S. Kandror, K. G. Basmadhzieva-Tancheva, and A. Tomov.
J Hyg Epidemiol Microbiol Immunol (Prague), Vol 15, No 4, p 462-468, 1971.
Identifiers: Hygienic studies, *Magnesium salts, *Ossification, Osteoporosis, Rats, *Salt, X-Ray, *Potable water.

Experiments were performed on white rats of the Wistar line which consumed drinking water with Mg salt concentration of 100 and 500 mg/l. The animals were maintained on a balanced diet. The content of Mg in the bone ashes increased 2-4 times as compared with the control animals (10 mg/l) at a certain decrease of Ca content. At a concentration of 500 mg/l, the Ca content in bone ashes decreased to 1/3. X-ray examination of tubular bones demonstrated moderate osteoporosis of Ca deficiency type in the metaphyses. Drinking water containing Mg salts in excess (100 and 500 mg/l) may compensate lack of Mg in food products. In general, an excess of Mg salts in the ration did not necessarily cause all excessive Mg to be eliminated from the organism. A part of it was deposited in the bone tissue replacing Ca in hydroxyapatite crystals and led to the manifestations of osteoporosis. The data yield a basis for the determination of the norm of Mg salt content in drinking waters in the international standard of drinking water quality.--Copyright 1973, Biological Abstracts, Inc.

INTESTINAL INFECTION CARRIER SURVEY IN DIYARBAKIR: I. (IN TURKISH),
C. Yumul, and O. Gulesen.
Mikrobiyol Bul, Vol 6, No 2, p 199-204, 1972, English summary.
Identifiers: Escherichia-coli, Human infection, *Intestinal infection, Klebsiella, Salmonella, Shigella, Survey, *Turkey (Diyarbakir), Vibrio-cholerae, *Bacteria.

There was an increase in the rate of intestinal infections, in Diyarbakir, Turkey, during the autumn months of 1971. A carrier survey was made. Samples of feces were taken from 273 soldiers of the regional gendarmerie unit. Four carriers (2 Shigella and 2 Salmonella) were found and treated. ehere was no Vibrio cholerae carrier. The gendarmerie unit was quartered near a spring, and the water from the spring was used. Samples of spring water were examined bacteriologically. Escherichia coli and Klebsiella were found in the water samples. Advice was given to chlorinate the water. In organized communities, there might be intestinal infection carriers in significant numbers.--Copyright 1973, Biological Abstracts, Inc.

5D. Waste Treatment Processes

COST OF WASTE WATER POLLUTION ABATEMENT IN POULTRY PROCESSING AND RENDERING PLANTS IN GEORGIA,
Georgia Univ., Athens. Dept. of Agricultural Economics.
W. R. Kerns, and F. J. Holemo.

Available from the National Technical Informa tion Service as PB 222 506, $3.00 in paper copy $1.45 in microfiche. Environmental Resource Center, Georgia Institute of Technology, Atlanta Report ERC-0673, June, 1973. 39 p, 18 tab, 11 re OWRR A-038-GA (1) 14-31-0001-3810

Descriptors: Water pollution control, *Poultry *Industrial wastes, Economic impacts, Environ mental effects, Waste disposal, Food processin industry, *Georgia, *Treatment facilities, *Was treatment, Waste water treatment.
Identifiers: *Poultry processing wastes, Renderin Plants.

Information on pollution control practices was o tained from 26 poultry processing plants and nin by-products plants in Georgia. Data were obtaine on plant size and type of operation, approaches waste treatment, expenditures, degree of enviro mental control achieved, and the disposition of b products. Each plant can balance the cost process changes to reduce waste generation wi the cost of waste treatment. Plants with access to public sewerage service can balance sew changes against their other costs. The industry making substantial expenditure of all three kind Processing plants are spending an average $10,800 annually for waste reduction and was treatment equipment, an amount equal to $0.88 p 1,000 birds processed. Average annual operati and maintenance expenses (for both types equipment plus service charges) are $16,900 p plant and $1.35 per 1,000 birds processed. Es mates were also made of the cost of utilizing t best available control technology. For plants e ploying their own treatment systems, it was es mated that annual equipment expenditures wou increase by a factor of 3.2 and that operation a maintenance expenditures would increase by factor of 5.8. The initial expenditure for n equipment could run as high as $23 per 1,000 bi processed. Public service charges could triple c rent rates. Most plants indicated that current tre ment expenses have had little effect on produ prices and profits; however, both may be affect as higher water quality standards require more a vanced pollution control technology. (James-Ge gia)

STUDY OF GAMMA INDUCED LOW TE PERATURE OXIDATION OF TEXTILE E FLUEHNTS,
Oak Ridge National Lab., Tenn. Isotop Development Center.
F. N. Case, and E. E. Ketchen.
Copy available from GPO Sup Doc EP1.23/2:73-260, $0.90; microfiche from NTIS PB-222 621, $1.45. Environmental Protecti Agency, Technology Series Report EPA-R2-260, May 1973. 60 p, 9 fig, 27 tab, 6 ref. EPA P ject 12090 FWD.

Descriptors: Color, *Oxidation, *Chemical ygen demand, *Gamma rays, Radiation, *P wastes, Dyes, *Waste water treatment.
Identifiers: *Color removal, Textile effluen *Charcoal reactivation.

Gamma irradiation of textile mill effluents un oxygen pressures up to 1500 psi, with and with activated charcoal present, was studied as method for removing color and removal of s stances contributing to the chemical oxygen mand (COD). Both color and COD reduction directly related to the radiation dose and press of the oxygen over the dye solution samples dur irradiation. Color removal was achieved in so tions of dye prepared in the laboratory for proc evaluation and for authentic textile mill waste fluents; however, the variation in the radiat dose required for various dye compounds large. The study revealed a new method for in- reactivation of charcoal by gamma-radiation duced oxidation of organic compounds adsor

on charcoal. This discovery permits a large reduction in the gamma source size required for processing textile mill effluents because the water fraction of the effluent does not need to be irradiated to the same degree as the organic material contained in the effluent. A mathematical model for the process, developed late in this study, has not yet been experimentally verified. (EPA)

UPTAKE OF MERCURY BY YEAST CELLS,
Cornell Univ., Ithaca, N.Y.
A. Ramalingam.
M Sc Thesis, January 1973. 59 p, 17 fig, 13 tab, 15 ref. OWRR-A-039-NY (2).

Descriptors: *Mercury, *Waste water treatment, *Yeasts, *Biological treatment, *Water pollution treatment, Water pollution control, Water treatment, Sorption, Magnesium, Iron, Operating costs.

Mercury uptake by yeast cells depleted in magnesium and/or iron was studied with a view to developing a biosorption process for removal of mercury. Mercury uptake was highly variable and no clear trend was observed with different media. Yeast absorbed mercury up to 1% of the dry cell weight. The mercury content of the cells increased as the mercury content of the contacting solution dropped from 20 ppm to 1 ppm. The fact that only a part of the mercury was reversibly bound suggests that more than one binding mechanism is operating. About 11.55 gm of yeast per liter of waste was necessary for reducing the mercury level from 60 ppm to 7 ppm. It is suggested that the process be combined with another treatment, for example, ion exchange, for economic operation. The operating costs would be rather high, amounting to about $20.00 per 1000 gallons for a plant to treat 15,000 gallons per day. (Knapp-USGS)
W73-13030

SECONDARY SEWAGE TREATMENT IN PIPELINE CONTACTORS,
Delaware Univ., Newark. Dept. of Chemical Engineering.
W. F. Russell.
Canadian Journal of Chemical Engineering, Vol 50, p. 179-184. April 1972. OWRR-A-008-DEL (3).

Descriptors: *Sewage treatment, Pipelines, *Oxygenation, Mathematical models, *Waste water treatment, *Sewage, Design, Tubes.

The preliminary design steps for a secondary sewage treatment process are discussed in a case study format. A tubular contactor with an oxygenator and reactor section is proposed as an alternate design to the conventional open tank process.

ACTIVATED SLUDGE MODIFICATIONS FOR ENHANCEMENT OF TRICKLING FILTER PLANT PERFORMANCE. I. DESIGN, OPERATION, AND BOD REMOVAL IN THE UNITS. II. NITRIFICATION,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
D. E. Francisco, L. W. Little, and J. C. Lamb, III.
UNC Wastewater Research Center Report No 18, April 1971. 43 p, 10 fig, 6 tab, 24 ref. EPA Project 11010 DGA. 14-12-505.

Descriptors: *Waste water treatment, *Treatment facilities, *Trickling filters, Filtration, Design, Operations, *Activated sludge, *Nitrification, *Biochemical oxygen demand.

Enhancement of trickling filter plant performance by subsequent activated sludge treatment was investigated. Five activated sludge pilot plants, each consisting of aeration tank and settling tank with air lift sludge return, were fed trickling filter effluent at a constant rate (300 ml/min). Hydraulic detention times in the aeration units were 0.4, 1.7, 4.0 and 9.2 hrs. Temperature was maintained at 25C. Effects of pH control, sludge wasting, and detention time were evaluated. Results indicated that activated sludge treatment substantially increased overall BOD, COD, organic carbon, and MBAS removals. At detention times of at least 1 hr significant nitrification was achieved. Control of pH with NaHCO3 improved nitrification efficiency; however, substantial nitrification was achieved at pH levels below 7. Control of wasting and of return sludge was necessary for optimum BOD, COD, and organic carbon removals and for optimum nitrification.
W73-13086

VARIATIONS IN CHARACTERISTICS OF WASTEWATER INFLUENT AT THE MASON FARM WASTEWATER TREATMENT PLANT, CHAPEL HILL, NORTH CAROLINA,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
R. L. Hanson, W. C. Walker, and J. C. Brown.
UNC Wastewater Research Center Report No 13, December 1970. 47 p, 7 fig, 23 tab, 12 ref. EPA Project 11010 DGA. 14-12-505.

Descriptors: Waste water treatment, *Treatment facilities, *Waste identification, *North Carolina, *Domestic wastes, Waste water (Pollution), *Organic loading.
Identifiers: *Chapel Hill (N.C.).

Variations in characteristics of wastewater from the Town of Chapel Hill (N.C.) were studied. Composite samples of domestic wastewater influent were collected at 2-hr intervals over 24-hr periods on each of the seven days of the week so that diurnal variations in flow and constituent concentrations and loadings could be observed. Samples were analyzed for BOD, COD, TOC, nitrogen, phosphorus, MBAS, and specific solids and metal constituents. Influent flow was found to vary from 30 to 144% of average with the maximum flow occuring between 1000-1200 hours and the minimum flow between 0400-0600 hours. Wastewater constituents showed a wide range of concentrations and loadings. Generally maximum concentrations and loadings occurred between 1000-1400 hours and the minimum values between 0600-0800 hours. The ratio of maximum to minimum concentrations for the constituents varied from 4-12 to one; for loadings, from 10-20 to one. (Little-North Carolina)

PROCESS DESIGN MANUAL FOR PHOSPHORUS REMOVAL,
Black and Veatch, Kansas City, Mo.

Available from the Environmental Protection Agency, Office of Water Programs, Technology Transfer, Washington, D.C., in microfiche from NTIS on PB-214 553 for $1.45. Environmental Protection Agency, Technology Transfer Manual, October 1971, 195 p. EPA Project 17010 GNP, Contract 14-12-936.

Descriptors: Phosphorus, *Chemical precipitation, Eutrophication, *Coagulation, *Flocculation, *Settling basins, *Filtration, *Mixing, Dewatering, Sludge treatment, Solids contact process, Tertiary treatment, Municipal wastes, *Waste water treatment.
Identifiers: *Phosphorus removal, Alum, Ferrous, Ferric, Lime treatment, Sodium aluminate, Pickle liquor, Dual media, Multimedia, Thickening.

The discharge of phosphorus-containing wastewaters into the surface waters of the United States has contributed to their over-fertilization and eutrophication. As a result, efforts are now being made to remove phosphorus from wastewater. This manual discusses phosphorus removal methods that have been found effective and practical for use at treatment plants. All the methods included involve chemical precipitation of the phosphorus and removal of the resultant precipitate. Precipitants include salts of aluminum and iron, and lime. The practical points of addition are before the primary settler, in the aerator of an activated sludge plant, before the final settler, or in a tertiary process. Included in the discussion of each treatment method is a description of the method, pilot or full-scale performance data, equipment requirements, design parameters, and costs. This information should be of value to designers, municipal officials, regulatory agencies, city planners, and treatment plant operators. (Brunner-EPA)
W73-13129

PROCESS DESIGN MANUAL FOR SUSPENDED SOLIDS REMOVAL.
Burns and Roe, Inc., Oradell, N.J.

Available from Technology Transfer, appropriate E.P.A. Regional Office; in microfiche from NTIS as PB-214 551 for $1.45. Environmental Protection Agency, Technology Transfer Manual, October 1971, 149 p. EPA Project 17030 GNO, Contract 14-12-930.

Descriptors: *Waste water treatment, *Treatment facilities, *Tertiary treatment, Chemical precipitation, Coagulation, Diatomaceous earth, Filtration, Flocculation, Flotation, Membrane processes, Settling basins, Solids contact process.
Identifiers: *Design considerations, *Operation requirements, *Cost estimates, Chemical feeding, High-rate settlers, Microscreening.

This manual comprises a compilation of information on the practice of suspended solids removal from municipal wastewaters. General engineering considerations are cited with respect to their impact on the design of treatment facilities. Specific processes utilized for suspended solids removal are described, discussed and illustrated through the use of data from installations which have employed these processes. Current technology and advanced methods of treatment are stressed in order to provide usable information for implementation in design of new treatment facilities. Some aspects of the operation and maintenance requirements of the described unit processes are delineated, along with the overall estimated costs of construction and operation. The information and data provided are presented in such a manner that they can be readily incorporated into practice. (Kreissl-EPA)
W73-13130

PROCESS DESIGN MANUAL FOR CARBON ADSORPTION.
CH2M/Hill, Corvallis, Oreg.

Available from Environmental Protection Agency, Regional Offices, Technology Transfer; in microfiche from NTIS as PB-214 552 for $1.45. Environmental Protection Agency, Technology Transfer Manual, October 1973, 195 p. EPA Project 17020 GNR.

Descriptors: *Waste water treatment, *Treatment facilities, *Activated carbon, Adsorption, Biodegradation, Dewatering, Filtration, Tertiary treatment.
Identifiers: *Carbon regeneration, *Design parameters, Cost estimates, Operation requirements, Organic removal, Physical-chemical treatment.

Activated carbon adsorbs a great variety of dissolved organic materials found in wastewater, including many which are resistant to biodegradation in conventional biological wastewater treatment plants. Carbon's great efficiency in organic removal has promoted its use for upgrading conventional plant performance. Successful use of carbon in tertiary treatment has led to proposals that it be used for secondary treatment as well, i.e., as a replacement for biological treatment. In the latter instance, activated carbon would be used as one portion of a larger physical-chemical treatment plant. This manual, a revision of the 1971 manual by Swindell-Dressler Co., Pittsburgh, Penn., examines major design parameters and unit operations (including pretreatment) which are important in carbon adsorption systems. Existing carbon plant designs are evaluated. Costs are evaluated for the various unit operations. Various plant configurations are discussed. Carbon regeneration (a prerequisite for economic feasibility) is discussed and the necessary equipment is described. Other aspects discussed include: air pollution control devices for the regeneration furnace, personnel requirements, isotherm and pilot testing, carbon dewatering, biodegradation of organics in carbon columns. (EPA)

PROCESS DESIGN MANUAL FOR UPGRADING EXISTING WASTEWATER TREATMENT PLANTS.
Weston (Roy F.), Inc., West Chester, Pa.

Available from: EPA Regional Office Technology Transfer; in microfiche from NTIS as PB-214 550 for $1.45. Environmental Protection Agency, Technology Transfer Manual, October 1971, 275p. EPA Project 17090 GNQ, Contract 14-12-933.

Descriptors: *Waste water treatment, Optimization, *Treatment facilities, *Sewage treatment, *Biological treatment, *Performance, *Control systems, Activated sludge, Aeration, Associated costs, Centrifugation, Chemical precipitation, Design criteria, Disinfection, Filtration, Flocculations, Lagoons, Monitoring, Odor, Operation and maintenance, Organic loading, Oxygen requirements, Sampling, Separation techniques, Sludge digestion, Sludge treatment, Trickling filters, Water quality.
Identifiers: Chemical treatment, Physical treatment, Recirculation, Effluent polishing, Clarifiers, Contact stabilization, Step aerations, Oxygen aeration.

The main purposes of this manual are to examine situations that necessitate upgrading of existing municipal wastewater treatment plants and to discuss and evaluate the corrective actions that are required to upgrade these existing plants. Upgrading to overcome organic and hydraulic overloadings and/or to meet more stringent treatment requirements is considered. The information presented is specifically adapted to plants having capacities of less than 5 mgd. This particular capacity was selected because most of the existing municipal wastewater treatment plants in the United States have capacities of less than 5 mgd. The manual emphasizes that operational improvement and modifications to existing unit operations be considered as the logical initial approach to upgrading existing treatment plants, before major expansion of existing facilities is implemented. Because of the numerous alternatives available for upgrading an existing treatment plant, it is necessary to understand thoroughly the fundamentals of the various unit operations commonly used in municipal wastewater treatment plants. Therefore, this manual examines in depth the capabilities, limitations, and interrelationships of the various unit processes. The manual also examines hypothetical situations requiring upgrading of unit operations and describes 'order of magnitude' costs associated with the upgrading of various unit operations. One chapter of the manual presents case histories of upgrading of existing wastewater treatment plants to illustrate the approaches actually used in these circumstances. The operation and maintenance requirements of the upgraded treatment plants are also briefly examined in the manual. (EPA)

RELIABILITY: A NEW PARAMETER IN URBAN WATER QUALITY MANAGEMENT,
Texas A and M Univ., College Station. Dept. of Industrial Engineering.
C. S. Shih, and J. K. Garner.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 801-830, (1972). 4 fig, 3 tab, 17 ref.

Descriptors: *Reliability, *Municipal water, River basins, Water quality control, *Optimization, *Management, Treatment facilities, Water pollution control, Environmental effects, Probability, Mathematical models, Systems analysis, Costs, *Regional analysis, Waste water treatment, *Texas, *Risks.
Identifiers: *San Antonio (Tex), Sensitivity analysis.

The endeavor to reduce the liability of pollution to urban water resources necessitates recognition of the probabilistic nature of the performance of pollution control facilities as well as environmental responses. There exists a great need to devise a methodology for the assessment of uncertainty of goal achievement and control parameters variation for river basin quality management. Reliability is defined herein as the measure of effectiveness for the attainment of water quality managerial goals. The concept of reliability of regional waste facilities is introduced. An optimization model is developed for the determination of the best pollution control policies for each treatment facility in terms of the minimization of total regional cost requirements, the quality control requirements, and the reliability desired. The variability of each treatment facility is characterized by a normally distributed random variable whereas the quality standard and reliability requirement is represented by a chance-constraint. Using the newly developed chance-constrained quadratic programming method coupled with parametric analysis, a solution approach for the model is devised. The effects of reliability on optimum managerial policies of urban water quality are illustrated by applying the developed model to the existing situation of San Antonio Area, Texas. Implications resulting from the sensitivity analysis of this model are also discussed. (See also W73-13134) (Bell-Cornell)

EFFECT OF WASTE WATER FROM THE ASTRAKHAN CELLULOSE-PASTEBOARD PLANT ON SOIL PROPERTIES,
V. S. Shumakov, and M. P. Popova.
Soviet Soil Science, Vol 4, No 5, p 577-587, 1972. 2 fig, 12 tab, 14 ref. Translated from Pochvovedeniye, No 10, p 99-109, 1972.

Descriptors: Waste water treatment, *Water reuse, *Industrial water, *Waste water disposal, *Irrigation effects, *Desalination, Irrigation, *Irrigation water, Irrigation ditches, Soil properties, Laboratory tests, Trees, Crop production, Soil types, Saline soils, Alkaline soils, Brown soils, Semiarid climates.
Identifiers: *USSR (Astrakhan), Poplar trees, Solonetzization.

Since waste water from cellulose-pasteboard plants cannot be discharged into natural bodies of water without preliminary treatment, the intermediate use of industrial waste water to irrigate various crops, as an additional resource, was studied. Field and simulated laboratory experiments were conducted using a mixture of industrial waste water from the Astrakhan Cellulose-Pasteboard Plant and domestic (Volga) water to irrigate poplar stands on Brown Desert-Steppe soils. During the first few years such use resulted in partial desalinization of the saline soils, but desalinization occurred more slowly than when the same soils were irrigated with Volga water. After irrigation with domestic-industrial waste water, desalinization of Brown Desert-Steppe soils of different textures resulted in a 33 to 92 percent increase in total alkalinity and a 5 to 16 percent increase in the degree of solonetzicity of the soils. The rate of solonetzization varied with soil texture, irrigation rate, and intake rate of irrigation water. Solonetzization in the surface layers of the irrigation furrows caused a sharp decrease in permeability. To improve the intake of irrigation water by poplars and to diminish the effects of solonetzization, temporary, rather than permanent, irrigation ditches or furrows should be used for a single growing season. SOLID WASTE DISPOSAL AND WATER PURIFICATION METHOD AND APPARATUS,
Combustion Power Co., Inc., Palo Alto, Calif. (Assignee).
R. D. Smith, and D. A. Furlong.
U. S. Patent No 3,741,890, 9 p, 9 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 911, No 4, p 1419, June 26, 1973.

Descriptors: *Patents, *Waste treatment, *Waste water treatment, Pollution abatement, Water quality control, Phosphates, Nitrogen, Lime, Suspended solids, Colloids, *Distillation, *Nutrient removal, *Domestic wastes, *Industrial wastes, Waste disposal.
Identifiers: Char, Combustion, Compression, Clarification, Sterilization, Pyrolysis.

The energy to operate this system is derived from the solid waste itself, the active char by-product of the pyrolysis of the waste being utilized to adsor contaminants from the waste water. Solid waste material is shredded and dried and then transferred to the pyrolyzer where waste is converted to hot fuel gas and char. The hot fuel gas is used to drive a gas turbine which generates all the power

ecessary to operate the system. Heat obtained
om exhaust of the turbine assembly is used in
ying the incoming waste material, and a com-
essor driving by the turbine supplies compressed
r to a char combustion chamber. A portion of the
ar is removed from the pyrolyzer and mixed
ith incoming waste water to remove contami-
nts therefrom by adsorption. After adsorption
the contaminants, a portion of the char is
moved from the water and recirculated back in
e pyrolyzer. Water partially decontaminated
rough adsorption by char, is clarified with lime
ken from ash generated in the combustion of the
ry same char. Lime clarification serves to
move from the water the supra-colloidal and col-
idal suspended solids, the colloidal size char par-
les and the phosphates. Calcium carbonate
ecipitated during clarification can then be
turned to the pyrolizer. Heat and power
nerated in the system can be used to distill and
erilize the partially treated waste water to make
otable. (Sinha-OEIS)

PERFORATED TUBE MODULE FOR LIQUID TREATMENT,
Neptune Microfloc, Inc., Corvallis, Oreg. (assignee)
A. K. Hsiung.
U.S. Patent No. 3, 741,401, 4 p, 7 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 911, No 4, 1303, June 26, 1973.

Descriptors: *Patents, Separation techniques, *Waste water treatment, Equipment, *Liquid wastes, Pollution abatement, Water quality control, Water pollution control.
Identifiers: Kinetic energy.

The apparatus comprises a set of inclined channels selected from perforated partitions or walls. The kinetic energy of an influent liquid is rapidly dissipated as the liquid flows through the perforations while the solids suspended in it settle out on the inclined bottoms of the channels. The liquid flowing through the device flows upward through the settling compartments as well as sequentially from the first to the last, while particles settle out and slide downward to the bottom into a sludge collecting and withdrawing device. (Sinha-OEIS)

WATER PURIFYING APPARATUS,
J. Muller.
U.S. Patent No. 3,741,396, 2 p, 5 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 911, No 4, p 1301, June 26, 1973.

Descriptors: *Patents, Filters, *Filtration, *Water purification, *Water quality control, *Waste water treatment.

The body of the apparatus has a main inlet port and a main discharge port, with corresponding secondary ports and control valves. A filter tank is mounted on the body. It contains a pair of hollow cylindrical filter elements, each having a wall defining a filter through which fluid may pass. The valves may be manually controlled to direct the untreated water either through the filter elements into the discharge ports or directly to the discharge port. (Sinha-OEIS)
W73-13326

LIQUID FILTERING APPARATUS,
L. F. Defenbaugh.
U.S. Patent No. 3,741,394, 3 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 911, No 4, p 1301, June 26, 1973.

Descriptors: *Patents, *Water purification, Filters, *Filtration, Activated carbon, Water quality control, Equipment, *Waste water treatment.

Apparatus comprises a housing which includes means for inserting the apparatus in the water line. It has removable cartridges containing suitable filtering materials such as activated carbon particles. A three-way diverter valve is operable to divert water flow through the filtering material or straight through the apparatus bypassing the filtering material. A metering valve is used to control the back pressure within the unit in order to maximize contact between the fluid and the filtering material. (Sinha-OEIS)
W73-13327

APPARATUS FOR THE PURIFICATION OF WASTE WATER,
Corodex (N.V.), Zandvoort (Netherlands). (assignee)
M. Adegeest.
U.S. Patent, No. 3,741,392, 4 p, 1 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 911, No 4, p 1300, June 26, 1973.

Descriptors: *Patents, *Chemical reactions, *Waste water treatment, Phenols, Resins, Pollution abatement, *Water purification, Water pollution control, Water quality control.
Identifiers: Formaldehyde.

The apparatus includes a mixing tank with lines to feed it with contaminated water, acid and phenol. The tank discharges to a heatable reservoir which has a gravity drain to a settling tank as well as an off-take for gaseous products and a bleed-off line from an intermediate zone for conveying fluids to an overflow tank. The overflow tank has a return line to the reservoir and a gravity drain for liquid resin. It is connected to an expansion boiler which is heated by fluid from heat exchange units. A stack removes vapor upward. A bleed-off line to an acid recovery vessel may be added. Air injectors are used as needed to maintain circulation. One or more phenols and an acidic reagent is added to the water to be purified. The phenol-formaldehyde molar ratio is important. The molar ratio in the waste water is generally 1:4.18 that is the percentage of formaldehyde is too high. By adding phenol the molar ratio is brought to 1:1.02 to 1:1.12. The formaldehyde will be bound by the phenol, as a result of which a thin, liquid resin mixture will be separated, while large resin molecules (i.e. -viscous resin) are avoided. (Sinha-OEIS)
W73-13328

TERTIARY FILTER,
Harsco Corp., Wormleysburg, Pa. (assignee)
G. L. Wallace, T. A. Ward, and P. R. Johnson.
U.S. Patent No. 3,741,390, 7 p, 12 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 911, No 4, p 1300, June 26, 1973. *Patents, *Tertiary treatment, *Waste water treatment, *Liquid wastes, *Filtration, *Pollution abatement, Water pollution control, Water quality control.

This teritary filter unit is intended for use in conjunction with a larger system of waste collection and treatment. This system has automatic control equipment associated with dual filter units allowing filtration through the first unit while filtered solid material is being removed from the second unit. It is adapted to sense a condition wherein one of the filters has become clogged and to automatically switch flow to the other unit while initiating a controlled backwash cycle. In the backwash cycle pressurized air is forced through the clogged filter media. This assures proper bed expansion and uniform agitation, prior to circulating wash water to flush solids out of the media. The contaminated backwash water may then be delivered to a previous stage of the sewage treatment system for further treatment prior to being returned to the teritary filter. (Sinha-OEIS)
W73-13329

METHOD FOR EFFICIENTLY SEPARATING SLURRY-STATE LIQUID INTO SOLID PART AND LIQUID PART AND AN APPARATUS THEREFOR,
Kanegafuchi Boseki Kabushiki Kaisha, Tokyo (Japan). (assignee)
K. Takahashi.
U.S. Patent No. 3,741,388, 10 p, 5 fig, 1 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 911, No 4, p 1299, June 26, 1973.

Descriptors: *Patents, *Waste water treatment, Slurries, *Filtration, *Liquid wastes, Pollution abatement, Water quality control, Water pollution control, *Waste treatment.

Slurry-state liquid waste is poured onto the surface of a liquid-permeable filter. The filter, made of foam, has good elastic recoverability from a compressed state. The liquid is absorbed in the foam whereas the mud-like solid part is retained on the surface of the filter. The filter is mounted on the circumference of a rotary drum. An endless belt serves to transfer the solids from the filter surface to the work surface of the belt. The solids carried on the endless belt are scraped off by a special scraper and allowed to drop into a collecting receptacle. A rotatable roll is placed in pressure

contact with the surface of the foam filter and squeezes out the entrapped liquid which is fed into a lead away vessel. (Sinha-OEIS)
W73-13330

PROCESS FOR TREATING SEPTIC BIOLOGICAL WASTES IN ARCTIC CLIMATES,
Texaco, Inc., New York. (assignee)
E. L. Cole, and H. V. Hess.
U.S. Patent No. 3,740,332, 3 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 911, No 3, p 1004, June 19, 1973.

Descriptors: *Patents, *Biological treatment, *Waste water treatment, *Oxidation, Biological oxygen demand, Chemical oxygen demand, Arctic, Pollution abatement, Water pollution control, Water quality control.
Identifiers: Septic biological wastes, Arctic environments.

A process provides a means of producing a clear effluent of low COD (BOD) which is sterile enough to be discharged into the Arctic environment and a part which may be burned or stored for removal from the Arctic. Wastes are passed into a primary settling zone. The temperature in the settling zone is held between 40 and 180F. The solids are moved to a coking zone and held at a temperature of 400 to 700F under a pressure of about 300 to 3500 p.s.i.g. for a period from 0.5 minutes to 2 hours. The coke is separated from the clear liquid. The cleared liquid (decoked) is mixed with effluent from the primary settler and the resulting mixture is air oxidized. Four examples are cited. (Sinha-OEIS)
W73-13332

PROCESS FOR THE REDUCTION OF THE BIOCHEMICAL OXYGEN DEMAND OF SEWAGE, AND FOR THE RECOVERY OF THE INHERENT PROTEIN,
Tatabanyai Szenbanyak (Hungary). (assignee)
J. Holo, J. Toch, and I. Zagyvai.
U.S. Patent No. 3,738,933, 2 p, 8 ref; Official Gazette of the United States Patent Office, Vol 911, No 2, p 627, June 12, 1973.

Descriptors: *Waste water treatment, *Patents, *Biochemical oxygen demand, *Sewage treatment, *Industrial wastes, *Dairy industry, *Fermentation, *Food processing industry, Slaughter, *Conservation, Pollution abatement, Water pollution control, Water quality control.
Identifiers: *Chemical treatment, Slaughter house wastes, Meat processing industry, Preserve factories.

A process is described for the purification of sewage, and, if required, for the recovery of the inherent protein from sewages. The biochemical oxygen demand of sewage of the type of meat, dairy and fermentation waste, is reduced by adding to the sewage at least 120 g/cu m of a water soluble aluminum salt or bivalent or trivalent iron salt, 0.5 to 1 kfi/cu m of bentonite or kaolin and 5 to 10 g/cu m of polymers or copolymers of acrylic acid-acrylic amide in the form of aqueous solution. The suspension is stirred and the pH adjusted to exceed 10 by addition of a basic calcium compound such as lime milk or calcium hydroxide. The precipitate thus obtained is separated by setting and transferred to a conical tank for treatment with carbon dioxide until the pH is no higher than 7, and the resulting precipitate is filtered and sterilized at a temperature above 130 degrees C, under pressure, to produce a biochemical culture medium or animal feed. (Sinha-OEIS)
W73-13334

METHOD FOR TREATING ACID WATER CONTAINING METALLIC VALUES,
Bethlehem Steel Corp., Pa. (assignee)
P.D. Kostenbader.
U.S. Pa8ent No. 3,738,932, 6 p, 1 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 911, No 2, p 627, June 12, 1973.

Descriptors: *Patents, *Aeration, *Sludge, *Metals, Alkalis (Bases), *Neutralization, *Acid mine water, Acidic water, *Waste water treatment, Pollution abatement, Water pollution control, Water quality control.

The method consists of treatment with an alkali-water slurry and recycled sludge mix, with or without the presence of air, to neutralize the acidity of the water and to precipitate a substantial portion of the metals. The slurry consists of at least one alkali taken from the gnt iron salt, 0.5 to 1 kfi./cu m ofroup consisting of high calcium lime, magnesia, dolomitic lime and sodium hydroxide. This slurry is mixed with a portion of the densified sludge and the product is mixed with the acid water in a second reactor to cause the mix and acid to react in the presence of air. The precipitate is then allowed to settle out to form a densified sludge and a clarified neutralized water. (Sinha-OEIS)

POTENTIAL FOR THE USE OF COBALT-60 IRRADIATION IN THE TREATMENT OF WASTE WATERS,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
D. A. Okun.
Available from NTIS, Springfield, Va., as TID-26341; $4.00 in paper copy, $1.45 in microfiche. Report No TID-26341, June 1973. 33 p, 47 ref.

Descriptors: *Cobalt radioisotopes, *Waste water treatment, *Sludge treatment, Water pollution, Water quality, Chemical degradation, Wastes, Organic wastes, Sludge, Disinfection, Water treatment, Settling basins, Economics, *Reviews, Waste disposal.
Identifiers: *Savannah River Plant, *Cobalt irradiation.

An evaluation of the potential for the use of cobalt-60 irradiation in the treatment of wastewaters is based primarily on a review of the literature in the field. Possible potential for cobalt-60 is in the degradation of organic pollutants and refractory chemicals in wastewaters, improvement in the settling characteristics of solids in wastewaters, improvement in the handling of wastewater sludges, and in the disinfection of wastewaters and sludges. Cobalt-60 irradiation is not very effective in the degradation of pollutants, except for certain specific industrial wastes, and has only a limited impact on the settling characteristics of wastewater solids. It is effective in disinfection of wastewaters. However, even where radiation is effective, the costs for treating wastewaters by irradiation are likely to be far too high to be competitive with other processes that are already available. Cobalt-60 irradiation may be economically feasible for sludge treatment because sludge is more concentrated than wastewater. However, the benefits in sludge handling are not likely to be attractive because alternative methods are more acceptable and economical. The greatest potential is for sludge disinfection, but sludge disinfection is not, nor is it expected to be, widely adopted. (Houser-ORNL)

W. S. Groenier.
Available from NTIS, Springfield, Va., as ORNL-TM-4209; $4.00 in paper copy, $1.45 in microfiche. Report ORNL-TM-4209, July 1973. 17 p, 6 fig, 13 ref.

Descriptors: *Waste water treatment, *Solvent extractions, *Laboratory tests, *Mercury, *Separation techniques, Pollution abatement, Brine, Toxins, Chemicals, Metals, Feasibility studies, Effluents, *Industrial wastes, Organic compounds, Environmental engineering, Costs, Systems analysis, Design, Immiscibility, Solubility, Solvents.

Tests are proposed to test flowsheet feasibility, develop operating criteria, and eventually test procedures on actual effluents. Entrainment is minimized by internal recycle in each stage. Hg removal from chloralkali plant effluents (see W73-11107) would be the object of initial studies. The loaded organic phase (0.1 M tricaprylamine in an inert dilutent such as xylene) is stripped by a 2.5% ethylenediamine or propylenediamine solution. The extracted brine is recycled to eliminate a large fraction of the total effluent volume. For testing this process a laboratory-scale 4-stage mixer-settler was designed. The estimated fabrication cost is $1000 per stage, including pump purchase and overhead. The residence time required for intimate mixing and subsequent coalescence is about 15 seconds per stage. Choice of an industrial-scale solvent extraction contactor is considered briefly. (Bopp-ORNL)
W73-13422

HEAT RECOVERY IN PROCESS PLANTS,
Struthers Wells Corp., Warren, Pa.
J. P. Fanaritis, and H. J. Streich.
Chemical Engineering, Vol 80, No 12, p 80-88, May 28, 1973. 6 fig, 4 tab.

Descriptors: *Thermal pollution, *Heat exchangers, *Design, *Economic efficiency, Heat transfer, Steam, Steam turbines, Heat treatment, Cooling, Fuels, Costs, Economics, Evaluation, Planning, Power system operations, Industrial plants, Boiler feed water, Pre-treatment (Water).
Identifiers: *Heat recovery systems.

Heat recovery systems can be used to generate steam, to pre-heat boiler feed water, to pre-heat combustion air, for steam superheating, to pre-heat process streams and for circulating heating systems. The primary equipment for heat recovery is broadly classified as either fire-tube or water-tube type depending on whether the elevated-temperature stream is flowing on the inside or the outside of the tubes. The broad range of heat recovery system applications makes it difficult to provide specific guidelines for economic evaluations. The following general guidelines are widely applicable: economic value of the recovered heat should exceed the value of the energy required to produce its equivalent; an economic evaluation of a heat recovery system must be based on a projection of fuel cost over the life of the equipment; environmental restriction must be considered; many elevated-temperature streams require cooling over

a long temperature range; and fuel availability might affect the ability of a plant to maintain operations. (Jerome-Vanderbilt)
W73-13431

ESTIMATING COOLING TOWER COSTS FROM OPERATING DATA,
A. Zanker.
Chemical Engineering, Vol 79, No 13, p 118-119, June 12, 1972. 1 fig, 1 tab, 2 ref.

Descriptors: *Cooling towers, *Cost analysis, *Design criteria, Water cooling, Temperature, Heated water, Heat transfer, Atmosphere, Data collection, Operation and maintenance, Evaluation, Mathematical studies.

Cooling tower costs are estimated using four primary variables; the total heat load, the temperature of the water leaving the tower, the wet bulb temperature of the local atmosphere, and the temperature of the heated water entering the tower. Quick calculations have been developed which relate these factors to the published data on equipment and installation costs. The equation is presented and an example is given. A table presents a comparison of estimated and real cooling tower costs listing various characteristics. (Jerome - Vanderbilt)

TREATMENT OF RADIOACTIVE STEAM-GENERATOR BLOWDOWN,
NUS Corp., Pittsburgh, Pa. Cyrus Wm. Rice Div.
W. R. Greenaway, W. J. Klein, J. Markind, and R. R. Stana.
Industrial Water Engineering, p. 22-24, March/April 1973, 2 fig, 3 tab.

Descriptors: *Nuclear powerplants, *Radioactive wastes, *Waste water treatment, *On-site tests, Electric power production, Water pollution, Radioisotopes, Iodine radioisotopes, Phosphates, Boron, Ion exchange, Separation techniques, Laboratory tests, Boilers, Distillation, Reverse osmosis, Evaluation, Costs, Operation.
Identifiers: *Blowdown.

To minimize waste water handling problems, methods of handling contaminated steam generator blowdown were investigated. An ion exchange system design was attempted for radionuclides using a phosphate solution containing boric acid. The potentially contaminated wastes generated by the ion exchange would be 12 gpm when operating to purify a blowdown rate of 45 gpm, exceeding the capacity of the radwaste system by three-fold. Flash distillation, shell and tube distillation and reverse osmosis were considered as alternate approaches. The two distillation processes were rejected on the basis of equipment size and cost. A one-module reverse osmosis system was set up to test the effectiveness in removing phosphate, boron, and radioactive elements. A recovery of at least 90% was possible. At feed pH of 9.2-9.4, a membrane life of 2 years could be expected. Boron removal was about 65%. Six hundred operating hours with no change in performance have been logged in on-site testing, reducing radioactivity by a factor of 100 or more. No problems with iodines and cesium were anticipated as long as the water was recycled. No appreciable savings could be made by using the unit under no-leakage conditions. (Jerome-Vanderbilt)

RY COOLING TOWER USES STEEL STRUCURE,
Hoterv, Budapest (Hungary).
I. Bodas.
Electrical World, Vol 177, No 7, p. 30-34, April 1, 1972. 4 fig.

Descriptors: *Cooling, *Cooling towers, *Heat transfer, *Structural design, Heated water, Structural stability, Structural engineering, Thermal powerplants, Thermal pollution, Structural shapes.
Identifiers: *Air cooling, *Dry cooling towers, Soviet Union, Hungary.

Natural-draft dry cooling towers are now being operated successfully in the Soviet Union rated for 200 Mw at nearly 6,000 ft. of elevation. An aluminum-covered steel structure, required because of high seismic loading, is believed to offer significant economic advantages even for more normal applications, and is believed to open the way to single-tower designs for plants rated up to 1,200 Mw. The plant uses the Heller cooling system adopted after the British, German and Hungarian experience. Design and operating details of the water flow, controlling the heat dissipation, protecting the cooling elements, stiffening the cylindrical section, and construction of the tower skirt, the air coolers and the condensers are discussed in depth. Identifiers: *Photofinishing wastes, *Ferricyanide, Chemical recovery, *Cyanides.

Complex cyanides (ferro-and ferricyanide) in industrial waste water effluents impose a direct threat upon the environment. Methods to recover or destroy these compounds were evaluated in laboratory studies. The techniques tested include electrolysis, ozonation, chlorination and heavy metal ion precipitation. The study was conducted to determine the feasibility of using one or more of these methods to reduce the concentration of ferricyanide in both concentrated (10,000 to 100,000 mg/l) and dilute (10 to 100 mg/1) waste effluents. Numerous analytical procedures were developed to enhance the accuracy of sample analysis over the concentration range studied. Ferrocyanide can be oxidized to ferricyanide in overflow photographic color process bleaches using either electrolysis or ozone and the waste bleach recirculated for reuse in the process. Dilute concentrations of ferricyanide can be destroyed using ozone or chlorine under proper conditions of temperature, pH and catalyst addition. (EPA)

Identifiers: Aliphatic diamine, Trialkyl benzylammonium chloride.

Biological growth in industrial water systems results in inefficient operation and eventual malfunctioning. Organisms can enter the system and thrive in environs which would appear to be intolerable. Slime formation is the major problem because its glue-like nature allows it to adhere to virtually any surface and to cause fouling. Chlorine, polychlorophenate biocides and organic sulfur compounds have been used as controls in the past, but were either too corrosive, ecologically harmful, or ineffective at various pH levels. The present requirements for microbicides are biodegradability; a wide range of effectiveness; oxidation resistance; compatability at use levels with corrosion inhibitors; effectiveness at higher system water pH levels and penetrating and dispersing abilities against slime formations. The organic amine-type biocides currently available exhibit abilities in all these categories. Aliphatic diamine and trialkyl benzylammonium chloride are two significant amine types. Two case histories are presented to demonstrate the effectiveness of microbiological growth control programs designed in accordance with the parameters outlined. (Jerome - Vanderbilt)

SOLUTE SEPARATION BY CONTINUOUS BUBBLE FRACTIONATION,
Rutgers - The State Univ., New Brunswick, N.J.
B. T. Kown, and L. K. Wang.
Separation Science, Vol 6, No 4, p 537-552, August 1971. 10 fig.

Descriptors: Waste treatment, *Waste water treatment, Surfactants, *Solutes, Bubbles, Adsorption, *Separation techniques.
Identifiers: Pollutant separation, *Bubble fractionation.

A continuous bubble fractionation system consisting of a vertical Plexiglas tube provided with a source of air bubbles, means of continuous liquid feed, overflow, and bottom effluent has been operated to study the performance of the system. The study primarily involves an examination of the effects of variables such as gas rate, liquid rate, solute concentration, and column size on the effectiveness of the system for separating an organic solute from a dilute aqueous solution. The experimental results indicate that the effects of gas and liquid rate on the performance have generally followed the results expected from an equilibrium adsorption of a surfactant on the gas-liquid interface described by Gibbs' equation and material balances. An increase in gas rate increased the effectiveness of the system by providing more adsorption surface. The adverse transfer of the solute by the eddy diffusion caused by rising bubbles was found to be the factor limiting the effectiveness of the system.

CONTINUOUS BUBBLE FRACTIONATION: PART I, THEORETICAL CONSIDERATION,
Calspan Corp., Buffalo, N.Y.
L. K. Wang, M. L. Granstrom, and B. T. Kown.
Environmental Letters, Vol 3, No 4, p 251-265, 1972.

Descriptors: *Waste water treatment, Water quality control, Evaluation, Bubbles, Solutes, Surfactants, *Adsorption, *Separation techniques.
Identifiers: Pollutant separation, *Bubble fractionation.

The bubble fractionation process is one of a number of adsorptive bubble separation methods which involves the use of selective adsorption of

surface-active solutes at the gas-liquid interfaces of the rising bubbles in a bubble column. It can be used as an advanced treatment method for certain industrial effluents or domestic sewage which contain surface-active substances. In this study, a theory for continuous operation of the bubble fractionation process was developed. The theory involves: (a) the adsorption of surface-active solutes at rising bubble surfaces; and (b) balancing flow in the bubble column against axial diffusion and the departure of solutes from the fractionation system. Theoretical analyses imply that the effectiveness of the continuous bubble fractionation system increases with increasing gas rate and the surface activity of the solute but decreases with increasing column cross-sectional area, axial diffusion and bubble size.

CONTINUOUS BUBBLE FRACTIONATION: PART II, EFFECTS OF BUBBLE SIZE AND GAS RATE,
Calspan Corp., Buffalo, N.Y.
L. K. Wang, M. L. Granstrom, E. L. Bourodimos, and B. T. Kown.
Environmental Letters, Vol 4, No 3, p 233-252, 1973.

Descriptors: *Waste water treatment, Water quality control, Evaluation, Bubbles, Solutes, Surfactants, Adsorption, *Separation techniques.
Identifiers: Pollutant separation, *Gas rate, *Bubble size, *Bubble fractionation.

Theoretical equations developed for continuous bubble fractionation process have been evaluated experimentally using bubble size and gas flow rate as variables. Variations of bubble size and gas flow rate, which will affect the column performance of either batch or continuous bubble fractionation system, are predicted by the developed theory. Based on theoretical development and experimental verifications, several approaches for the improvement of the bubble fractionation system are suggested.

CONTINUOUS BUBBLE FRACTIONATION: PART III, EXPERIMENTAL EVALUATION OF FLOW PARAMETERS,
Calspan Corp., Buffalo, N.Y.
K. Wang, M. L. Granstrom, E. L. Bourodimos, and B. T. Kown.
Environmental Letters, Vol 5, No 2, p 71-89, 1973.

Descriptors: *Waste water treatment, Water quality control, Evaluation, Bubbles, Solutes, Surfactants, Adsorption, *Separation techniques.
Identifiers: *Liquid flow rates, Gas rate, Pollutant separation, *Bubble fractionation.

The performance of a bubble fractionation process was investigated experimentally using liquid flow rate and gas flow rate as variables. Based on an ideal model, the theoretical performance of the continuous bubble fractionation process was qualitatively evaluated.Experimental results indicate that an increase in the bottom effluent rate while keeping the overflow rate constant increases the solute concentration in the top overflow. An increase in overflow rate while keeping the bottom effluent rate constant decreases the solute concentrations of top overflow, but decreases insignificantly the bottom effluent's solute concentration. When the feed rate is constant, optimization of the bubble fractionation system can be achieved by regulating the top-to-bottom flow rate ratio. For practical engineering application, a meaningful combination of physical dimensional parameters into dimensionless operational charts can be useful for plant operators in operating the continuous bubble fractionation process.

EVALUATION AND DEVELOPMENT OF PHYSICAL-CHEMICAL TECHNIQUES FOR THE SEPARATION OF EMULSIFIED OIL FROM WATER,
Calspan Corp., Buffalo, N.Y.
K. Wang, Y. Yang, and B. Dahm.
Technical Report, Calspan Report No. 189, 31 p, 7 tab, 40 ref, May 1973.

Descriptors: *Waste water treatment, Evaluation, Flotation, Magnetization, Coalescence, Chromatography, *Filtration, Reverse Osmosis, *Absorption, Coagulation, *Polyelectrolytes, Sedimentation, Oil, Physicochemical properties, *Separation techniques, Emulsions, Oil-water interfaces, Reveiws.
Identifiers: Oil Pollution Control, *Carbon adsorption.

Various methods for separating emulsified oil from water were surveyed and investigated. A state-of-the-art review of physical-chemical processes for oil-water separation included conventional coalescence, chromatography, layer filtration, reverse osmosis, absorption filtration, hydrocyclone, centrifugation, settling, chemical coagulation, evaporation/distillation, freezing, biological oxidation, clarification, flotation, and solvent extraction. A search for some universally applicable methods for the separation of emulsified oil from water was made. Promising physiocochemical processes for oil-water separation include: (1) granular carbon adsorption; (2) powdered carbon adsorption followed by polyelectrolyte coagulation and final polishing; and (3) powdered carbon adsorption followed by direct filtration. Greater than 99% oil removal can be achieved with these processes.
W73-13642

EFFECT OF CALCIUM LIGNOSULFONATE ON PROPERTIES OF CONCRETE AT EARLY AGES,
Missouri Univ., Rolla.
L. K. Wang.
M. S. Thesis, 1965. 63 p, 7 tab, 23 fig, 11 ref.

Descriptors: Lignins, Sulfonates, Sulfite liquors, Pulp wastes, Concretes, Cements, *Recycling, *Water reuse, Concrete mixes, Compressive strength, Tensile strength, *Concrete additives.
Identifiers: Calcium lignosulfonate, Concrete beam, Concrete cylinder, *Lignosulfonates.

Lignosulfonate (or lignin sulphonate) is a plant constitutent which is often discharged as waste during the manufacture of paper by the sulfite pulp process. This giant polymer waste constituent is difficult to remove by biological treatment techniques. A new tendency of paper and pulping waste treatment is the recovery of lignin from the wastewater for reuse. In this program, the feasibility of using the recovered lignosulfonate as a concrete admixture was investigated. Lignosulfonate was tested for its effect on the tensile and compressive strength of plain concrete cylinders, and for its effect on the flexural strength of plain concrete beams. The effect of the admixture on shrinkage, slump, air content and unit weight was also studied. The test results showed that lignosulfonate reduces the amount of water required to make a workable concrete mix; a more workable mix saves money because it is easier to place, thus reducing labor requirements for the project. Reducing the water content while leaving the cement factor unchanged results in concrete of higher tensile, compressive and flexural strengths at all ages.
W73-13644

EFFECT OF PH ADJUSTMENT UPON ACTIVATED CARBON ADSORPTION OF DISSOLVED ORGANICS FROM INDUSTRIAL EFFLUENTS,
Calspan Corp., Buffalo, N.Y.
L. K. Wang, R. P. Leonard, D. W. Goupil, and M. H. Wang.
Preprint presented at the 27th Annual Purdue Industrial Waste Conference, Purdue University Lafayette, Indiana, May 1972: 22 p, 5 tab, 17 ref.

Descriptors: *Hydrogen ion concentration, *Activated carbon, *Waste water treatment, Polymers, Hydrolysis, *Adsorption, Pulp Wastes, Lignins, *Industrial wastes, Solutes.
Identifiers: Adsorption capacity, Adsorption rate, *Dissolved organics, Glue factory wastes.

The influence of the initial hydrogen ion concentration on carbon adsorption of organic solutes was reviewed and studied experimentally. The adsorption mechanisms describe carbon adsorption of single organic compounds from aqueous solutions. Since industrial effluents generally include multicomponent organic solutes, the optimum pH for activated carbon treatment of specific industrial effluent must be determined experimentally because many competing adsorption mechanisms are involved.

TREATMENT OF GLUE FACTORY WASTE BY PHYSIOCOCHEMICAL PROCESSES,
Calspan Corp., Buffalo, N.Y.
Lawrence K. Wang, Richard P. Leonard, and Dennis W. Goupil.
Project Report VT-3045-M-3, 79 p, 9 fig, 12 tab, 7 ref., January 1972.

Descriptors: *Waste water treatment, Recycling, Water reclamation, *Activated carbon, Adsorption, *Coagulation, *Filtration, *Chlorination, Cost analysis, Physicochemical properties.
Identifiers: Tannin, *Glue factory wastes, Carbon adsorption.

In an animal glue plant, the two waste streams of greatest concern are the alkaline waste containing lime, protein, blood, and dirt from the lime curing and washing operations, and the acid waste containing sulfuric acid, chromium sulfate, dissolved organics, and hydrochloric acid from the acid treatment, washing, and neutralization operations. There has been little success in developing adequate and economical methods for the abatement of glue factory pollutant discharges. The treatment procedures investigated were equalization, sedimentation, carbon adsorption, coagulation, sand filtration and chlorination. Two conceptual physicochemical waste-treatment systems are proposed in what is believed to be an optimum combination of appropriate unit processes. Experimental results indicate that high reductions of chemical oxygen demand, dissolved protein, tannin, suspended solids, chromium, turbidity, and color could be achieved by the proposed waste treatment systems. The purified effluent could be recycled for in-plant use in glue factory operations.

SURFACE ADSORPTION: A PROMISING APPROACH FOR THE TREATMENT OF TANNERY EFFLUENTS,
Calspan Corp., Buffalo, N.Y.
L. K. Wang.
Project report VT-3045-M-Z, 60 p, 11 fig, 11 tab, 43 ref, Oct. 1971.

Descriptors: *Waste water treatment, *Adsorption, Physicochemical properties, Carbon, *Flotation, Foam separation, Surfactants, *Tannery wastes, Industrial wastes, *Water reuse.
Identifiers: *Surface adsorption, *Combined treatment.

Three candidate physicochemical processing techniques for removing pollutants from tannery effluent are described which allow a greater bulk of the wastewater to be reclaimed as a useful

ater resource. Organic substances, and Cr, under rtain circumstances, can also be recovered as eful by-products. The techniques are specific rface adsorption processes: foam separation thout additives, adsorbing colloid flotation, and sorption flotation. Foam separation without ad- ives is not feasible for the removal of either dis- lved organics or suspended solids from tannery astes. Adsorbing colloid flotation is feasible for e primary treatment of tannery wastes, provided at dimethyldihydrogenated-tallow ammonium loride or the like is used as a collector. Adsorp- n flotation, combining carbon adsorption and tation into a single process, can achieve a high ctional removal of both dissolved and spended pollutants. Utilizing carbon adsorption d flotation in series would have the same effi- ncy as that of adsorption flotation. Other aux- ry physicochemical unit processes, such as limentation, sand filtration, lime precipitation, d centrifugation, are also investigated.

E. Ultimate Disposal of Wastes

ASIBILITY OF USING PULP MILL SLUDGE AN ADDITIVE TO CORRUGATING MEDI- I,
shington Univ., Seattle. Coll. of Forest sources.
H Hsv.
y 1972, 31 p. 12 fig, 4 tab, 10 ref, append. VRR-A-043-Wash (2).

scriptors: Pulp and Paper Industry, *Pulp stes, Waste disposal, *Sludge disposal, Indus- l wastes, Effluents, Water reuse, *Recycling.
ntifiers: *Pulp mill sludge.

is research was concerned with a method to pose of the ever accumulating sludge which nes from the clarifiers when the solids are noved from the effluent waters of a pulp mill. e objective was to determine if sludge could be d as an extender in corrugating medium. The in idea was to utilize the sludge rather than ply dispose of it. Sludge from three different e mills was added in quantities of 10, 20 and 40 cent to a commercial corrugating medium nish. Handsheets made by an improved labora- y method were tested for flat crush strength. e addition of sludge to the commercial furnish uced the flat cursh strength. The reduction is ieved accounted for at least in part by the ex- sive chemical fiber content of the experiment nish. Therefore, further tests, varying the fiber t, are needed before the idea of using sludge in rugating medium can be discarded. The chanism of flute failure during the flat crush was investigated. Pressing the medium at 130 after drying gave maximum flat crush strength. eater pressures decreased strength due to uced caliper which more than offset any ther improvement due to increased density of sheet.

EFFECTS OF A POLYELECTROLYTE AS A FILTER AID,
Detroit Dept. of Water Supply, Mich.
M. A. Garnell.
Journal of the American Water Works Association, Vol 55, No 5, p 597-601, May 1963. 2 ref.

Descriptors: *Water treatment, *Electrolytes, *Filtration, Water quality, Turbidity, Mixing, Flocculation, Head loss, *Polyelectrolytes, *Filters.
Identifiers: Filter aid.

The safety and palatability of water increases with the degree of clarity. The danger of passage of viruses into drinking water is reduced when a high degree of turbidity removal is achieved. In addition, the recently developed chemicals, pesticides, and fertilizers in increasing variety and quantity are finding their way into water sources; some of these materials are obnoxious and even dangerous to public health. Therefore, filters should be maximum efficiency. At one Detroit water treatment plant, which has a mixing chamber with a retention time of about 5 minutes, slugs of industrial wastes sometimes caused poorer filtered water quality for several hours. The same raw water conditions often go unnoticed at two other plants where long periods of flocculation are provided. A polyacrylamide with a molecular weight of approximately 1,000,000, which is slightly anionic (Separan NP 100) was tested as a filter aid. At continuous dosage of 20 ppb the effluent turbidity is reduced from 0.5 to less than 0.1 unit in about 2 hours. If dosing is discontinued, turbidity again increases in about 2 hours. At less than 10 ppb dosage, the minimum turbidity remained about 0.1 unit. Application of the electrolyte directly to the filters increases the rate of head loss in proportion to the dosage rate. At 10 ppb the rate of increase in head loss was 30-40% higher and at 30 ppb approximately 100% higher. (Bean-AWWARF)

OPTIMUM ECONOMICAL DESIGN FOR MUNICIPAL DIATOMITE FILTER PLANTS,
Iowa State Univ., Ames.
E. R. Baumann, and R. L. LaFrenz.
Journal of the American Water Works Association, Vol 55, No 1, p 48-58, January 1963. 6 fig, 5 tab, 5 ref.

Descriptors: *Water treatment, *Filters, *Design, *Diatomaceous earth, *Flow rates, *Economics, *Automation, Head loss.
Identifiers: *Diatomite filters, Filter aids, Coagulant aids.

The design of a diatomite filtration plant should be based on an optimum combination of filtration rate, filter cake terminal-head loss, and rate of body feed which will produce potable water at a minimum cost. The cost is a function of labor, power, diatomite, and equipment. A method of finding the optimum is demonstrated. Conclusions are (1) With manual operation, short filter runs are not economical, (2) Of three filtration rates tested, a rate of 1 gpm sq. ft. was optimum, (3) Optimum body feed was relatively low; with 7-8 ppm iron in the water the optimum was 40 ppm diatomite, (4) Terminal head losses between 50 and 100 ft. of water were optimum at low body feed rates, since long runs were necessary for the labor economy, (5) At high body feed rates power becomes the dominating factor and lower terminal head loss produced the minimum cost, (6) Automation reduced the terminal-head loss for minimum cost, (7) Automatic operation resulted in largest production cost saving for the smallest city, however maintenance could be a problem if qualified personnel were not readily available, (8) Lower iron concentrations were cheaper to filter, (9) Production costs were less for a large city than for a small city, and (10) Production costs could be 400-500% higher than necessary if other than optimum conditions of flow rate, terminal-head loss, and body feed were used. WATER TREATMENT FOR HEATING AND PROCESS STEAM BOILERS,
K. W. Herman, and L. R. Gelosa.
Power Engineering, Vol 75, No 4, p 54-57, April 1973. 3 fig, 1 tab.

Descriptors: *Boiler feed water, *Water treatment, *Corrosion control, Water quality control, Water quality, Boilers, Deaeration, Filtration, Water softening, Demineralization, Scaling, Oxidation, Heating, Heated water.

Boiler feed water treatment programs for the purposes of preventing deposit formation, control of corrosion and prevention of boiler water carryover are discussed. Consideration of the whole system must be made when choosing a treatment program. The treatments considered are filtration, sodium zeolite softening, hot lime softening followed by filters and sodium zeolite softening, cold lime clarification and partial softening followed by filters and sodium zeolite softeners, and demineralization. Sludge conditioners containing polymers, organics, sequesterants, iron sequesterant-dispersant, and antifoam prevent deposits while acting as an on-stream cleaner.

Chelates, if carefully used, will prevent scaling and baked on sludge. Water carryover which reduces steam quality and leads to after boiler deposits, plugged values and traps, and turbine damage, can be prevented by steam separation device maintenance and use of antifoam agents. Corrosion due to oxidation can be reduced by deaeration of the feedwater. Adjustment of pH is another method of preventing corrosion. (Jerome - Vanderbilt)

MAGNETIC TREATMENT OF WATER.
Informatics, Inc., Rockville, Md.

Available from NTIS, Springfield, Va 22151 as AD-757 887 Price $3.00 printed copy; $1.45 microfiche. Report, January 30, 1973. 2 fig, 6 ref. ARPA Contract No F44620-72-C-0053.

Descriptors: *Water treatment, *Scaling, *Boilers, *Reviews, *Magnetic studies, Water softening, Water chemistry.
Identifiers: *Magnetic treatment (Water).

A magnetic field of some 100 to 1000 oersteds is effective in preventing the formation of scales or incrustations in boilers and heating systems. After magnetic treatment, natural water does not, when heated, produce a hard scale on the walls of the boiler or in heating pipes, but rather a loose sludge which settles to the bottom and can easily be removed or flushed without acid treatment. A large number of papers pertinent to magnetization and to such questions as how a magnetic field acts on water, for what purposes magnetic treatment is effective, and under what conditions it is most effective and efficient, have been published in the Soviet Union over the last 20 years. In some cases the conclusions drawn by various authors, based on laboratory experiments, have been completely contradictory. The only fact which is generally agreed upon seems to be that a magnetic field reduces the kinetics of crystallization processes and the freedom of movement of charged particles. (Knapp-USGS)

ELECTROPHORETIC EVALUATION AND PROCESS CONTROL,
Philadelphia Water Dept., Pa.
E. L. Bean, S. J. Campbell, and F. R. Anspach.
Water Works and Wastes Engineering, Vol 2, No 11, p 47-51, Nov. 1965. 5 fig, 1 tab, 5 ref.

Descriptors: *Water treatment, Sanitary engineering, *Water quality, *Zeta potential, Electrophoresis, *Colloids, Oxidation, Hydrogenion concentration, Activated carbon, Kalonite, Color, Turbidity, Taste, Odor.
Identifiers: *Process control.

Studies and plant experience have demonstrated that: odor-producing materials do not associate to any major extent with hydrophobic colloids; High negative zeta potential indicates the colloids are hydrophilic, normally indicating wastes or sewage pollution; ZP is a dominant factor in coagulation control; ZP control of coagulation processes can produce savings; ZP and pH zones, once established, for any type of treatment, may thereafter be utilized for control. Present information indicates that: color removal with alum coagulant requires neutral to slightly positive ZP; Color removal with ferric coagulant is best with slightly positive ZP; Turbidity removal requires negative ZP, the magnitude required varying greatly in the presence of different clays; Removal of hydrophilic colloids will reduce odors in plant effluents. Presently no method of effecting direct removal of dissolved organics has been developed, other than adsorption by activated carbon, possibly calcined kaolin or chemical oxidants. (Bean-AWWARF)

FLOATING AERATOR,
Yeomans Brothers Co., Melrose Park, Ill.
J. A. Roeber, R. J. Nogaj, E. J. Ciabattari, and E. Hurwitz.
Water Works and Wastes Engineering, Vol 2, No 12, p 64-66, Dec. 1965. 4 ref.

Descriptors: *Water treatment, *Water quality, *Aeration, Dissolved oxygen, Efficiencies, *Design.

It has been demonstrated that artificial aeration of an oxygen-deficient stream, using a floating aerator system, is a feasible method for raising the dissolved oxygen content. Tests at three sites showed that dissolved oxygen concentration of the river could be increased with energy efficiencies varying from 0.82 to 2.7 lb of oxygen per hp-hr. Efficiency decreased as the concentration of DO increased. Maximum efficiencies are obtained when the units are placed at points of low DO and high velocity of flow, with the aerators placed across the stream, not one downstream from the other. For equal oxygen transfer, many small aerators will require less power than a few large aerators. However, other costs normally decrease with increasing unit size. The sizing of aerator units should be established after investigating the stream under consideration. The oxygen transfer efficiencies reported were somewhat less than those normally obtained in an activated sludge plant. However, river aeration requires no cost for tankage. A new aerator blade was developed which produced higher efficiencies than those previously manufactured. (Bean-AWWARF)

TREATMENT OF ACID MINE WATERS,
Rohn and Haas Co., Philadelphia, Pa.
F. Pollio, and R. Kunin.
Water and Wastes Engineering, Vol 4, No 8, p 64-66, Aug. 1967. 2 fig, 4 tab.

Descriptors: *Water treatment, Water quality, Water softening, *Mine water, Hardness (Water), Lime, *Anion exchange, *Resins, Aeration, Coagulation, Sedimentation, *Electrolytes.
Identifiers: Amberlite IRA-68.

A basic process has been developed whereby a 3,000 ppm acid mine drainage water may be processed to yield water suitable for industrial, agricultural and domestic purposes. The process is based on use of the conventional gel anion exchange resin, Amberlite IRA -68, which, used in a column operation, functions in the bicarbonate cycle. The effluent water is aerated and clarified to give useful water, whose quality may be further improved through lime softening. In the clarification step, improved clarification and sedimentation rates may be obtained using an anionic polyelectrolyte. Because some precipitation may occur during alkalization, it has been necessary to operate in an unconventional upflow manner during the ion exchange step. No noticeable pressure drop nor deposition of precipitates into the resin exchange capacity has been achieved. The process possesses much flexibility, and a water of practically any desired quality may be obtained, something that direct lime neutralization methods have not achieved. (Bean-AWWARF)

A LITTLE PHENOL STIRS UP A LOT OF PUBLIC RELATIONS,
Wilmington Water Cept., Del.
M. S. Shane.
Water Works Engineering, Vol 115, No 5, p 340-342, May 1962.

Descriptors: *Water treatment, *Public health, *Taste, *Odor, Chlorination, *Activated carbon, Monitoring, Water pollution, *Phenols, *Delaware.
Identifiers: Wilmington (Del).

Wilmington water department has been plagued a times with phenol type pollution in concentration of 10 to 25 ppb in the Brandywine creek, particu larly in December and January. The pollution is o a batch nature. Because of its intermittency it i hard to locate the source, particularly across stat lines. The two state agencies must work together A different source has been responsible each time It is detected at the plant which is approximatel 24 hours away from the points of pollution. Odo tests are run every hour, after chlorination t produce the chloro-phenol if present. Activate carbon is applied continuously but if a lag in in creased dosage occurs when the phenols ar received there is a clamor of telephone calls. Mos of such problems occur late at night or in earl morning when laboratory personnel are not im mediately available. Taste tests are used after fi tering the raw water through a membrane filter an chlorinating it. Sometimes the phenol is detecte by this method when it was not detected by odo In the past five years threshold taste above 1 ha been present 2 1/2 days per year, or less than 1 pe cent of the time. ON BACTERIAL AFTERGROWTH IN DRINK ING AND INDUSTRIAL WATER: I. THE IN FLUENCE OF ION-EXCHANGE PLANTS (I GERMAN),
Hygiene-Institut, Frankfurt am Main (West Ge many). Abteilung Hygiene.
R. H. W. Schubert.
Zentralbl Bakteriol Parasitnekd Infektionskr Hy Erste Abt Orig Reihe B Hyg Praev Med, Vol 15 No 5/6, p 488-501, 1972, Illus, English summary.
Identifiers: Alcaligenes, Bacteria, *Bacterial afte growth, Disinfection, Ions, Pseudomonas sp *Potable water, *Industrial water, *Ion exchange

Comparative examinations carried out on io exchanger plants showed that the mode of their a tion is essential to the degree of bacterial afte growth developing in the water on its passag through the exchanger bed. Intermittent operatio of the exchanger including prolonged hold-u periods of the water in the exchanger bed w promote bacterial growth. When the water is bei used continuously, or when certain amounts of are employed or decanted automatically eve hour, bacterial growth does not occur or is ke within limits. The numbers of bacteria show no a ditional increase in the course of its passag through the ion exchanger. Model experimen showed that the exchanger functions mainly as large surface. Studies on the organisms respon ble for bacterial aftergrowth showed that certa Pseudomonas species present at lesser or high numbers in the tap water preferentially propaga in the exchanger bed since the relative numbers other Pseudomonas species occurring in tap wat show a decline. The gram-positive bacteria mo or less commonly found in tap water usual propagate at a lower rate than the Pseudomon species do. In one of the plants examined, distinct increase was noted in the content of ba teria belonging to the Alcaligenes group. The fo lowing conclusions were drawn: the flow throu the ion-exchanger plant should be kept as contin ous as possible, regular disinfection, e.g., simu taneously with regeneration, will be successf only when the period of contact with the disinfe tant of the exchanger is kept as long as possib With the currently used methods of exchang regeneration, the period of contact is not suf cient.--Copyright 1973, Biological Abstracts, Inc

er management strategies in arid urbanizing
ons require careful evaluation of alternatives
supplying future demands and controlling
r quality. Mathematical models were
loped which describe the interrelationships
ng various institutional factors in order to
neate the requirements for implementing op-
l policies. The first of two study areas selected
est the utility of the models is Denver,
orado. This area is an excellent example of an
where the conditions of water scarcity and in-
singly stringent water quality standards are
cal. The Utah Lake drainage area in central
n is the second region considered. In this re-
, water quality management is necessary to in-
the continued use of water in the downstream
ulation center of the state. Together these
els produce results useful in determining the
mal strategies for water management in arid
nizing areas. A generalized summary is
ented to integrate these findings into a West-
e evaluation of this problem.

ogram was conducted to evaluate the feasibili-
f methods for plugging leaks in damaged
nical containers by application of suitable
ic barriers. Such a system would be valuable
elping to prevent water pollution from spilled hazardous chemicals. A large number of candidate sealants were evaluated in laboratory screening tests, including various urethane foams; polystyrene and polyvinyl acetate instant foams; filled and unfilled epoxy systems; and polysulfide, butyl, neoprene, and silicone rubber systems. The most promising results were obtained with the urethane foams. Additional evaluation and scaleup tests were made, including sealing of leaks of many different hazardous chemicals, application to leaks both under water and in air, and sealing of leaks in 55-gallon containers. The feasibility of this concept was demonstrated. As a consequence of the success already realized, it is probable that a practical and useful system, embodying this approach, can be developed. (EPA)

DATA ACQUISITION SYSTEMS IN WATER QUALITY MANAGEMENT,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
R. C. Ward.
Copy available from GPO Sup Doc as EP1.23/3:73-014, $2.85; microfiche from NTIS as PB-222 622, $1.45. Environmental Protection Agency, Socioeconomic Studies Series, Report EPA-R5-73-014, May 1973. 259 p, 25 fig, 9 tab, 10 ref. EPA Project 16090FUO.

Descriptors: Sampling, Information retrieval, *Network design, Cost comparisons, Monitoring, Operations, Data collections, Water quality control, *Colorado, *Water quality standards, *Regulation.
Identifiers: *Water quality management, *Data acquisition systems.

The role of routine water quality surveillance was investigated, including a delineation of the objectives of a state water quality program based upon the state and federal laws. Seven specific objectives are listed under the two general objectives of prevention and abatement: planning, research, aid programs, technical assistance, regulation, enforcement, and data collection, processing, and dissemination. Each objective was broken down into the general activities required for its accomplishment and the data needed for each activity were identified. A survey of systems for grab sampling, automatic monitoring, and remote sensing was performed, each data acquisition technique being analyzed for capabilities, reliability, and cost. A procedure was developed for designing a state water quality surveillance program responsive to objectives. The design procedure has two major aspects: (1) determination of the agency's control strategy, and (2) characterization of streams according to use and quality conditions. The optimum grab sampling network is then designed and possibilities of substituting automatic monitoring and remote sensing at various points in the network are explored. The design procedure was applied to the State of Colorado and a water quality monitoring system was developed for the Water Pollution Control Division of the Colorado Department of Health. Financial and manpower constraints were considered in the design. (EPA)

A. L. Strong, and J. C. Keene.
Copy available from GPO Sup Doc as EP1.23/3:73-018, $2.10; microfiche from NTIS as PB-222 587, $1.45. Environmental Protection Agency, Socioeconomic Studies Series Report, EPA-R5-73-018, May 1973. 116 p, 18 tab, 14 ref. EPA Project 16110 EDC.

Descriptors: *Attitudes, *Community development, Easements, Land tenure, Leases, Scenic easements, Zoning, Land use, *Land development, *Protection.
Identifiers: *Land use controls, Development corporations, Conservation easements, *Brandywine project.

The studies described are an integral part of a much larger study of land management for purposes of water resource protection. The larger study is popularly known as the 'Brandywine Project.' The research is classified into three principal categories: (1) research directly related to the Brandywine Project; (2) investigation of public regulatory and less than fee controls on development; and (3) shaping of the concept of a private development corporation. The research approach is predominantly legal and governmental. In all instances in which information is available, citizen response to the various development controls has been examined and is included in the research reports. The research conclusion is that greater use of large-scale public and private control of land development can not only contribute significantly to water resource protection but will also increase private benefits. Increasing use of these forms of controls is predicted despite a substantial amount of opposition from private landowners. (EPA)

A PROTOTYPE HIGH SEAS OIL RECOVERY SYSTEM: PHASE I--SYSTEM DEVELOPMENT, VOL. III,
Lockheed Missiles and Space Co., Sunnyvale, Calif.
W. T. Beran, B. Bruch, and K. R. Maxwell.
Available NTIS, Springfield, Va 22151 as AD-758 353, Price $3.00 printed copy; $1.45 microfiche. Coast Guard Office of Research and Development Final Project Report 724103.06.3, February 1972. 176 p.

Descriptors: *Oil spills, *Water pollution sources, *Pollution abatement, Methodology, Research and development, Water pollution control, Oil pollution, Ecology.
Identifiers: *Oil spill recovery.

Results are presented on the preliminary design and development of a high seas oil spill recovery system. Included are (1) tests of a unique oil recovery device, (2) scaling relationships for oil recovery, and (3) preliminary design of an oil recovery system. The oil recovery device consists of a series of vertical discs held in position by horizontal vanes which are attached on the disc peripheries. A stationary hollow trough is mounted through the center of the disc-vane assembly. Between the discs and attached to the top of the shaft are wipers. The discs, immersed less than their radius, rotate through the oil-water liquid to effect oil recovery. Calm water tests were made for 4-, 6-, and 8-ft devices in various oils and slick thicknesses. Results are also given for a 1/9-scale model of an 8-ft diameter device tested in a tow basin. Analyses include attempts to develop mathematical models of the recovery process, oil recovery predictions based on test data for a 4-ft diameter by 13-ft long device mounted on a catamaran, and analyses of catamaran motion response in various seaways. WATER POLLUTION: ENVIRONMENTAL IMPACTS AND MEANS OF CONTROL,
Rutgers-The State Univ., New Brunswick, N.J. Water Resources Research Inst.
W. Whipple Jr.
Eighth Annual Henry M. Shaw Lecture, Series in Civil Engineering, January 1973, Dept. of Civil Engineering, North Carolina State University, Raleigh, N.C., 26 p. OWRR-A-025-NJ (3).

Descriptors: *Environmental effects, Ecology, Environmental engineering, Water pollution, *Federal Water Pollution Control Act, Planning, *Water quality control.
Identifiers: Water quality planning, *Environmental impacts.

The enormous cost of projected water pollution control programs has not been justified by comprehensive planning, evaluated environmental advantages of clean water, or any scientific criteria. They are enjoined by simple rules-of-thumb and verbal criteria embodied in Federal legislation. Planning under the Water Resources Council has either not considered water quality or included arbitrarily prepared programs. Environmental impacts of future situations can only be properly evaluated if cognizance is taken of unrecorded pollution as well as recorded effluents. There is a great lack of data and of methodology of investigating environmental impacts; and the Federal Government, which should take the lead in making such investigations, has passed the responsibility back to the states and private institutions.

PESTICIDES, POLLUTION, AND FOOD SUPPLY,
Cornell Univ., Ithaca, N.Y. Dept. of Entomology.
D. Pimentel.
Environ Biol. Vol 72, No 1, p 1-38. 1972. Illus.
Identifiers: Apples, Birds, Cotton, Fish, *Food supply, Insects, Onion, Peach, Pest, *Pesticides, Pollution, Tobacco, Toxicity, *Insecticides.

An analysis was made of the available data on the extent of pesticides use on crop lands and losses of crops, both treated and untreated. If pesticides were not used, crop losses were estimated to increase 7% (representing $2.1 billion). Overall, except for supplies of crops such as apples, peaches, and onions, most food crops would not be seriously affected by discontinuing use of pesticides. Only 5% of this country's total crop acres receive insecticide treatment, and about half of this is applied to cotton and tobacco acres. Despite the large increases in insecticide use, crop losses due to insect pests are also increasing and are now estimated by the USDA to be nearly 13%. In part, these trends are due to the practice of substituting insecticides for sound bioenvironmental pest controls (e.g., crop rotation and sanitation) and also to higher consumer standards. Although pesticides should not be eliminated, a need exists to treat only when necessary, to reduce aircraft spray drift, and to reactivate sound bioenvironmental controls. Also, additional acreages of some crops could be profitably planted to offset crop losses due to pesticide reduction. Concerning the toxicity of pesticides, the prime danger appears to be to those who apply these poisons. Unfortunately, the available data on long-term, low-level effects of pesticides to public health are inconclusive. Existing levels of pesticide pollution already have been responsible for kills of some species of beneficial insects, fishes, and birds. This serious pollution has occurred when only a small percentage of the crop acres are being treated with pesticides. A systems approach to pest management, in which the multiple factors of pests, crop culture, costs, benefits, and risks to environment and health are evaluated, is suggested as meeting the needs of agriculture and society as a whole.--Copyright 1973, Biological Abstracts, Inc.

POLLUTION ABATEMENT PROGRAMS IN THE DELAWARE RIVER ESTUARY,
Delaware River Basin Commission, Trenton, N.J.
S. P. Gross.
In: Water - 1972, American Institute of Chemical Engineers Symposium Series No 129, Volume 69, 1973, p 414-421, 9 fig, 4 tab, 11 ref.

Descriptors: *Pollution abatement, *Delaware River Basin Commission, Delaware River, *Waste assimilative capacity, *Water quality standards, Dissolved oxygen, *Interstate commissions, Interstate rivers, *Estuaries, Water pollution control, Abatement, Biochemical oxygen demand, Effluents, Interstate compacts, Oxygen demand, Oxygen sag, Regulation, River Basin commissions, Scheduling, Tidal waters, Waste water, Waste water pollution, Waste water disposal, Waste water treatment, Water pollution, Water pollution effects, Water pollution sources, Water pollution treatment, Water quality, Water quality control.
Identifiers: *Allocations, *Abatement schedules, Water uses, Effluent quality requirements, Compliance, Water quality zones.

The program of the Delaware River Basin Commission (DRBC) to abate pollution in the Delaware River Estuary begun in 1968, which was undertaken to implement water quality standards adopted by the Commission in 1967, is the first to utilize the concept of allocation of stream assimilative capacity. Although abatement measures for most of the nearly 100 waste sources are either in the construction or planning steps, some abatement of waste discharges has occurred, and some minor improvements in stream quality have been observed. The significant features of the program are described, as well as initial, current, and projected waste discharge characteristics and stream quality conditions. (DRBC)

EFFECTS OF TEMPERATURE AND CHEMICAL TREATMENTS ON THE CHEMICAL COMPOSITION OF ALKALINE WATER,
Ministry of Agriculture, Bangkok (Thailand). Rice Dept.
P. Nammuang.
Thai J Agric Sci. Vol 5, No 3, p 203-225. 1972.
Identifiers: *Alkaline water, Ammonium, Calcium, Chemical composition, Hydroxides, Irrigation, Magnesium, Potassium, Salts, *Water chemistry, Water temperature, Chemical treatment.

As water temperature increased from 16 to 32C, the values of Na+, K+, and pH increased while the values of HCO3-, Ca++, Mg++ and electrical conductivity (EC) decreased. The reduction of such alkaline components was small compared to the amount of bases NH4OH, KOH and Ca salts of chloride and sulfate added to the water. The addition of NH4OH without Ca salt was not as effective in precipitating HCO3- and Ca++, regardless of temperature or concentration as was KOH. However, 500 ppm of K added at 32C was required to precipitate all of the bicarbonate. Ca salts added alone were not effective in removing bicarbonate. However, when Ca salts were added with the base at 250 ppm, the bicarbonate was completely removed. The combination of 500 ppm of KOH and Ca salt was the most effective treatment for removing alkalinity from the water. All the bicarbonates and most of the Ca and Mg were removed. The pH, EC, Na, K and use of NH4+ as NH4OH+ Ca salts are discussed.--Copyright 1973, Biological Abstracts, Inc.

Water quality degradation due to poor irrigati practices is being recognized in the western U.S a new context of socio-demographic conside tions, where problems of water manageme supply, utilization, reclamation, and conservati can no longer be solved without asking questi that were formerly avoided. As the largest c sumer of public water supplies, irrigated agric ture in the west is now being questioned seriou by those who ask if the government should p farmers not to till the soil in states with high ra fall while it subsidizes farm irrigation in states w low rainfall. Any discussion of the social aspe involved in water quality management proje must deal with such questions as the future water development projects for new irrigati larger considerations for an understanding agriculture in a changing society, the relations between man, technology, society, and envir ment. Technical recommendations include irri tion efficiencies through water measureme modification of long-established local customs water delivery and use; evaluation of methods treatment of soil salts; a water charge sched that will make the farmer cognizant of the need good irrigation practices; and modernization project facilities such as turnouts and ca linings. LEPTOMITUS LACTEUS (PHYCOMYCETES, OOMYCETALES, SAPROLEGNIACEAE) AS FOOD FOR COOT (FULICA ATRA) AT ARTIFICIAL POND OF DANUBE NEAR OEPFINGEN, (IN GERMAN),
J. Hoelzinger.
Anz Ornithol Ges Bayern. Vol 11, No 2, p 168-175. 1972. Illus. English summary.
Identifiers: Artificial ponds, *Coots, Danube, Fulica-Atra, Green-winged teal, Leptomitus-Lacteus, Domycetales, Phycomycetes, Ponds, Saprolegniaceae, Sphaerotilus-Natans, *Germany (Oepfingen), *Aquatic fungi, Waterbird diets.

In the winter of 1971-1972, coots were observed in an artificial pond in Oepfingen (16 km West of Ulm, West Germany) feeding almost exclusively on the aquatic fungus L. lacteus. Waste water drained from a factory into the Danube 8 km away. The contaminated river water fed the pond and resulted in an intensive bloom of Leptomitus. The fungus attaches itself to objects, but is later broken off by the force of the stream and washed into the pond where it sinks to the bottom in great quantities. Greatest productivity of Leptomitus was always between Nov. and March, at which time coots appeared in great numbers, up to as many as 6320. It is presumed that other water birds also feed on this fungus. Very probably flocks of green-winged teal feed on the aquatic bacterium Sphaerotilus natans, which also blooms in great quantities following the waste water introduction mostly in autumn and spring.--Copyright 1973, Biological Abstracts, Inc.

ENERGY IMPLICATIONS OF SEVERAL ENVIRONMENTAL QUALITY STRATEGIES,
Oak Ridge National Lab., Tenn.
E. Hirst.
Available from NTIS, Springfield, Va., as ORNL-NSF-EP-53; $4.00 in paper copy, $1.45 in microfiche. Report ORNL-NSF-EP-53, July 1973. 31 p, 2 fig, 9 tab, 49 ref.

Descriptors: *Energy conservation, *Environmental effects, Energy, *Environmental engineering, Environmental sanitation, Waste water treatment, Thermal pollution, Air pollution, Cooling towers, Cost-benefit analysis, Urban sociology, Pollution abatement, Costs, Tertiary treatment, Sewage treatment, Estuarine environment, *Water quality control.

The energy needed to operate fairly stringent environmental protection systems is small relative to total energy use and could be offset by improvements in energy-use efficiency that are indicated. Based on 1970 data, costs of hypothetical systems were: (1) urban passenger traffic (improved emission control offset by automobile redesign and a 10% shift to mass transit), 0.47% net decrease in total U.S. energy consumption; (2) secondary-level sewage treatment, 0.43% increase; (3) solid-waste management (landfills offset by incineration-power utilization and by recycle benefits), 0.97% net decrease; (4) air-pollution control at stationary sources), 1.25% increase; (5) dissipation of power-plant waste heat by cooling towers, 0.24% increase. To minimize piping and pumping in waste water treatment, a small plant (30,000 population equivalents) was assumed. Tertiary treatment is considered unlikely, and costs of water treatment are not included in this breakdown. Secondary treatment may allow marine-life survival and reduce algae growth. (Bopp-ORNL)

HEATING AND COOLING IN BATCH PROCESSES,
Proctor and Gamble Co., Cincinnati, Ohio.
T. R. Brown.
Chemical Engineering, Vol 80, No 12, p. 99-104, May 28, 1973. 4 fig

Descriptors: *Design criteria, *Heat transfer, *Mathematical studies, *Temperature, Heating, Cooling, Mechanical engineering, Design, Facilities, Equipment, Heat exchangers, Equations, Time, Heat load, Flow rates, Optimization.

A good understanding of heating and cooling operations of batch processes can minimize the number of design and start-up problems. Several easy-to-use equations are presented for cases in which there is a change of phase in the heat transfer medium and in which there is no change of phase in the transfer medium. These relations allow the following quantities to be calculated as a function of time: (1) batch temperature, (2) heat load or rate of transfer, (3) flowrate for a medium that changes phase, and (4) return or final temperature for the medium that does not change. Some typical design and start-up problems which can occur without this knowledge are discussed, such as insufficient process capacity, insufficient plant-utility capacity, high-cost designs, excessive flowrate of the heat transfer medium or temperature of the heat transfer liquid and poor start ups. The important relations presented are: temperature and time; heat load and time; medium flow rate and time; and medium outlet temperature and time. Computer programs developed from this data provide the ability to make many calculations in a short period of time, which is ideal for the study of alternates and for system optimization. IRRIGATION MANAGEMENT FOR CONTROL OF QUALITY OF IRRIGATION RETURN FLOW,
Utah State Univ., Logan. Dept. of Agricultural and Irrigation Engineering.
L. G. King, and R. J. Hanks.
Copy available from GPO Sup Doc as EP1.23/2:73-265, $3.45; microfiche from NTIS as PB-222 773, $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-265, June 1973. 307 p, 81 fig, 60 tab, 75 ref. EPA Project 13030 FDJ.

Descriptors: *Return flow, *Leaching, *Salinity, *Irrigation practices, *Colorado River Basin, Environmental effects, Water quality, Irrigation, Drainage, Soil water, Management, Drainage effects, Computer models, *Model studies, *Utah.
Identifiers: Return flow quality, On-farm water management, Salt storage, Irrigation scheduling, Salt movement, Irrigation frequency, Irrigation management, Field irrigation studies, Ashley Valley (Utah).

Field studies tested the possibilities for using the unsaturated soil profile including the crop root zone as a temporary salt reservoir and providing excess water for leaching and salt discharge when desired. Two models were developed for describing flow of water and salt through the soil with extraction of water by evapotranspiration. One model was designed for use as an irrigation management tool while the other model was initially intended to provide a detailed understanding of the water and salt flow through the soil. The best management model will probably result from a combination of the two models described. Timing of irrigation was tested as a management variable. With all other conditions the same, the model predicts that as the time interval between irrigations increases, the season totals of salt removed from the root zone, salt remaining in the profile, and water required for leaching tend to level off. However, the irrigation frequency has a significant effect upon when the salt is discharged during the season. Results indicate that managing irrigation for control of return flow quality requires good control of depth and timing of irrigation. Some needs for further research are given. (EPA)

Copy available from GPO Sup Doc as EP1.23/2:73-271, $3.20; microfiche from NTIS as PB-222 796, $1.45. Environmental Protection Agency, Technology Series Report, EPA-R2-73-271, June 1973. 285 p. EPA Project 13030 FVN.

Descriptors: *Fertilizers, Irrigated land, Irrigated systems, *Irrigation water, *Nitrates, *Phosphates, *Return flow, Salinity, Water pollution effects, Water pollution sources, Water quality control, Abstracts, *Bibliographies.

Research related to the quality of irrigation return flow is being conducted at numerous institutions throughout the western United States. Related work is also underway at other institutions in the United States, as well as other portions of the world. Approximately 100 sources of material have been searched for articles pertinent to the National Irrigation Return Flow Research and Development Program. These articles describe water quality problems resulting from irrigated agriculture, potential technological solutions for controlling return flows, recent research pertinent to return flow investigations, and literature associated with institutional constraints in irrigation return flow quality control. This second annual issue of SELECTED IRRIGATION RETURN FLOW QUALITY ABSTRACTS contains approximately 450 abstracts of documents published in 1970 and 1971. Author and subject indexes are included. (EPA)

RESEARCH NEEDS ON WASTE HEAT TRANSFER FROM LARGE SOURCES INTO THE ENVIRONMENT.
Illinois State Water Survey, Urbana.

December 1971. 37 p. GI-30971.

Descriptors: *Thermal powerplants, *Thermal pollution, *Environmental effects, *Heat transfer, Research and development, Electric power production, Heated water, Discharge (Water), Wastes, Cooling towers, Ponds, Lakes, Rivers, Biology, Biological community, Atmosphere, Meteorology, Evaluation, Technology, Management.

The data discussed and the findings and recommendations of a conference held at Zion, Illinois on September 20-24, 1971 are presented. A group of 27 experts from a broad cross-section of professional activities reviewed the knowledge of present and projected environmental effects resulting from large injections of waste heat into the environment by means of cooling towers, cooling ponds, lakes, and streams. Areas of research priority determined were: the social and economic pressures related to the installation of new technology; the biological consequences of the addition of waste heat to the environment; the effects of additional heat on atmospheric conditions; the establishment of effective predictive methods for the hydrological conditions brought on by the discharge of waste heat; and the technological developments which have recently occurred. Ways to achieve management and coordination of research efforts were presented. The need for additional environmental data, a clearing house for coordination of the data, education of the public, and interdisciplinary team research were emphasized. (Jerome - Vanderbilt)

Five main problem areas associated with water resource management are discussed. Public demand problems center attention on reaction to available information and the resulting greater awareness of the public. Alternatives lead to problems of the decision-making process, while other problems stem from the new attention given the persons who have quietly pursued the task of managing the environment. The remaining problems include financing -- how to fund and allocate needed projects; and organization -- determining which governmental branch should take the responsibility in matters concerning water quality control. The return of brines to their original subsurface formations is one of the methods by which positive disposal of brine is accomplished. Subsurface disposal is not always possible because of various difficulties encountered, but it is thought that where the formation has porous streaks large volumes of brine may be returned successfully upon proper preparation. It was found that all wells drilled for oil or gas in the test area should be completely cemented in order to prevent possible future contamination. Tests to determine the effects of back pressure on wells producing large volumes of salt water were recommended. Controlled dilution of brine by dumping into surface streams was seen as a disposal possibility for a part of the brine production in the area studied. (Campbell-NWWA)

6. WATER RESOURCES PLANNING

A. Techniques of Planning

TTITUDES OF RIPARIANS TOWARDS THEIR AKE ENVIRONMENTS: A STUDY OF LAKE YOLA AND DAMON POND, MAS-ACHUSETTS,
assachusetts Univ., Amherst. Dept. of Land-ape Architecture.
H. Martin, and L. G. Wegkamp.
vailable from the National Technical Informa-n Service as PB-222 485, $3.00 in paper copy, .45 in microfiche. Massachusetts Water sources Research Center Completion Report '-73-10, June 1973. 41 p. OWRR A-031-MASS).

escriptors: Planning, *Aesthetics, Economics, stitutions, *Massachusetts, *Lakes, Lake ores, *Recreation, Lake morphology, *At-udes.
entifiers: *Vacation homes.

This substudy hypothesized that irrespective of supply and demand, determinants exist which establish preferences for certain vacation or second home sites. Amongst these preferences are: proximity to unpolluted water with recreation potentials; a non-urban setting, preferably a wilderness area accessible to the permanent home location; a setting of some natural beauty with a combination of vegetative and topographical variety. Two lakes were selected to test the first variable, taking care to ensure all the other variables were held constant. The study found that (a) considerable recreational limitations occurred on the polluted lake due to physical and psychological factors (b) respondants were adverse to admitting that water was polluted and in any event discounted the deleterious environment effects of polluted water (c) configuration of shoreline, topography, orientation and access were noted as determinants of house location (d) morphology of water body interaction of shore configuration and water surface suggests important locational determinants and stimuli for community growth (e) building condition and building location are not necessarily functions of supply and economic factors.

Identifiers: *Millers River Watershed (Mass), Connecticut River (Mass), Diversity indices, Factor analyses.

SYMAP, a computer graphic program for data storage and retrieval with a map print out was tested for its applicability in planning. The study area chosen was the Millers River Watershed. A number of sub-problems were studied including overall economics; the economics of the wood using industries; industrial and municipal water use; the effects of pollution on aquatic biota; the role of vegetation and vegetation management as seen by the wildlife manager; and the aesthetic-cultural characteristics of land and water use. The analysis of the role of vegetation and vegetation management involved the only effort to directly use SYMP. The results of the study of aquatic biota produced a new program, DIVERSE, which promises to have application in the analyses of mixed species populations. In an adaptation of input-output analysis, water demand was demonstrated to be a predictable function of output data.

Identifiers: *Urban planning.

A data-organization chart in the form of a matrix may be used to guide the assessment of urban water resources. The matrix provides a means for determining the relative importance of water-related problems, and for identifying the data needed to evaluate these problems for the purpose of urban planning. The matrix columns list nine categories of potential water-related urban problems. The rows list 51 categories of data inputs which may be needed to evaluate the potential problems. The inputs include standard types of basic hydrologic data, information based on analysis and interpretation of these data, and information on the interfacing factors of climate, land, and culture. A system is described for ranking the relative importance of the problem categories and data inputs on a numerical scale of 0 to 3. From this, an index is derived that evaluates the relative importance of each input item to an overall program for water resource assessment. From the completed matrix the hydrologist can determine the availability of data to meet the identified requirements. Judgement can then be made as to priorities on work elements to provide the planner with maximum information in minimum time. The matrix also provides a basis for the development of programs and their funding in order to overcome critical data deficiencies. (Knapp-USGS)

Identifiers: Least cost, Multivariate minimization, Steepest descent method.

Presented is a method for optimizing the extension and operation of the natural regime network in areas not designated or designated for development, applied to hypothetical conditions in Canada. The methodology is based on the idea that hydrological networks consist not only of stations' time series of data, but also of a system of processing these data to obtain hydrological information, and time series of hydrological data at any point of the area covered by the network. The methodology consists of two distinct but related optimization processes, according to the prospectives of economic development of the area considered. The first process, applicable to that area not planned for development, involves determination of the main network characteristics which would optimize the network according to its internal objectives, such as least cost. The network according to its internal objectives, such as least cost. The technique applicable in this process is the multi-variate minimization by steepest descent method. The second optimization technique used, dynamic programming, is applicable to planning the natural regime network in which development is foreseen. This planning requires a forecast of the economic development and relationships between the errors of estimate of the hydrological characteristics and the losses incurred in the developments envisaged. Obtained is the optimum variation of network characteristics which would produce the largest benefit. (See also W73-13134) (Bell-Cornell)

Identifiers: *Urban water resources, *Bayesian methods, *San Angelo (Tex), Arid regions, Utility theory, Decision theory.

Presented is an analysis for optimum decision-making based on utility concepts to form an adaptive procedure for the planning and control of urban water resources. Decision and utility theory have the ability to evaluate unquantifiable factors or concepts. Employment of this logical decision procedure is very adaptable to environmental problems. These concepts attempt to include intagible factors relevant in the evaluation of alternatives in addition to monetary considerations, such as cost and profit. A method is given for determining a consensus of group opinion and its application within the framework of decision theory. The decision analysis technique is appropriate for problems of municipalities in arid regions. A procedure is presented for the use of subjective data in a decision situation related to urban water resource development. This is accomplished by developing a utility function for available courses of action and evaluating these in a logical and systematic manner. This approach to decision making is then applied, using a method for obtaining a group consensus, to the planning and water resource development problems confronting San Angelo, Texas, a city suffering from recurring problems in obtaining an adequate water supply. escriptors: Population, *Migration patterns, Employment opportunities, Labor mobility, Density, Statistical methods, Regression analysis, Model studies, Community development, Social aspects, Distribution patterns, Cities, *Regional economics, Forecasting, Income distribution, Resource allocation, *Human population.
Identifiers: *Demography, *Urban ecology, *Outmigration, State economic areas, Level of living, Population composition, Factor analysis.

It is postulated (1) that water resource needs are importantly affected by both size and composition of population dispersion, and (2) that migration patterns are the major sources of uncertainty in predicting population change. A predictive model of migration behavior was studied. Using principally multiple regression analysis on migration across State Economic Area boundaries in the form of out-migration rates for 1949-50, it is concluded that migration rates are a dynamic phenomenon dependent primarily on accessibility (transportation, communication, information, distance) and available opportunity (employment rates, income, amenities). However where accessibility is low (e.g., poor communication, great distance) out-migration is not significantly affected by differential opportunity. Also, accessibility variables were only effective when outmigration to nearest neighboring metropolitan area was considered. For out-migration to more distant areas, other accessibility variables were inconclusive. Finally, trait specific composition of community populations (color, age, education) was found not to effect out-migration rates; however, relative size of trait-specific groups effected out-migration of that group. A strong case is made for better statistical data. An appendix provides factor-analyzed characteristics with a table showing which factors may be deleted from analysis in favor of corresponding variables worth retaining. (Kaynor-Massachusetts)

Identifiers: Springfield-Chicopee-Holyoke Standard Metropolitan Statistical Area, Interviewing methods, Interest groups.

Two years of research are reported on the water resource decision-making process in the Springfield-Chicopee-Holyoke Standard Metropolitan Statistical Area (Connecticut River valley in Massachusetts). Decision-making was found to be contained by local jurisdictional fragmentation, citizen and official lack of interest in regional water resource problems, and perceptual distortion of the facts relating to water resource problems and plans. Conflicts between groups with mutually incompatible interests did not appear to be a significant constraint. A specific method is described for identifying 'interested and involved' participants in the decision-making process. With rough statistical correlational techniques, an apparent relationship is shown between respondent background characteristics (type and location of community of residence, employment classification, political party affiliation, and type of specialized education) and attitudes, values, or perceptions of water resource issues. The annotated bibliography of 37 pages covers much of the relevant literature through 1969. Recommendations include more formal metropolitanization, better water resource information dissemination, formalization of the role of consultants, maintenance of certain aspects of decentralized decision-making, and better specification in environmental impact statements of the metropolitan area effects of upstream water resource programs.

A COMPARISON OF CONSUMER'S SURPLUS AND MONOPOLY REVENUE ESTIMATES OF RECREATIONAL VALUE FOR TWO UTAH WATERFOWL MARSHES,
Utah Center for Water Resources Research, Logan.
C. H. Brink.
Available from the National Technical Information Service as PB-222 544, $4.75 in paper copy, $1.45 in microfiche. Completion report June 1973. 153 p, 11 fig, 26 tab, 41 ref, 5 append. OWRR B-015-UTAH (1). 14-31-0001-1562.

Descriptors: Recreation, Benefits, *Recreation demand, *Marsh management, Waterfowl, *Nonconsumptive use, *Utah, Hunting, Use rates, Expenditures, Income, *Cost comparisons.
Identifiers: Farmington Bay Waterfowl Management Area, Bear River Migratory Bird Refuge, Recreation benefits, *Waterfowl hunting.

Demand curves were estimated for waterfowl hunting and nonconsumptive recreational use from use rate and variable expenditure data collected at the Bear River Migratory Bird Refuge and the Farmington Bay Waterfowl Management Area during FY 1969. Consumer's surplus and monopoly revenue estimates were then derived from the demand functions. Adjusted estimates of consumer's surplus for waterfowl hunting amounted to $7,260 per year at Bear River and $11,400 per year at Farmington Bay. For nonconsumptive recreation annual consumer's surplus was estimated to be $18,700 at Bear River and $3,760 at Farmington Bay. Monopoly revenue estimates were between one-half and one-fourth the corresponding consumer's surplus estimates. The capitalized value (at 8% interest) of predicted annual consumer's surplus for all recreation was $865,000 for Bear River and $299,000 for Farmington Bay. Capitalization of the corresponding monopoly revenue estimates gave $276,900 for Bear River and $92,100 for Farmington Bay. At 3% interest, the capitalized consumer's surplus values increase to $4,242,000 for Bear River and $1,184,000 for Farmington Bay, while those for monopoly revenue increase to $1,330,000 for Bear River and $350,000 for Farmington Bay. Consumer's surplus estimates are more valuable than monopoly revenue estimates for comparison with other values included in the benefit/cost analysis of water development projects because the needed values include more than a nondiscriminating monopolist can extract.

Nebraska Univ., Lincoln. Water Resources Research Inst.
W. Viessman, Jr., and K. E. Stork.
Water Resources Bulletin, Vol 9, No 4, p 647-654, August 1973. 4 ref.

Descriptors: *Research and development, *Water resources research act, Environment, Ecology, Planning, Social aspects, Legal aspects, Water management (Applied).
Identifiers: *Technology transfer.

In recent years, important changes have occurred in water resources research. There have been major shifts in attitudes of Congress, state legislatures, and the general public toward water and related resource issues. Future water research and development will have to be environmentally oriented. Emphasis is shifting to research productivity. To justify research expenditures, hard facts must be produced which demonstrate payoff. Technology transfer (getting research results into the hands of users in an understandable and usable form) is gaining prominence. Research projects must be designed for total problem solution and technology transfer must be incorporated as a part of project objectives. Research must be planned and conducted to meet users' needs. Guidelines for modern research design and technology transfer are presented. (Knapp-USGS)

Descriptors: *Water resources development, *Decision making, *Project planning, *Forecasting, Benefits, Costs, Feasibility, *Risks.

Water resource developments are traditionally designed to be of service over long periods of time, often exceeding 100 years. The time stream of benefits and costs of such projects will be influenced by many factors difficult to forecast at present, such as future demands for project out-

puts, future importance of natural environments, and changes in institutions and policies. The uncertainty arising from the inability to forecast such future developments is termed 'strategic uncertainty.' Discussed is the problem of inadequate consideration of strategic uncertainty in decisions concerning water resource projects, due greatly to the close relationship between project beneficiaries, federal construction agencies, and Congress, and to the lack of internal and external forces requiring these factions to do otherwise. The National Environmental Policy Act of 1969 (NEPA) is an important vehicle for forcing adequate consideration of strategic uncertainty by water resource development decision makers. Presently, Congress, state governors and agencies, and the general public lack the necessary expertise and resources to provide an effective independent review of proposed water resource developments. NEPA requires federal water resource development agencies to prepare and publish an objective data base on the proposed project and alternatives. (See also W73-13134) (Bell-Cornell)

Water resources planning in the United States has evolved from a limited purpose engineering function into a complex multi-objective process. During the nation's early growth and development, change was at a slow pace, mirroring the slowly changing structure. Today, however, change is rapid, and new and different trends emerge and can interact to produce many unprecedented variations in the social, economic, and technological environments. This potential for numerous new variations introduces uncertainties of a new and different type that can easily dominate engineering uncertainties associated with the design of physical works. Therefore, the water resources planner of today faces an ever-broadening set of complex issues and must deal with uncertainties of a much more profound nature than in the past. Preliminary results are presented from exploratory research to develop ways to assess the implication of potential changes in social values and priorities on water resources planning. An intuitive forecasting technique--the Delphi method--is employed to identify some potential concerns and priorities that may frame and define water resources requirements of the future. TREATMENT OF SOME OF THE UNCERTAINTIES ENCOUNTERED IN THE CONDUCT OF HYDROLOGIC COST-EFFECTIVENESS EVALUATIONS,
North American Rockwell Corp., Downey, Calif. Space Div.
A. D. Kazanowski.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 771-785, (1972). 3 fig, 2 tab, 17 ref.

Descriptors: *Hydrologic systems, *Costs, *Evaluations, *Social aspects, *Technology, *Methodology, *Risks.
Identifiers: *Cost-effectiveness, PERT techniques, Delphi method.

Guides that might be beneficial to reducing some of the uncertainty surrounding the conduct of cost-effectiveness evaluations, particularly of hydrologic systems, are identified and briefly described. The three major sources of uncertainty discussed are associated with determination of goals, selection of criteria, and identification of the uncertainty surrounding cost estimates. Goals for hydrologic systems should reflect both technical and societal considerations. Technical considerations tend to be discrete and readily identifiable, and societal goals tend to be pervasive (based on value systems) and transitory. The pervasive interrelationships of goals can be analyzed through the Delphi technique, relevance trees, or cross-purpose matrices. A methodology is described for determining confidence limits about the total program cost estimate; the procedure uses PERT-type generation of cost statistics and the characteristics of the Beta distribution. A grasp of the uncertainty inherent in a system cost estimate can be obtained through the application of PERT techniques to the cost estimates of the system elements. The 10-step standardized approach presented can provide the basic methodology for conducting cost-effectiveness evaluations of the societal systems or systems with a substantial societal impact; however, the evaluation of these systems requires increased sensitivity and perception into the subtleties of the steps beyond that of the basic methodology. A REPORT ON CORPS OF ENGINEERS RESEARCH ON THE MANAGEMENT OF UNCERTAINTY IN WATER RESOURCES PLANNING,
Decision Sciences Corp., Jenkintown, Pa.
J. A. Orlando, and E. W. Weber.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 786-800, (1972). 3 fig, 1 tab, 4 ref.

Descriptors: *Water resources, *Long-term planning, *Methodology, Estimating, Management, *Risks.
Identifiers: Impact, Error, Monetary costs, Non-monetary costs, Knowledge, Information.

The Army Corps of Engineers is sponsoring a number of studies for improving the long-range water resource planning techniques utilized by the Corps' planners. One such study which develops a methodology for management of uncertainty in water resource planning is described. 'Management of uncertainty' refers to dealing with uncertainty in such a way as to reduce the impact of the uncertainty insofar as the consequences of planning decisions are concerned. The nature of the uncertainties and the techniques which are currently being used to meet the problems resulting from the uncertainties are discussed. Then, the approach being taken in this project to identify the uncertainties the planner must deal with, to determine their significance, estimate the 'costs' of the uncertainty, and to estimate the impact of these uncertainties is described. Presented also are some possible methods of using available information and knowledge to reduce the impact of uncertainty in planning. In this study, the 'cost' of uncertainty includes the monetary and non-monetary cost of errors resulting from insufficient information, and the cost of obtaining additional information. W73-13155

THE MARGIN OF SAFETY FOR COMPENSATING LOSSES DUE TO UNCERTAINTIES IN HYDROLOGICAL STATISTICS,
Research Inst. for Water Resources Development, Budapest (Hungary).
I. Bogardi, and F. Szidarovszky
In: Proceedings (Vol II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 835-852, (1972) 6 fig, 1 tab, 13 ref.

Descriptors: *Water management (Applied), *Projects, Hydrology, *Statistics, *Design, *Probability, Benefits, Compensation, Damages, Analytical techniques, Flood plains, Methodology, Cost-benefit analysis, Simulation analysis, Mathematical models, Systems analysis, *Risks.
Identifiers: *Margin of safety, Economic losses, Flood levees.

A method is presented for estimating the margin of safety, by which the economic losses due to uncertainties caused by finite length of observation can be minimized in water management projects. Design value is available as a result of earlier economic analysis, or is specified officially. The design probability pertaining to this value is obtained from the distribution function F/h/ estimated on the basis of the n year long record. The value pertaining to the design probability is not an exact one, but its empirical distribution can be determined using a simulation method. If the distribution F/h/ is a normal one, the expected value and standard deviation of distribution for the value pertaining to the design probability can be found by analytical methods. A practical sample is presented and the relations existing between the magnitude of uncertainty and the level of design probability, on the one hand, and the margin of safety and the length of observation on the other, are introduced. The shorter the length of observation available, and the greater the benefits accruing from the project, of the damage averted, and further the higher the level of design probability, the wider the necessary margin of safety. DECISION MAKING IN WATER RESOURCE ALLOCATION,
Oregon State Univ., Corvallis. Dept. of Anthropology.
C. Brown, J. G. Monks, and J. R. Park.
Oregon Water Resources Research Institute Completion Report, 1972. 143 p, 24 fig, 21 ref, 3 appen. OWRR-B-016-ORE (2).

Descriptors: Water resources, *Resource allocation, *Decision making, *Planning, *Computer models, Data collections, *Oregon, Linear programming, Statistical models, Optimization, River basins, Political aspects, Social aspects, Economics, Watersheds (Basins), Governments, Networks, Mathematical models, Systems analysis, *Water allocation (Policy).
Identifiers: *Economizing techniques, *Willamette River basin (Ore).

A study is reported to delineate, classify and assess the importance and relationship of social-cultural, political and economic inputs to the decision making process in water resources allocation. Standard techniques of data collection and analy-

s were employed throughout the investigation hich studied specifically the Junction City Water ontrol District (JCWCD), located in the Wilmette Valley, Oregon. Major sources of data ere persons living within or associated with adinistration of JCWCD and various local, state, id federal government agency personnel. Of ime significance among study findings was the xistence and interaction of different economizing chniques which actually accomplish the water source allocation. Besides the importance of the icing system with its economic cost benefit conderations, other major economizing techniques democratic, bureaucratic and bargaining power tivities were very much in evidence. A resource location model formulated in terms of network ows, presented problems of assigning value units political and social inputs and changing decision iteria and was ruled impractical. A new linear ogramming model shown to have promise is esented. The judicial system appears to hold uch promise for measuring social outcomes and uld substantially improve resource allocation tivities by broadening the base of benefits and sts to social and cultural values. UNCTIONAL AND PSYCHOLOGICAL INEGRATION IN A RURAL COMMUNITY,
nnsylvania State Univ., University Park. Dept. Agricultural Economics and Rural Sociology.
M. Byler.
Sc Thesis, March 1973, 57 p, 23 tab, 35 ref. WRR A-017-PA (1). 14-31-0001-3538.

escriptors: *Flood-control, Reservoirs, Pennsylvania, *Rural sociology, Rural areas, Psychological aspects, Social aspects, *Attudes, Behavior.

his analysis examined the relationship between nctional and psychological integration for inviduals living in a rural Central Pennsylvania mmunity. The nature of integration was subject changes brought about by the construction of a od-control reservoir which physically bisected e original community. Psychological integration as measured by (1) a seven item scale resulting in mean of 94 and a variance of 422 where the west and highest possible values were 7 and 119 spectively (N±430) and (2) self-reported comunity identification. Functional solidarity scores ere derived based on use of services in the intutional areas of retail trade, banking, religion id employment resulting in a mean of 1.2 where e lowest and highest values were 0 and 4 respecvely. Self-reported identification was related sitively at P<.01 with each of the four measures functional integration and the solidarity index. ariations in functional integration were not sigficantly related to variations in the psychological tegration scale scores.

UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY: VOLUME I, MAIN REPORT.

Available from UMRCBSCC, 2120 L St NW, Washington, D C 20037, Price $4.00. Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC), Report, Washington, D C, Vol 1 of 9 volumes, 1972. 133 p, 40 fig, 33 tab.

Descriptors: *Water resources development, *Mississippi River basin, *Projections, Investigations, Reviews, *Evaluation, Aesthetics, Social aspects, Climatology, Meteorology, Hydrology, Surface waters, Groundwater, Geology, Mineralogy, Sediment transport, Water supply, Water quality control, Flood control, Navigation, Recreation, Fish, Wildlife, Powerplants, Agriculture, Water policy, Legal aspects, Economics, *Project planning.

This study was prepared at field level and presents data for a framework program for the development and management of the water and related land resources of the Upper Mississippi River basin. The main report summarizes the findings of the 17 supporting appendices. The water and related land resources of the basin are ample. There are opportunities for further resource development. Conservation and development of the resources are needed if the basin is to maintain its relative position in the national economy. The study presents the needs for water and related land resources and a framework for development of such resources. The estimated total first cost of the recommended framework for development is $28.5 billion of which $13.2 billion is Federal and $15.3 billion is non-Federal. The annual investment ranges from $31 per capita in 1980 to $44 per capita by 2020. The current annual rate of investment is about $27 per capita. Recommendations include approval and adoption of the framework by the Federal Government and the seven basin states, further studies to develop details of the framework, periodic review of the framework, and continuation of the present Coordinating Committee pending organization of the Upper Mississippi River Basin Commission. (See W73-13481 thru W73-13497) (Woodard-USGS)
W73-13480

UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY, APPENDIX A--HISTORY OF INVESTIGATION.
Corps of Engineers, Chicago, Ill. North Central Div.

Vol 2 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $4.50. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC) Report, Washington, D.C., Vol 2 of 9 volumes, p A1-A61, 1970. 8 fig, 3 tab, 8 ref.

Descriptors: *Water resources development, *Mississippi River basin, *Projections, Investigations, Reviews, Evaluation, Planning, Economics, Legal aspects, Programs, Hydrology, Surface waters, Groundwater, Fluvial sediments, Agriculture, Meteorology, Mineralogy, Water supply, Water quality control, Navigation, Recreation, Fish, Wildlife, Powerplants, Management.
Identifiers: *Upper Mississippi River basin.

The history, organization, and procedures used by the Coordinating Committee in the preparation of the Upper Mississippi River Comprehensive (Type 1) Basin Study are described. The appendix recounts the history of the study from events leading to the formation of the Coordinating Committee through the completion of the Committee Report. Many representatives of Federal and State agencies and private consultants contributed to the study; their work assignments and tenures are listed. The main topics include history of water resource planning and development, organization and procedures, basic resource studies, economic and legal studies, functional use studies, approach to planning, and information programs. (See also W73-13480) (Woodard-USGS)
W73-13481

UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY, APPENDIX B--AESTHETIC AND CULTURAL VALUES.

Vol 2 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $4.50. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC) Report, Washington, DC, Vol 2 of 9 volumes, p B1-B374, 1970.

Descriptors: *Water resources development, *Mississippi River basin, *Aesthetics, *Environmental control, Maps, Topography, Vegetation, Surface waters, Groundwater, Wildlife, Land resources, Geology, Soil types, Land use, Water resources, Mapping, Management.
Identifiers: *Upper Mississippi River basin.

As a part of the Upper Mississippi River Comprehensive Basin Study, Appendix B identifies natural environmental systems by showing topography, vegetation, and water areas on maps. Designated on the maps are symbols indicating such natural features as wildlife, vegetation, land forms, water areas and water in motion; and such cultural resources as historic, archaeological, and modern structural developments. Symbols express special features of outstanding or better-than-average quality and are worthy of consideration in advance of developmental planning. This new form of environmental resource inventory can be added as an overlay to the existing basic inventory maps of soil, topography, land use and cover, water resources, etc. The inventory mapping not only identified outstanding natural systems in the watershed, but clearly indicates where present and projected development may well destroy environmental quality. (See also W73-13480) (Woodard-USGS)
W73-13482

UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY, APPENDIX C--CLIMATOLOGY AND METEOROLOGY.
Army Engineer District, St. Louis, Mo.

Vol 3 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $4.50. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC) Report, Washington, DC, Vol 3 of 9 volumes, p C1-C56, 1970. 40 fig, 13 tab, 34 ref.

Descriptors: *Water resources development, *Mississippi River basin, *Climatology, *Meteorology, Reviews, Meteorological data, Rainfall, Snow, Sleet, Humidity, Dew point, Evaporation, Evapotranspiration, Fog, Water resources, Temperature, Winds, Storms, Hurricanes., Floods, Environmental damage, Forecasting.
Identifiers: *Upper Mississippi River basin.

The various aspects of climate in the Upper Mississippi River basin and the activities of private, local public, state and Federal agencies working in this field are described. Previously published materials are used as sources of information. The climatological and meteorological picture is on a local, state, and regional basis, without regard to river basin boundaries. Consequently, the subject matter is not strictly confined to the basin, but is reasonably representative of it. A glossary of generally unfamiliar terms is included. Normal annual precipitation ranges from about 20 inches in the northwest to about 46 inches in the south. Thunderstorms are the source of a large part of the total precipitation; they are also responsible for

flash floods, lightning, and damaging winds. Lightning annually causes from 2 to 5 deaths per million population and from $3 to $8 million per basin state in losses to farm buildings. Hail, another byproduct of thunderstorms, causes an annual loss of $22 million in livestock, automobiles, and crops in the principal five states of the basin. Generally, runoff into basin streams is adequate because precipitation amounts exceed those losses incurred through the soil by transpiration and evaporation. (See also W73-13480) (Woodard-USGS)
W73-13483

UPPER MISSISSIPPI COMPREHENSIVE BASIN STUDY, APPENDIX D--SURFACE WATER HYDROLOGY.
Army Engineer District, St. Paul, Minn.

Vol 3 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $4.50. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC) Report, Washington, DC, Vol 3 of 9 volumes, p D1-D113, 1970. 50 fig, 8 tab, 26 ref.

Descriptors: *Water resources development, *Mississippi River basin, *Surface waters, *Hydrology, Reviews, Projections, Hydrologic data, Data collections, Streamflow, Runoff, Flow rates, Floods, Peak discharge, Droughts, Base flow, Evaporation, Reservoirs, Water storage, Flood forecasting, Weather forecasting.
Identifiers: *Upper Mississippi River basin.

This appendix (D), contains hydrologic data pertinent to analysis of water and related land resource problems and to the formulation of a comprehensive framework plan for the solution of such problems in the study area. Surface water hydrology, as used in this appendix, can be defined as the measurement, collection, and organization of surface water runoff data and interpretation of results. Runoff data are presented in a variety of ways. Maximum, average, and minimum runoff rates are tabulated for various time intervals. Flow duration, flood frequency, flow storage, and mass curves are included. Infiltration indexes and evaporation data are also included. In conjunction with runoff data several existing the potential reservoir sites have been investigated, and pertinent information relative to these sites is included. (See also W73-13480) (Woodard-USGS)
W73-13484

UPPER MISSISSIPPI COMPREHENSIVE BASIN STUDY, APPENDIX E--GROUND WATER AND GEOLOGY.

Vol 3 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $4.50. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC) Report, Washington, DC, Vol 3 of 9 volumes, p E1-E74, 1970. 22 fig, 12 tab, 119 ref.

Descriptors: *Water resources development, *Mississippi River basin, *Groundwater resources, *Hydrogeology, *Aquifers, Hydrologic data, Geology, Aquifer characteristics, Water wells, Water yield, Water quality, Groundwater recharge, Water utilization, Water supply, Projections, Planning.
Identifiers: *Upper Mississippi River basin.

The groundwater resources of the study area are large and highly developed in a few urban-industrial centers. Those conducting comprehensive basin planning must therefore consider where this resource may be tapped, its adequacy for various categories of use, and how it can be managed to best advantage. This report was prepared in accord with the following specific set of objectives: (1) to present a general description of the groundwater hydrology of the basin, with emphasis on potential sources of large supplies adequate for municipal or industrial use; (2) to present the information in such a manner as to be readily usable in the formulation of long-range plans and as a guide for water management decisions by public water action agencies; and (3) to point out hydrologic factors that have become apparent in earlier studies that should be taken into consideration in formulating water resource management plans. (See also W73-13480) (Woodard-USGS)
W73-13485

UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY, APPENDIX F--MINERAL RESOURCES.
Bureau of Mines, Twin Cities, Minn. Twin Cities Office of Mineral Resources.

Vol 3 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $4.50. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC) Report, Washington, DC, Vol 3 of 9 volumes, p F1-F122, 1970. 26 fig, 75 tab, 125 ref.

Descriptors: *Water resources development, *Mississippi River basin, *Mineralogy, Metals, Coals, Petrography, Natural resources, Reviews, Gravels, Sands, Clays, Mining, Transportation, Navigation, Environmental effects, Planning, Projections, Management.
Identifiers: *Upper Mississippi River basin.

Mineral resources are described as one part of the comprehensive study of water development and land utilization of the Upper Mississippi River basin. The study estimates mineral resource potential and evaluates solid and liquid mineral fuel production. These factors are related to water use, water availability, and water pollution. The causes and extent of such pollution are investigated and possible corrective measures are offered. In addition, land utilization is studied. All of these factors are evaluated for present conditions and for projections for the future. Mineral resources in the basin may be divided into two groups: export commodities, transported from their origins out of the region; and residentiary commodities, used locally or moved only small distances from their origins. Export mineral commodities are coal, iron ore, lead concentrates, zinc concentrates, industrial sands, dimension stone, natural gas, petroleum, natural abrasives, and some sand and gravel. Residentiary mineral commodities are sand and gravel, crushed stone, marl, clay, shale, and some dimension stone. (See also W73-13480) (Woodard-USGS)
W73-13486

UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY, APPENDIX G--FLUVIAL SEDIMENT.
Army Engineer District, Rock Island, Ill.

Vol 3 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $4.50. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC) Report, Washington, DC, Vol 3 of 9 volumes, p G1-G100, 1970. 50 fig, 12 tab, 54 ref.

Descriptors: *Water resources development, *Mississippi River basin, *Fluvial sediments, Sedimentology, Sediment transport, Sedimentation, Sediments, Streamflow, Sediment yield, Reservoir silting, Particle size, Sediment distribution, Land use, Sediment control, Erosion control, Planning, Environmental control, Management.
Identifiers: *Upper Mississippi River basin.

A general appraisal is provided of sedimentation and related problems in the study area. This appraisal is made because of the importance of sediment in the overall management of water and related land resources. This includes a definition of the sediment problems, the areal distribution, magnitudes, variability, characteristics of sediment, and trends in sediment yields. The appraisal is based on available data from State and Federal agencies actively engaged in the collection of such data during the last two to three decades. A primary objective is to evaluate the problems in water resources development which have been caused by the presence of sediment in streams and reservoirs, and which will have an important bearing on the future water resources development in the basin. A means is provided to estimate the probable rate of sediment deposition in reservoirs. Information useful in solving sediment problems involving water treatment, damage to land, channels, recreational facilities, reservoirs, and transportation facilities is also provided. The dollar damage from sediment is estimated. (See also W73-13480) (Woodard-USGS)
W73-13487

UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY, APPENDIX H--WATER SUPPLY AND QUALITY CONTROL.
Federal Water Quality Administration, Chicago, Ill. Great Lakes Region.

Vol 4 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $3.00. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC) Report, Washington, DC, Vol 4 of 9 volumes, p H1-H342, 1970. 20 fig, 212 tab, 112 ref.

Descriptors: *Water resources development, *Mississippi River basin, *Water supply, *Water quality control, Reviews, Planning, Projections, Water demand, Industrial water, Municipal water, Groundwater resources, Surface waters, Water pollution sources, Municipal wastes, Industrial wastes, Agricultural chemicals, Urbanization, Sediments, Water pollution control, Economics, Flow augmentation.
Identifiers: *Upper Mississippi River basin.

Guides are provided to future water resource development in the study area by indicating which subareas have water problems calling for future detailed planning efforts. In addition, the study outlines the characteristics of projected water and related land resource problems and the general approaches that appear appropriate for their solution, consistent with the best use of combination or uses of water and related land resources to meet all foreseeable short- and long-term needs. The study includes: collection of basic data on municipal and industrial water uses and all waterborne wastes; preliminary evaluation of the natural characteristics and capability of surface water to assimilate wastes; and the projections of municipal and industrial water needs and various types of wastes to the year 2020. Using the data collected and the preliminary evaluations as a basis, mathematical projections of total water requirements were made in order to furnish preliminary estimates of the storage needs for municipal and industrial water supply and for quality control water. ER MISSISSIPPI RIVER COMPREHENSIVE IN STUDY, APPENDIX K--RECREATION.
au of Outdoor Recreation, Ann Arbor, Mich. Central Region Office.

5 available from UMRCBSCC, 2120 L St NW, nington, DC 20037 - Price $4.50. In: Upper issippi River Comprehensive Basin Study rdinating Committee (UMRCBSCC) Report, nington, DC, Vol 6 of 9 volumes, p K1-K126, 75 fig, 41 tab, 95 ref.

Descriptors: Water resources development, *Mississippi River basin, *Recreation, *Water sports, Reviews, Planning, Projections, Economics, Human population, *Tourism, *Land use, Topography, *Recreation facilities, Employment, Social aspects, National parks, Management.

Appendix K is a joint cooperative effort of the various state and Federal agencies who served as members of the Recreation Advisory Committee. The consideration of outdoor recreation opportunities is an important aspect of the overall study. Specificially, the outdoor recreation portion of the study seeks to: (1) inventory existing and potential recreation resources in the basin; (2) determine use pressures on existing facilities and the immediate demand for additional developments; (3) establish long-range needs and goals for providing adequate recreational opportunities to the year 2020; and (4) recommend a plan of action or programs for increasing present and future resource capabilities for satisfying recreation requirements. Recreation is a major industry in the basin. It dominates the economies of the tourist destination counties in northern Wisconsin and Minnesota. Recreation adds nearly 1 billion dollars annually to the state's economy. In addition, outdoor recreation provides nearly one-fifth of the total state employment and accounts for over 80 percent of the summer weekend highway peak loads. (See also W73-13480) (Woodard-USGS)

UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY, APPENDIX L--FISH AND WILDLIFE RESOURCES.
Bureau of Sport Fisheries and Wildlife, Minneapolis, Minn.

Vol 6 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $4.50. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC), Report, Washington, DC, Vol 6 of 9 volumes, p L1-L103, 1970. 23 fig, 23 tab, 33 ref.

Descriptors: Water resources development, *Mississippi River basin, *Fish, *Wildlife, Reviews, Water quality control, *Sport fish, Commercial fishing, Economics, Fisheries, Climates, Vegetation, Soils, Water resources, Human population, Transportation, Agriculture, Industries, Water pollution control, Water quality, *Planning, *Projections.

Appendix L is the joint effort of numerous State and Federal agencies working through a Fish and Wildlife Advisory Committee. Plans for meeting needs for sport fish and wildlife opportunities fall under several broad categories. They are geared in scope and number to the problems of the particular basin subarea. In general, planners, political authorities, and management experts attempt to accomplish the following: (1) increase the utilization of existing resources through improved access, increased acquisition of public-use fish and wildlife facilities near metropolitan areas, greater emphasis on under-utilized species, and creative enhancement techniques on available habitat; (2) firm and immediate correction of degrading pollution problems; (3) better communication between Federal and State conservation agencies and between agencies with varying or conflicting interests in basin natural resources; (4) continued acceleration of research studies on pesticides, thermal effects, and other expanding pollution problems; and (5) preservation of unique environmental systems which will otherwise be lost to future generations. Vol 6 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $4.50. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC), Report, Washington, DC, Vol 6 of 9 volumes, p M1-M68, 1970. 23 fig, 29 tab.

Descriptors: Water resources development, *Mississippi River basin, *Hydroelectric power, Reviews, *Planning, Projections, Electric power demand, Economics, Costs, Human population, *Industries, *Powerplants, Cooling water.

Future electric power requirements and supply in the study area are discussed. The projections of future electric power needs are made, not only to determine the probable effect on the basin economy and use of its natural resources, such as fuel, but to develop estimates of future needs for cooling water. The Upper Mississippi River basin (UMRB) is that portion of the north-central United States encompassing the Mississippi River and all streams draining into it above the Ohio River excluding the Missouri River. The area covers the larger parts of Minnesota, Wisconsin, Illinois, and Iowa; and reaches into Indiana, South Dakota, and Missouri. In 1960 the UMRB Power Region, with an area of 178,000 square miles, had a population of 18,805,477 accounting for 5% of the area of the nation and 10.5% of the population. The average population density of 106 per square mile is slightly more than double the national average. Population density varies considerably within the basin. The total energy requirement for the region in 1960 was less than 100 billion kWh. The projected energy requirement for the year 2020 is more than 1600 billion kWh. UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY, APPENDIX N--AGRICULTURE.
Soil Conservation Service, Washington, D.C.

Vol 6 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $4.50. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC), Report, Washington, DC, Vol 6 of 9 volumes, p N1-N210, 1970. 64 fig, 112 tab, 25 ref.

Descriptors: Water resources development, *Mississippi River basin, *Agriculture, *Crop production, *Planning, Projections, Reviews, Natural resources, Climates, Topography, Geology, Land use, Water resources, Economics, Flood protection, *Irrigation, Groundwater, Surface waters, Water supply, Water quality, Water pollution control.

Appendix N was prepared by the Soil Conservation Service, Forest Service, and Economic Research Service, in the Department of Agriculture. The study of agricultural land and water use and development was based upon an economic analysis which includes consideration for the basin's share of the nation's demand for food, feed, and fiber. This share included projected domestic demands plus export requirements. The methodology recognizes a physical and economic interrelationship between watersheds and subareas and between projects in the plan formulation. This relationship introduces a broader scope to the study than would be obtained if individual areas and projects were considered separately. Three systems were used for delineating subparts of the basin to develop data. These were: (1) hydrologic subareas, (2) basin plan areas, and (3) economic subregions. The planning area of 302 counties in seven states is somewhat larger than the 189,037 square-mile drainage area of the basin. (See also W73-13480) (Woodard-USGS)
W73-13494

UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY, APPENDIX O--STATE AND

FEDERAL WATER LAWS, POLICIES, AND PROGRAMS.
Corps of Engineers, Chicago, Ill. North Central Div.

Vol 7 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $4.50. In: Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC), Report, Washington, DC, Vol 7 of 9 volumes, 1970. 559 p, 1 fig, 4 tab, 83 ref.

Descriptors: Water resources development, *Mississippi River basin, *Water law, *Water policy, Programs, *Federal Government, *State governments, Water supply, Water demand, Economics, Agriculture, Industries, Urbanization, Public health, Water utilization, Water quality, Water pollution control, Surface waters, Groundwater, Land use, Management, Legal aspects, Water rights, Environmental control.

Appendix O was prepared jointly by the U.S. Army Engineer District, Chicago, and the states of Illinois, Indiana, Iowa, Minnesota, Missouri, South Dakota and Wisconsin. Executive policies, standards, and procedures have been established for uniform application in the formulation, evaluation, and review of comprehensive river basin plans and individual project plans for use and development of water and related land resources. The basic objective in the formulation of plans is to provide the best use, or combination of uses, of water and related land resources to meet all foreseeable short- and long-range needs. In pursuit of this basic conservation objective, full consideration is given to the development, preservation, and well-being of the people. Water laws of the states which are included in the Upper Mississippi River basin are based on the riparian doctrine. This provides that owners of the land along a stream share equally in the use of the water, as long as each riparian owner is reasonable in his use. However, each land owner's right to make reasonable use of the water is limited by the equal right of all other land owners along the same watercourse. (See also W73-13480) (Woodard-USGS)
W73-13495

UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY, APPENDIX P--ECONOMIC BASE STUDY AND PROJECTIONS.
Vol 8 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $2.00. Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC) Report, Washington, DC, Vol 8 of 9 volumes, 1970. 194 p, 61 fig, 107 tab.

Descriptors: *Water resources development, *Mississippi River basin, *Economics, *Projections, Regional economics, Social aspects, Human population, Labor supply, Wages, Industries, Employment, Agriculture, Land use, Livestock, Forestry, Mineralogy, Electric power industry, Recreation, Navigation, Flood control.
Identifiers: *Upper Mississippi River basin.

The economic base study and projections are presented for developing necessary information regarding the future economic and demographic changes of the study area to serve as guides for the development of water resource requirements or demands. These demands are projected based on the information supplied in this appendix and, together with related materials, will be used as the basis for determining the water and related land resource needs and the required development. Summary statements are included of methodologies proposed for use by Federal agencies and states in developing the demands that have been placed upon water resources based on the projections. On the basis of the data and projections developed, quantitative, qualitative and time-phased requirements for present and future control, use, and conservation of water in related land resources of the basin will be determined by the Federal agencies and states cooperating in this study. The plan to be developed will be for flood control, navigation, hydroelectric power, municipal and industrial water supply, water quality control, recreation, fish and wildlife conservation, agriculture, forestry, and other water related land uses. (See also W73-13480) (Woodard-USGS)
W73-13496

UPPER MISSISSIPPI RIVER COMPREHENSIVE BASIN STUDY, APPENDIX Q--FRAMEWORK FOR DEVELOPMENT.

Vol 9 available from UMRCBSCC, 2120 L St NW, Washington, DC 20037 - Price $3.00. Upper Mississippi River Comprehensive Basin Study Coordinating Committee (UMRCBSCC), Report, Washington, DC, Vol 9 of 9 volumes, 1972. 306 p, 75 fig, 132 tab.

Descriptors: Water resources development, *Mississippi River basin, *Management, Surface waters, Groundwater, Water supply, *Water demand, Natural resources, Water quality, Water pollution control, Land use, Flood control, *Land management, Economics, Legal aspects, Social aspects, Human population, Forestry, Industrial water, Municipal water, Agriculture, Recreation, Fish, Wildlife, Urbanization, Sediments, Erosion control, Urbanization, *Planning, Projections, Programs, Environmental control.
Identifiers: *Regional development guidelines.

A comprehensive framework is presented to solve problems and meet future needs for water and related land resource development in the study area. Guidelines published by the Water Resources Council were followed. These guidelines provided for a preliminary or reconnaissance-type investigation intended to provide broad-scale analyses of water and related land resource problems, and to furnish general appraisals of the probable nature, extent, and timing of measures for their resolution. The Plan Formulation Task Group combined the information included in the sixteen resource appendixes and the individual suggestions in the appendixes into a broad framework for meeting the identified needs. The group also took into account the interacting nature of many requirements in the planning process. The studies in the appendixes define the availability of water and related land resources within the basin. The economic studies describe the present and past population and employment trends of the basin as well as the projected level of the economy and related growth factors. Legal studies summarize the basin information on laws and regulations involving ownership, control, and use of the water resources within the basin. The special purpose studies present an inventory of existing development, determined projected demands for goods and services, and described single-purpose plans to meet identified net needs. The framework is directed towards satisfying the needs of people, and is flexible enough to accommodate variation in need and political choices. (See also W73-13480) (Woodard-USGS)
W73-13497

ECONOMIC CRITERIA FOR DECISIONS ON PRESERVATION AND USE OF INLAND WETLANDS IN MASSACHUSETTS,
Massachusetts Univ., Amherst. Dept. of Agricultural and Food Economics.
T. R. Gupta.
Journal of Northeastern Agricultural Economics Council, Vol 1, No 1, p 201-210, Summer 1972. 1 tab, 5 ref. OWRR B-023-MASS (4).

Descriptors: *Wetlands, *Conservation, *Land development, *Massachusetts, Reviews, Evaluation, Economics, Social aspects, Environmental effects, Ecology, Recreation, Wildlife conservation, Planning.

The criteria for decisions on preservation or development of inland wetlands in Massachusetts are evaluated. Wetlands may be considered productive habitats for wildlife with both commercial and aesthetic values, of visual cultural values, as buffers against floods, of materials possessing biological and educational values, and of water supply. The quantity and quality of these benefits will depend upon many factors, most important of which are the nature and location of a wetland itself. Contrarily, wetlands in their altered forms are capable of helping production of other economic goods and services such as food, other recreation, housing, commercial and industrial sites, and transportation facilities for which the human race continues to strive under the banner of economic development. In the context of these conflicting aspects of productivity, the necessity of choice among the social values of preserved versus altered use of wetlands exists. The approach here is to examine all potential benefits and costs of preserving wetlands in order to come up with criteria for optimum decisions. (Woodard-USGS)

PRELIMINARY STUDY OF POTENTIAL SITES FOR WATER-SUPPLY RESERVOIRS IN WEST AND SOUTHEAST ALABAMA,
Geological Survey of Alabama, University.
L. B. Peirce, J. R. Clark, and W. E. Smith.

vailable from NTIS, Springfield, Va 22151 PB-6 997 Price $3.00 printed copy; $1.45 microfiche. abama Development Office, Montgomery Spe-l Studies Division Planning Report, September 72. 119 p, 2 fig, 1 tab, 11 ref.

escriptors: *Reservoir sites, Water resources velopment, *Water demand, *Potential water pply, *Reservoir storage, *Alabama, Watershed nagement, Water utilization, Planning, Design teria, Projections, River basin development, nicipal water, Industrial water, Recreation, Ir-ation, Navigation, Water quality control, Flood ntrol.

ojections to the year 2020 indicate that the de-nd for water in Alabama could be 7 billion gal-s per day greater than in 1970. Much of this ad-ional water can be made available through more ensive use of groundwater supplies and the ther development of the major rivers, but a sub-ntial part must come from storage reservoirs nstructed on many of the presently undeveloped nor streams. Forty-four potential reservoir sites identified on minor streams in Alabama, exclu-e of the Alabama and the Tennessee River ins. Each site is described with regard to loca-n and various topographic, hydrologic, and logic characteristics pertinent to preliminary ervoir planning and design. Construction of ervoirs at the sites catalogued would provide an regate storage capacity of 3,750,000 acre-feet would add about 200,000 acres to the State's ter surface. The reservoirs would provide a tained yield of about 3.5 billion gallons per day t could be used for municipal, industrial, or icultural water supply or to augment stream-w for navigation or water-quality control. In ad-on, the reservoirs would offer valuable benefits recreation, fish and wildlife conservation, and ome cases flood control. (Woodard-USGS)

E IMPACT OF WATER RESOURCES ON E LOCATION OF ECONOMIC ACTIVITIES,
hnische Hochschule, Munich (West Germany).
M. J. Beckmann.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 691-695, (1972). 1 fig, 2 ref.

Descriptors: *Water resources, *Economics, Water users, Labor, Energy, Marketing.
Identifiers: *Location theory, *Economic activities.

Water is discussed as an input into production and as a consumption good. It is also discussed in relation to the economic theory of the location of activities, where certain basic principles are set forth that guide the efficient location of economic activities which underly the corrective forces of competitive markets. There can be no doubt that water plays an important role in determining locational choices. It tends, however, to be overshowed by other influences. Thus, water is indispensable as a cooling agent in energy production from fuel resources. But thermal energy production is definitely oriented towards fuel locations including locations to which fuel can be brought cheaply by sea or waterway. (See also W73-13134) (Bell-Cornell)

GEOTHERMAL ENERGY--RESOURCES, PRODUCTION, STIMULATION.
Stanford Univ., Calif. Dept. of Civil Engineering.

Available from Stanford University Press, Stanford, Calif Price $17.50. Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, P. Kruger, and C. Otte, editors, Stanford, Calif, 1973. 360 p.

Descriptors: *Geothermal studies, *Electric power, *Electric power demand, *Thermal powerplants, Electric power production, Hydrogeology, Water resources development, Energy, Steam turbines, Wells.
Identifiers: *Geothermal power, *Power demand.

An assessment is given of the potential of geothermal energy in meeting the increasing energy demand within the United States during the next few decades and in conserving our fossil fuels. Worldwide status, principles of occurrence, resource potential, and exploration techniques of geothermal energy are reviewed. The discussion includes production, forms of utilization, environmental impact, and well stimulation by nuclear, chemical, and mechanical techniques. Geothermal energy will be used largely for the generation of electric power. The nation's geothermal energy resource is potentially vast, particularly the portion that may be tapped by deeper drilling. Most of the resources are of the liquid-dominated type, rather than the vapor-dominated type exemplified by the field at The Geysers, in California. Development of the technology for the vapor-turbine cycle will permit the development of liquid-dominated resources of intermediate-range temperatures (in excess of 300 deg F), and thus vastly increase available geothermal resources. Electric power produced from a geothermal field appears to be economically competitive with that from fossil-fuel stations. The environmental impact of geothermal power development is more acceptable than that of fossil- or nuclear-fuel power development. The United States could be producing at least 132,000 Mw of electric power from its geothermal resources in 1985. (See W73-13215 thru W73-13232) (Knapp-USGS)
W73-13214

INTRODUCTION: THE ENERGY OUTLOOK,
Union Oil Co. of California. Los Angeles.
C. Otte, and P. Kruger.
In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 1-13, 1973. 2 fig, 4 tab, 10 ref.

Descriptors: *Geothermal studies, *Electric power, *Electric power demand, *Thermal powerplants, Electric power production, Hydrogeology, Water resources development, Energy, Steam turbines, Wells.
Identifiers: *Geothermal power, *Power demand.

During the period 1971-85 energy consumption in the United States is forecast to grow at an average rate of 4.2% per year. Domestic supplies will grow at an average rate of 2.6% per year. By 1985 domestic supplies will satisfy only about 70% of U.S. consumption. In order to meet growing demands for pertroleum liquids, imports would have to increase more than fourfold by 1985. Potential gas demand would approximately double between 1970 and 1985. Dependence on imports would rise from 4% of gas supplies in 1970 to more than 28% in 1985. The supply of domestic coal, including exports, will increase from 590 million tons in 1970 to some 1,071 million tons in 1985. Coal reserves are ample and could support a faster growth rate in production. By 1985 nuclear energy will be supplying 48% of total electric power requirements. The remaining fuels--hydroelectric power, geothermal power, and crude oil from shale--will together contribute only 3% of energy requirements in 1985. Among the undeveloped sources of energy, a likely candidate for early development in large quantities is geothermal energy. An assessment is given of the potential of geothermal energy in meeting the increasing energy demand within the United States during the next few decades and in conserving our fossil fuels. W73-13215

WORLDWIDE STATUS OF GEOTHERMAL RESOURCES DEVELOPMENT,
California Div. of Mines and Geology, Sacramento.
J. B. Koenig.
In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 15-58, 1973. 4 fig, 4 tab.

Descriptors: *Geothermal studies, *Electric power, *Electric power demand, *Thermal powerplants, Electric power production, Hydrogeology, Water resources development, Energy, Stream turbines, Wells.
Identifiers: *Geothermal power, *Power demand.

A conservative projection of worldwide geothermal generating capacity by 1980 is on the order of 2,500 Mw, or three times present day capacity. Because world consumption of electricity during the 8-year period is likely to double, the geothermal power component of world output will remain at less than 1% of total generating capacity. High-enthalpy geothermal systems are known only in regions of youthful volcanism, crustal rifting, and recent mountain building. The major geothermal and volcanic belts are the circum-Pacific margin, island groups of the mid-Atlantic rift, the rift zones of east Africa and the adjacent Middle East, and the irregular belt of mountains and basins extending from the Mediterranean basin of Europe and north Africa across Asia to the Pacific. Lower-enthalpy fluids are far more abundant in volcanic zones and elsewhere, and may represent a greater reserve of useful energy by an order of magnitude or more. Significant areas of lower-enthalpy geothermal fluids include the Gulf Coast of the United States, an extensive region in western Siberia, and portions of central Europe just north of the Alps and the Carpathian Mountains. Geologically, these are subsiding sedimentary basins at the margins of folded mountain ranges. The distribution of geothermal resources on a worldwide scale is summarized, development

and exploration activities are reviewed, and the potential for development over the next decade is evaluated. (See also W73-13214) (Knapp-USGS)

ASSESSMENT OF U.S. GEOTHERMAL RESOURCES,
California Univ., Riverside. Inst. of Geophysics and Planetary Physics.
R. W. Rex, and D. J. Howell.
In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 59-67, 1973. 4 tab, 1 ref.

Descriptors: *Geothermal studies, *Electric power, *Electric power demand, *Thermal powerplants, Electric power production, Hydrogeology, Water resources development, Energy, Steam turbines, Wells.
Identifiers: *Geothermal power, *Power demand.

Geothermal energy is not only technically feasible but also practical and economical. Present plants utilize natural underground steam. Hot-water geothermal fields are now under test in the Imperial Valley of California and will be on line in a similar geological setting in northwestern Mexico in 1973. Thus, in the United States geothermal energy can be considered a competitively proved energy source. The western third of the United States, including Alaska and Hawaii, is the most richly endowed in accessible geothermal energy resources. Volcanic energy alone constitutes a reserve of energy which is probably adequate to meet U.S. electrical energy needs for several centuries. Geothermal energy should be capable of supplying a major portion of future U.S. electric-energy requirements. Its development would involve costs lower than those for competing energy systems. Several computer models were utilized to determine how sensitive the profitability and, therefore, the economic feasibility of developing the geothermal resource would be to variations in each cost element. Approximately 1,200 test cases were run for this analysis. The analysis covered the three types of geothermal reservoirs: vapor dominated, hot water, and hot, dry rock systems. Descriptors: *Geothermal studies, *Electric power, *Electric power demand, *Thermal powerplants, Electric power production, Hydrogeology, Water resources development, Energy, Steam turbines, Wells.
Identifiers: *Geothermal power, *Power demand

The objectives of geothermal resource exploration are to locate areas underlain by hot rock, to estimate their volume, temperature, and permeability; and to determine the nature of any producible fluids. Theoretically, this energy source can be tapped from any point on earth simply by drilling sufficiently deep holes, providing passage for some heat-transfer fluid, and extracting the heat. Practically speaking, this hot mass is much too deep to tap in many large areas of the world. Occasionally the source is so close as to be manifested by such surface phenomena as geysers and hot springs. Reservoir engineering involves assessment of the size and deliverability of the geothermal resource and planning for optimum development. Well-stimulation technology is concerned with improving the permeability of the formation, which is important in both production and reinjection. Hydrofracturing, acid treatments, thermal fracturing, and chemical- and nuclear-explosion fracturing should all be considered. Potential environmental effects that need to be examined are gaseous and particulate emissions, land modification, subsidence, seismic hazards, surface-water and groundwater pollution, biological effects, noise effects, and social effects. A research program should emphasize the development of (1) vapor-turbine power-generating systems, (2) improved exploration methods, (3) desalination methods for geothermal fluids, (4) cheaper methods for deep drilling into hot formations, and (5) better models of geothermal reservoirs. ntifiers: Water resources problem-research alyses, Research community.

e Minnesota Water Resources Research Center leveloping a long-range comprehensive plan for ter resources research in Minnesota involving deral, State and local agencies, private oranizations, University of Minnesota, State and vate Colleges, and others. An attempt is being de to formulate broad research guidelines and ograms for coordinating research efforts. During cal year 1974, the Center will place a heavy phasis on the analysis of important water oblems in Minnesota to determine defensible asiated research requirements, i.e., the research cessary to give a reasonable level of assurance the problems can be resolved in a cost-effece and timely fashion. A water resources oblem-research analysis workshop conference ogram will be developed. The objective of this Conference was to discuss matters associated with developing the water resources research plan, and to devise ways and means for completing the plan. The following subjects were discussed: water resources research community in Minnesota, water resources problems in Minnesota and associated research needs, and Federal Water Pollution Control Act amendments and associated research opportunities. (Walton-Minnesota)

ENVIRONMENTAL LEGISLATION: HOW IT AFFECTS FOSSIL-FUEL-FIRED POWER--GENERATING EQUIPMENT,
General Electric Co., Schenectady, N.Y.
N. R. Dibelius, and W. F. Marx.
Mechanical Engineering, Vol 95, No 3, p 76-80, March 1973. 3 tab.

Descriptors: *Environmental control, *Regulation, *Administrative agencies, *Standards, *Electric powerplants, Environmental engineering, Air pollution, Water pollution, Sound waves, Social aspects, Electric power production, Fossil fuels, Coals, Oil, Natural gas, Legal aspects, Federal government, State governments, Legislation, Water quality control.

A summary is presented of federal developments concerning air, water and noise pollution through November 1972. The Clean Air Act set up air-quality-control regions for the achievement of national ambient air standards. Many federally approved state regulation plans contain emission limitations applicable to all steam generators of more than 250 million Btu per hour heat input while some cover units as small as 1 million Btu per hour heat input and others cover gas turbines. These restrictions may affect the placement of power plants. Standards for particulate matter, sulfur dioxide, and nitrogen oxides emissions for gas-, oil-, and coal-fired power plants are presented. The recently enacted Water Pollution Control Act requires that power plants achieve, where possible, no discharge of pollutants. This affects the discharge of cooling water, boiler blowdown, and the use of certain cleaning techniques. Regulations under the Walsh-Healy Act and the Occupational Safety and Health Act govern the level of noise to which employees may be exposed over a period of time. A table indicates these levels. While each of these laws and regulations is important, they must be viewed as a whole to evaluate their effect on a given facility. (Jerome - Vanderbilt)

GROUNDWATER: FROM WINDMILLS TO COMPREHENSIVE PUBLIC MANAGEMENT,
Nebraska Univ., Lincoln. School of Law.
R. S. Harnsberger, J. C. Oeltjen, and R. J. Fischer.
Nebraska Law Review, Vol 52, No 2, p 179-292, 1973. OWRR B-007-NEB (3), 14-31-0001-3301.

Descriptors: *Groundwater, *Water management (Applied), *Planning, *Nebraska, Withdrawal, Legal aspects, Riparian rights, *Irrigation.

This article is the second of three analyzing legal aspects of water resources planning in Nebraska. (See W73-00475 and W73-13506). This article describes groundwater utilization in Nebraska and analyzes some of its major problems. Despite increasing conflict between users, subterranean withdrawals have never been managed other than by the individual decisions of thousands of farm irrigators and domestic, industrial and municipal users. This contrasts sharply with the comprehensive scheme regulating stream diversions since 1895 which will be the focus of the last study in this series.
W73-13505

RIGHTS TO NEBRASKA STREAMFLOWS: AN HISTORICAL OVERVIEW WITH RECOMMENDATIONS,
Nebraska Natural Resources Commission, Lincoln.
R. J. Fischer, R. S. Harnsberger, and J. C. Oeltjen.
Nebraska Law Review, Volume 52, No 3, p 313-376, 1973. OWRR B-007-NEB (4), 14-31-0001-3301.

Descriptors: *Water management (Applied), Planning, *Riparian rights, Appropriation, Streamflow, Legal aspects, *Nebraska, *Prior appropriation, *Irrigation.

This article is the third of three analyzing legal aspects of water resources planning in Nebraska. (See W73-00475 and W73-13504). The chief purposes are to: (1) describe the present system of riparianism in Nebraska and show how it creates uncertainty and confusion; (2) recount the philosophy of the early settlers leading to passage of the Irrigation and Appropriation Act of 1895, which remains the basic law governing water rights in natural watercourses; (3) depict the 1895 Act; and (4) propose several major modifications.

REACTIONS OF CANADA GEESE TO RESERVOIR IMPOUNDMENT ON THE SNAKE RIVER IN WASHINGTON,
Washington State Univ., Pullman. Dept. of Zoology.
L. W. Gibson, and I. O. Buss.
Northwest Science Vol 46, No 4, p 301-318, 1972. 5 fig, 3 tab, 30 ref. OWRR-A-054-WASH (1).

Descriptors: Ecology, Dams, *Geese (Wild), Ducks, *Waterfowl, Management, *Washington, *Canada goose, *Impoundments, Reservoirs.
Identifiers: *Snake River (Wash).

A difficult aspect of river-development evaluation is the effect of dams upon wildlife. Currently a vast network of moderately sized dams is being constructed in the Pacific Northwest. Many of these dams, such as those completed and being completed on the Snake River in southwest Washington, create profound changes in the ecology of the entire region. Unfortunately, the need for pre- and post-impoundment research on such areas is usually realized too late. Vast changes in ecosystems occur without meaningful studies being conducted. This report is the latest of a continuous series of waterfowl studies, primarily concerning the great basin Canada goose Branta canadensis moffitti, conducted prior to, during, and after completion of a series of dams on the Snake River. The three objectives of this study are: (1) to evaluate ecological changes and their effects on Canada goose nesting on the Snake River between Almota and Central Ferry, Washington, as dam construction inundated important breeding sites, (2) to study various aspects of goose behavior based partly on marked geese, and (3) to study the use of artificial nesting structures under pre- and post-impoundment conditions.

In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 197-215, 1973. 3 fig, 22 ref.

Descriptors: *Environmental effects, *Geothermal studies, *Electric power, *Electric power demand, *Thermal powerplants, Electric power production, Hydrogeology, Water resources development, Energy, Steam turbines, Wells, Thermal pollution, Water pollution sources.
Identifiers: *Geothermal power.

The geothermal plant is unique in that all of the steps in the fuel cycle are localized at the site of the power production facilities. In all other methods of power production, the environmental impact of the fuel cycle extends far beyond the bounds of the power generating plant. The chief impact from the use of geothermal power occurs during the period of development of the field and construction of the steam gathering lines and powerplants, but the impact is limited to the area of the field and poses nothing like the vast disruption of the landscape caused by mining the fuels for other thermal powerplants. During the productive lifetime of the geothermal field, which can extend over many decades, most of the source area can be used for other purposes. At Larderello, for example, where natural steam has been used to produce electricity for 60 years, farms, orchards, and vineyards cover much of the land surface. Natural steam does contain a small percentage of noncondensable gases that are vented to the air. But compared to the amounts dissipated by fossil fuel plants, these gases--mostly carbon dioxide but also nitrogen, hydrogen, methane, and hydrogen sulfide--are minor. Compared to the total gaseous release from all steps in the nuclear fuel cycle, the overall volume and toxicity of gases from the geothermal plant is, again, minor. (See also W73-13214) (Knapp-USGS)

Identifiers: *Environmental Program (1973).

A National Land Use Policy Act would authorize Federal assistance to encourage the States, in cooperation with local governments, to protect lands which are of critical environmental concern and to control major development, including airport and highway siting. Any state that fails to establish an acceptable land use program within three years from enactment would be subject to cumulative reductions of up to 21% of the funds allocated to the State under the Airport and Airway Development Act, the Federal-aid Highway Acts, including the Highway Trust Fund, and the Land and Water Conservation Fund. The major categories of the program are managing the Land, expanding farm production, controlling pollution, and protecting our natural heritage. (Knapp-USGS)

07. RESOURCES DATA

7A. Network Design

LOSS OF INFORMATION BY DISCRETIZING HYDROLOGIC SERIES,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
M. Dyhr-Nielson.
Doctoral dissertation, May 1972. 134 p, 26 fig, 11 tab, 56 ref, append. OWRR-A-009-COLO (1).

Descriptors: *Hydrology, *Data collections, *Evaluation, *Stochastic processs, *Estimating, Analytical techniques, Water resources development, Management, Mathematical models, Systems analysis.
Identifiers: *Information loss, *Discretization procedures, *Sampled data.

This study considers the use of discretized data as the basis for stochastic modeling of continuous hydrologic variables and processes. A procedure is presented for quantitative evaluation of the loss of information when parameters of continuous stochastic processes are estimated on the basis of discrete sampled data. Three discretization procedures are considered: (1) Discrete point sampling, where the process is sampled at periodic time intervals as a series of instantaneous values; (2) average sampling, where the process is sampled as a series of average values; and (3) quantization of the variable, where its values are pooled into class intervals. The decision theoretical concept of 'expected information loss,' based on a linear loss function, is used as the measure of information content. For each discretization procedure, general expressions for the expected information loss in estimating mean, variance and autocovariance are found as functions of the discretization interval, the length of the sampling period, and the mean, variance, and autocovariance of the continuous process. A streamflow series is analyzed to show the applicability and potential of the approach. Average sampling introduces significant losses of information due to the biasing effect inherent in the sampling procedure. With the exception of the mean, a sample of instantaneous values contains more information about the parameters investigated than a sample of average values, taken over the same sampling interval. ERRORS OF MEASUREMENT, PRECISION, ACCURACY AND THE STATISTICAL COMPARISON OF MEASURING INSTRUMENTS,
Army Ballistic Research Labs., Aberdeen Proving Ground, Md.
F. E. Grubbs.
Technometrics, Vol 15, No 1, p 53-66, February 1973. 2 tab, 8 ref.

Descriptors: *Instrumentation, *Measurement, *Statistical methods, Laboratory equipment, Research equipment, Methodology.
Identifiers: *Accuracy, *Precision, *Errors.

A very important and yet widely misunderstood concept or problem in science and technology is that of precision and accuracy of measurement. It is therefore necessary to define the terms precision and accuracy (or imprecision and inaccuracy) clearly and analytically if possible. Also, we need to establish and develop appropriate statistical tests of significance for these measures, since generally a relatively small number of measurements will be made or taken in most investigations. A discussion is given of some of the pertinent literature for estimating variances in errors of measurement, or the 'imprecisions' of measurement, when two or three instruments are used to take the same observations on a series of items or characteristics. Also, present techniques for comparing the imprecision of measurement of one instrument with that of a second instrument through the use of statistical tests of significance are reviewed, as well as procedures for detecting the significance of the difference in biases or levels of measurement of two instruments. Finally, methods are indicated of extending present theory to the case of three measuring instruments, for which rather sensitive statistical tests of significance are developed for dealing with the precision and accuracy problem. An example for the three instrument case is given to illustrate the suggested methodology of analysis. (Mortland-Battelle)

Identifiers: *On-board analysis, *Marine environment, *Silver/silver chloride electrode, *Electrochemical behavior, Ion selective electrodes, Shipboard measurements, Mechanical shock.

A rugged silver-silver chloride electrode has been developed and used successfully in a variety of field applications. The electrode housing is made of 2.54 cm o.d. clear acrylic plastic rod. The filling solution is 2.7 M potassium chloride saturated with silver chloride, and contact with the external medium is made through a porous ceramic rod. Results of laboratory and field tests measuring the response of the electrode to chemical, thermal, mechanical, and electrical disturbances are presented. The electrode has provided relaible service when subjected to severe mechanical abuse during both offshore and onshore use. (Holoman-Battelle)

IMPROVED WATER ANALYSIS KIT,
Franklin Inst. Research Labs., Philadelphia, Pa.
W. H. Collins.
Available from the National Technical Information Service as AD-756 952, $3.00 in paper copy, $1.45 microfiche. Report Nos LWL-CR-03B69, FIRL-F3222-02/03, December 1972. 20 p, 12 fig, append. Contract No DAAD05-72-C-0113.

Descriptors: *Water analysis, *Water quality, *Equipment, *On-site tests, *Testing procedures, *Instrumentation, *Water properties, On-site investigations, Physical properties, Chemical properties, On-site data collections, Chemical analysis, Hardness (Water), Alkalinity, Chlorides, Sulfates, Hydrogen ion concentration, Acidity, Flocculation, Turbidity, Methodology, Coagulation, Pollutant identification.
Identifiers: Chlorine residual, Chlorine demand.

An improved water test kit which is smaller in size and simpler to use and stock than Water Quality Control Set, FSN 6630 262 7288, Standard B has been developed for the Army Land Warfare Laboratory. The kit has a minimum of glassware, weights 4 1/2 pounds, measures 9 X 6 X 6 inches and used techniques completely different than former methods. Eliminated is the need of preparing reagents, performing titrations and other tedious measurements. Most of the tests are conducted by dipping a paper or plastic strip into the water sample and reading the height of a column or comparing the color obtained to a chart. No complicated calculations are required. Water samples can be examined for pH, acidity, alkalinity, chlorine residual, chlorine demand, chloride, sulfate, turbidity and coagulation characteristics. Each kit contains enough material to examine at least 50 water samples for each of the above characteristics before requiring refill. The simplicity of the kit allows personnel with little or no training to use it effectively. (Holoman-Battelle)

Commonwealth Scientific and Industrial Research Organization, Sydney (Australia).

Warner.
arterly Journal of the Royal Meteorological ciety, Vol 99, No 419, p 82-88, January 1973. 4 2 tab, 12 ref.

scriptors: *Atmospheric physics, *Boundary ers, *Convection, *Air temperature, *Air circuon, Meteorology, Maritime air masses, Wind ocity, Measurements, Evaluation, Aircraft, -water interfaces, Oceans, Mixing, Humidity.

sults are discussed of measurements of temature and humidity made from an aircraft in 61 s at heights of 30 to 550 meters over the open in conditions of active convection with mean d speeds between 4.5 and 9.5 M/S. The intensif the fluctuations of temperature and humidity lifferent conditions is examined and compared ther data. The scaled values of the fluctuations temperature and mixing ratio are consistent n the law appropriate to free convection for ed heights up to 2; at higher levels there is less dence for a change with height. While the vir- potential temperature fluctuations in terms of rdorff's temperature scale decreased ewhat with scaled height in terms of depth of convection layer, their magnitude at all heights uch greater than predicted. It is possible that mixing at the upper boundary is important in ermining the magnitude of the fluctuations in ual potential temperature right down to the sure. The spectra obeyed the -5/3 power law for ensionless frequencies in excess of about 0.3. ome-Vanderbilt)

Identifiers: Decomposition, Flocculation, *Manures, Microbial studies, *Nitrogen, Peptizing reactions, Phosphates, *Slurry, Urea, *Wheat yield.

The use of liquid spent-slurry gave higher wheat yield and more N uptake than sun-dried slurry. The depressing effect of sun-drying on available N in slurry was attributed to enhanced irreversibility of the flocculative and peptizing reactions of organic colloidal matter due to desiccation and thus increased resistance to subsequent microbial decomposition and mineralization of slurry N. The absorption of liquid slurry in organic absorbents like green leaf powder, dry leaf powder, and sawdust greatly enhanced its manurial value. Its absorption in inorganic absorbents like charcoal dust and ash did not increase wheat yield, but N uptake was somewhat higher than sun-dried slurry. Like ordinary farm compost, the composts prepared by composting liquid slurry with wheat straw and sorghum stover gave lower yield and low N uptake. The enrichment of slurry with urea and superphosphate gave a manure which has a higher manurial value than (NH4)2SO4 on equivalent N basis.--Copyright 1973, Biological Abstracts, Inc.

WATER RESOURCES DATA FOR TEXAS, 1972: PART 1, SURFACE WATER RECORDS.
Geological Survey, Austin, Tex. Water Resources Div.

Basic Data Report, 1973. 625 p. 1 fig, 3 ref.

Descriptors: *Hydrologic data, *Surface waters, *Texas, *Basic data collections, *Streamflow, Gaging stations, Flow rates, Low flow, Peak discharge, Reservoirs, Lakes, Water supply.

Surface-water records for the 1972 water year for Texas, including records of streamflow or reservoir storage at gaging stations, partial-record stations, and miscellaneous sites, are presented. Records for a few pertinent gaging stations in bordering States also are included. These data represent that portion of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in Texas. The tables of data include a description of the gaging station, and daily, monthly, and yearly discharges of the stream. The description of the station gives the location, drainage area, records available, type and history of gage, average discharge, extremes of discharge, and general remarks. For most gaging stations on lakes and reservoirs a description of the station and a monthly summary table of stage and contents are given. Data for partial-record stations include measurements at low-flow partial-record stations and annual maximum stage and discharge at crest-stage stations. (Woodard-USGS)

Research efforts in hydrology and hydraulic engineering have resulted in the development of many computer programs. Available programs in hydrology were reviewed with the aim of assisting in the application of these programs by potential users. The primary focus is upon programs which will be used for design purposes (as well as research), and programs based on well-known procedures which as a result have immediate application to design problems. Many of these programs are available for use by other agencies, organizations, and individuals. Problems associated with adapting programs to a given computer and with understanding the technical procedure on which the program was based are discussed. Numerous computer programs are described, most of which were run on a CDC 6600 digital computer. General conclusions are given, including suggestions to those who might make use of the types of computer programs included in the study. Finally, an annotated bibliography covering a variety of topics in hydrology for which computer programs are of interest, and a list of computer programs developed by various organizations are presented. PROBLEMS OF ANALYTICAL METHODS IN HYDROLOGIC DATA COLLECTIONS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
I. Rodriguez-Iturbe, E. H. Vanmarcke, and J. C. Schaake.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 451-472, (1972) 1 fig, 2 tab, 12 ref.

Descriptors: Hydrology, *Hydrologic data, *Data collections, *Analytical techniques, Estimation, Correlation analysis, Design, Costs, Optimization, Equations, Networks, Size, Time.
Identifiers: Multidimensional processes, Stationarity, Bayesian methods, Random sampling, Global, Local.

General techniques are discussed for evaluation of the accuracy of hydrologic data collection systems. Presented is a discussion of multidimensional correlation functions from a genetic point of view. Hydrologic data is generally insufficient to discriminate among several correlation functions which supposedly describe the process in space; nevertheless the sampling requirements for a fixed accuracy may significantly vary from one function to the other making advisable a study of the genetic characteristics of these correlation functions. A general framework is presented for the estimation of spatial averages over a certain area. It is shown that the variance of the average depends on the spatial correlation, the geometry and size of the sampling network and the size of the area considered. Quantitative examples are given for estimating the number of stations with different sampling geometries. The time dimension is then introduced into the previous scheme allowing a quantitative evaluation of the old problem of time-vs-space trade in hydrologic networks. The assumption of stationarity is discussed, finally. A much weaker assumption of 'stationary increments' seems sufficient for the spatial process, allowing hydrologists to deal with regions where there exists a linear drift in the mean value of the process. Descriptors: *Statistical methods, *Chemical ana ysis, Estimating, Kinetics, Mathematical models.
Identifiers: *Data interpretation, Multiespons data, Linear dependencies, Nonlinear model Multivariate analysis, Errors.

Unless special care is exercised in analyzing mul tiresponse data serious mistakes can be made Some problems associated with fitting mul tiresponse models are identified and discussed. I particular, three kinds of dependencies are con sidered: dependence among the errors, linear de pendencies among the expected values of th responses, and linear dependencies in the data Since ignoring such dependencies can lead to dif ficulties, a method is described for detecting an handling them. The concepts involved are illus trated with a chemical example. (Mortland-Ba telle)

serially correlated hydrologic time series (y)
may also be available from a longer time se-
(x), itself serially correlated and cross corre-
with (y). On the assumption that both series
lag one autoregressions, large-sample vari-
s for the autoregressive parameter are derived
the short series alone or from both series,
the relative information was investigated nu-
cally. When the two serial correlations are ap-
imately equal and the length of (x) is twice
of (y), the gain in precision is about 4% when
cross correlation is 0.2, about 15% when the
s correlation is 0.4, about 31% when the cross
elation is 0.6, and 49% when the cross correla-
is 0.8. The equations giving maximum
ihood (ML) estimates are examined, and a
ively simple numerical technique is developed
one particular case of some practical im-
ance. The modified Matalas estimates have
ler mean square error than ML estimates, and
estimates derived from both series have
ler mean square error than ML estimates
ved from the single series only. (Knapp-

MAP SHOWING RANGES IN PROBABLE MAXIMUM WELL YIELD FROM WATER-BEARING ROCKS IN THE SAN FRANCISCO BAY REGION, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
D. A. Webster.
Miscellaneous Field Studies Map MF-431, 1972. 1 sheet, 4 maps, 1 tab, 27 ref.

Descriptors: *Water yield, *Groundwater, *Hydrogeology, *California, *Maps, Transmissivity, Aquifer characteristics, Drawdown, Water table.
Identifiers: *San Francisco Bay region.

This map presents generalized information regarding the probable maximum yields of wells in the rocks of the San Francisco Bay region. It is intended to serve the needs of planners and other persons seeking general information on potential yields from water wells. Potential yield of wells is only one consideration in planning for water development. The history of land subsidence in the Santa Clara Valley resulting from overpumping and of bay-water intrusion of aquifers supplying wells in parts of Alameda and Contra Costa Counties, for instance, make evident the need to consider planned rates of pumping throughout areas of large well yields. (Knapp-USGS)
W73-13519

MAPS SHOWING AREAS IN THE SAN FRANCISCO BAY REGION WHERE NITRATE, BORON, AND DISSOLVED SOLIDS IN GROUND WATER MAY INFLUENCE LOCAL OR REGIONAL DEVELOPMENT,
Geological Survey, Washington, D.C.
D. A. Webster.
Miscellaneous Field Studies Map MF 432, 1972. 8 p, 5 maps, 34 ref.

Descriptors: *Water quality, *Groundwater, *California, Nitrates, Boron, Dissolved solids, Water resources development, *Maps.
Identifiers: *San Francisco Bay region.

Information is provided on the nitrate, boron, and dissolved-solids content of groundwater in the San Francisco Bay region. Places where nitrate in groundwater has exceeded 45 mg per liter, where boron has exceeded 1 mg per liter, and where dissolved solids have exceeded 2,000 mg per liter are shown on the maps by symbols. Areas where the maximum concentration of dissolved solids in groundwater generally has been less than 500 mg per liter, 500 to 1,000 mg per liter, and greater than 1,000 mg per liter, and areas for which readily available chemical quality data are lacking, are outlined. Changes in the specific conductance and approximate dissolved-solids content of groundwater at 66 wells are shown by graphs for 1960-70. (Knapp-USGS)

FLOOD OF MARCH 19-20, 1970, METROPOLITAN BIRMINGHAM AND JEFFERSON COUNTY, ALABAMA,
Geological Survey, University, Ala.
K. W. Causseaux.
Alabama Geological Survey Atlas Series 2, 12 sheets, 1971. 7 fig, 5 photo, 9 map.

Descriptors: *Floods, *Alabama, *Maps, *Flood stages, *Historic floods, Mapping, Water levels, Rainfall, Flood recurrence interval, Flood profiles.
Identifiers: *Flood maps, *Jefferson County (Ala).

A heavy rainstorm which included many intensive local bursts moved eastward across north-central Alabama during the morning of March 19, 1970. According to information gathered immediately after the storm, including reports from several long-time residents, it was the greatest storm in many years; in Jefferson County the highest stages of record occurred at most stream-gaging stations. Moderate to extensive flooding occurred across the State, but the greatest property damage was in Birmingham and Jefferson County. Hydrologic data collected by the U.S. Geological Survey in cooperation with the Geological Survey of Alabama during and immediately after the storm are presented. Information is shown on a series of maps depicting the extent of areas inundated by the flooded streams in metropolitan Birmingham, and the flood event is described in terms of rainfall, streamflow, and flood elevations. This report provides public agencies and private individuals with factual data for solving flood problems and planning effective utilization of land adjacent to streams. (Knapp-USGS)

HYDROLOGIC AND HYDRAULIC DESIGN UNDER UNCERTAINTIES,
Illinois Univ., Urbana. Dept. of Civil Engineering.
W. H. Tang, and B. C. Yen.
In: Proceedings (Vol. II), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972, p 868-882, (1972). 3 fig, 1 tab, 20 ref.

Descriptors: Hydrology, *Hydraulics, *Design, Engineering, *Projects, Methodology, Probability, Design flow, Equations, Pipes, Reliability, Model studies, Systems analysis, *Risks.
Identifiers: Risk level, Storm sewers, Precipitation rate.

Uncertainties arise in various aspects and phases of hydrologic and hydraulic design of engineering projects. Previously, only hydrologic uncertainties such as basic randomness in flood or rainfall frequencies has been considered. A practical model is proposed through which all sources of uncertainties associated with a hydraulic design, including design model reliability, insufficient data, material variability, as well as hydrologic randomness etc., can be systematically analyzed, combined, and incorporated into the evaluation of the overall risk of alternative designs. Formulation leading to the selection of a design for a specified risk level is developed. In this approach, the conventional measure of risk based on frequency analysis would constitute only a part of this overall risk. An example of storm sewer design is presented to illustrate in detail the proposed formulation. Based on the assessment of uncertainties, the precipitation rate and the errors in the simplified design model are the major sources of uncertainty. A risk-based sewer pipe design curve is developed for practical purpose. For a specified risk level of 1%, the required safety factor in the design flow is shown to be about 2.0. W73-13159

OPTIMAL DESIGN STRATEGY FOR SMALL FLOOD-CONTROL STRUCTURES,
Queen's Univ., Kingston (Ontario).
W. E. Watt, and K. C. Wilson.
In: Proceedings (Vol. II), International Symposium on Uncertainities in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 903-916, (1972), 3 fig, 4 ref.

Descriptors: *Flood control, *Structures, *Design, *Economic efficiency, *Optimization, Estimating, Costs, Equations, Mathematical models, Systems analysis, *Risks.
Identifiers: *Economic analysis.

An optimal design strategy for use on a regional basis for small flood-control structures is presented. When a large number of such small structures is to be built on independent drainage basins, the total expenditure may be very large, and it is of considerable advantage to investigate the optimization process on the basis of a regional aggregate. A mathematical model is presented which is extended in two stages. First, an optimum design strategy is obtained for the 'perfect knowledge' case, assuming that economic efficiency is the objective. This strategy leads to the determination of an optimum design return period, which is a function of the exponents of the two regional cost equations, the ratio between the cost of a typical damage event and the construction cost, the effective rate and other parameters. Second, a modified strategy is developed for the 'real world' case where the uncertainities in the various parameters combine to give an overall uncertainity in estimating the optimum. It is found that the penalty resulting from an underdesign caused by this uncertainity is greater than that for an equivalent overdesign, and hence the 'real world' optimum should be larger than the estimated 'perfect knowledge' value. This increase is related to the degree of uncertainty and expressed in the form of overdesign factors applicable to discharge and return period. (See also W73-13134) (Bell-Cornell)
W73-13161

CONVECTIVE INSTABILITY IN LIQUID POOLS HEATED FROM BELOW,
Washington Univ., Seattle. Dept. of Chemical Engineering.
H. J. Palmer, and J. C. Berg.
Journal of Fluid Mechanics, Vol 47, Part 4, p. 779-787, 1971. 5 fig, 2 tab, 9 ref.

Descriptors: *Heat transfer, *Convection, *Fluid mechanics, Buoyancy, Friction, Heat flow, Heat resistance, Stability, Laboratory tests, Temperature.
Identifiers: Convective instability, Thermistors.

The linear hydrodynamic stability analysis of liquid pools heated from below combining surface tension and buoyancy effects as presented by Nield (1964) is confirmed by experiment for a series of silicone oils. The experimental method is an adaptation of the Schmidt-Milverton technique, in which the stability limit is located by the change of slope in the plot of heat flux versus temperature drop across the liquid pool. (Oleszkiewicz-Vanderbilt)

THERMALLY-DRIVEN LINEAR VORTEX,
Florida State Univ., Tallahassee. Dept. of Mathematics.
S. Blumsack, and A. Barcilon.
Journal of Fluid Mechanics, Vol 48, Part 4, p. 801-814, 1971. 2 fig, 1 tab, 8 ref.

Descriptors: *Heat transfer, *Vortices, *Velocity, *Mathematical models, Temperature, Shear, Shear stress, Coriolis Force, Hydraulics, Hydrostatic pressure, Mathematical studies.
Identifiers: Ekman numbers, Rossby numbers, Multi-boundary-layer structure.

Steady axially symmetric small Rossby number flows in which the driving consists of prescribed axial heat sources have been investigated. By letting the velocity be proportional to the shear at the bottom surface, the effects of that boundary condition on the resulting flows were studied. A multi-boundary-layer structure is found in the core, surrounding the heat sources. That structure depends on the relative magnitudes of the aspect ratio, stratification parameter and Ekman number. (Oleszkiewicz-Vanderbilt)
W73-13443

UNBOUNDED STRATIFIED FLOW OVER A VERTICAL BARRIER,
Case Western Reserve Univ., Cleveland, Ohio. Div. of Fluid, Thermal and Aerospace Sciences.
G. S. Janowitz.
Journal of Fluid Mechanics, Vol 58, No 2, p. 375-388, 1973. 2 fig, 9 ref.

Descriptors: *Streams, *Stream flow, *Mathematical models, *Stratified flow, Fluid mechanics, Hydraulic engineering, Model studies, Equations, Hydrologic equations, Froude number, Barriers, Forecasting.

The horizontal, linearly stratified, non-diffusive, high Reynolds number flow of an unbounded fluid over a two-dimensional vertical barrier is studied for a range of internal Froude numbers under Oseen and Boussinesq approximations. For Froude numbers >0.47 the most prominent feature of the flow is the system of large amplitude lee waves located downstream of the barrier with crests tilted in an upstream direction. For Froude numbers between 0.47 and 0.6 the crests actually extend upstream of the barrier and appear as flows of alternating direction over the barrier. For Froude numbers between 0.47 and 0.5 reversed flows due to these waves actually extend far upstream. For Froude numbers <0.47 a blocking column upstream of the obstacle, as well as large amplitude lee waves, is present. For even smaller Froude numbers the amplitude of the lee-wave system diminishes but the blocking column remains. It is also shown that the steady-state solution obtained by Trustrum for the density and pressure field is drastically altered if a small viscosity is retained in the transient analysis. (Jerome-Vanderbilt)
W73-13459

MAINTENANCE OF GREAT SOUTH BAY AND PATCHOGUE RIVER, NEW YORK, NAVIGATION PROJECT (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, New York.

Available from NTIS, Springfield, Va. 22151 as EIS-NY-73-0071-F Price $3.00 printed copy; $1.45 microfiche. September 1972. 18 p.

Descriptors: *Dredging, *Waste disposal, *Environmental effects, *New York, Spoil banks.
Identifiers: *Environmental Impact Statements, *Great South Bay (NY), Patchogue River (NY).

Maintenance dredging of the existing Federal navigation project in Great South Bay and Patchogue River, New York, to its authorized project dimensions will be performed by contract dredge with spoiling in an existing upland disposal site. The improvement would permit the continuation of efficient and safe delivery by water of petroleum products and other commodities yielding economic benefits to the surrounding communities. Adverse environmental effects which cannot be avoided are: temporary increase in turbidity during the dredging process, which would have an impact on the water quality and shellfish resources of the area; and spoiling in the upland site, which would continue to alter the natural environmental habitat of the waterfowl inhabiting the Swan Creek area. (Knapp-USGS)
W73-13524

NEAR-SHORE RIPPLES: SOME HYDRAULIC RELATIONSHIPS,
Windsor Univ (Ontario) Dept of Geography
A. S. Trenhaile
Journal of Sedimentary Petrology, Vol 43, No 2, p 558-568, June 1973. 6 fig, 1 tab, 37 ref.

Descriptors: *Ripple marks, *Beaches, *Sedimentary structures, *Waves (Water), Hydraulic models, Wavelengths, Sedimentology, Surf, Regression analysis, Correlation analysis, Statistical methods.

Sand ripples in shallow water with small fetch were analyzed in a wave tank to investigate some aspects of the relationship between ripple geometry and hydraulic parameters. Power spectral analysis demonstrated that ripple height and wavelength increase with wave height and decrease with water depth, such that although random fluctuations are present, ripple geometry tends to increase towards the breaker point. Bed mounds tend to cause ripples to increase in size on the waveward side and decrease on the leeward side. Ripple velocity was the least well explained of the ripple parameters investigated, although velocity was shown to be related to water depth and wave height. (Knapp-USGS)

DESIGN OF CASINGS AND SCREENS FOR WATER PRODUCTION AND INJECTION WELLS,
Moss (Roscoe) Co., Los Angeles, Calif.
R. Moss, Jr.
Paper presented at American Petroleum Institute Pacific Coast District Second Biennial Symposium, Anaheim, California, Dec 1964, 25 p, 8 ref, 8 tab, 8 fig.

Descriptors: *Water wells, Injection wells, *Well screens, *Design criteria, Southwest U.S., Well casings, Corrosion.
Identifiers: *Cable tool drilling, *Rotary-hydraulic drilling, Cone of depression, Double wall casing.

One of the most important contributing factors to development of the semiarid Southwestern United States has been the exploitation of the region's vast underground reservoirs. Casing and screen practices applied to the two basic well designs employed in the area are discussed. Consideration is given to installation, operation, and economic criteria for both cable-tool and rotary-hydraulic methods of well construction. (Campbell-NWWA)

ntifiers: *Geothermal power, *Power demand, ysers geothermal field (Calif).

Pacific Gas and Electric Company has been aged for 15 years in the design, construction, operation of dry steam geothermal electric er generators at the Geysers, California. The t's eight turbine generator units produce a net ut of 290,000 kw. Two more 53,000-kw units scheduled to go into operation in 1973. And in , after a single unit rated at 106,000 kw goes service, the total net output of The Geysers er Plant will be 502,000 kw, making it the lar- geothermal power installation in the world. pressure-flow characteristics of the steam s vary, but in general the flowing wellhead ssures decrease with increased production s. Shut-in pressure on the wells is 450-500 psi; the steam has a constant enthalpy of 1,200- 5 Btu per lb. The most economic utilization of resource resulted with a turbine-inlet pressure 00 psig and an exhaust pressure of 4 inches Hg olute. The electric power output of the wells is bout its maximum under these turbine condi- s. At higher pressures, the increased energy lable from the steam is more than offset by the inished steam-production rates from the wells. he operating conditions selected, about 80% of turbine steam flow is evaporated in the cooling er. This means that the condensed exhaust n the turbine can be used as cooling tower eup water. Power production costs compare orably with fossil fuel steam-generating units. also W73-13214) (Knapp-USGS)

E VAPOR-TURBINE CYCLE FOR OTHERMAL POWER GENERATION,
. Anderson.
Geothermal Energy--Resources, Production, nulation; Proceedings of Special Symposium of erican Nuclear Society, June 19-20, 1972: Stan- , Calif, p 163-175, 1973. 7 fig, 8 ref.

criptors: *Electric power, *Thermal power- ts, *Turbines, Electric power production, thermal studies, Energy, Equipment, Efficien- , Water pollution control.
ntifiers: *Vapor turbines, Isobutane.

ew geothermal power process, the vapor tur- cycle, was developed to eliminate the disad- tages inherent in the methods involving use of m. In this process the hot water brought to the ace is passed through a heat exchanger, where ves up heat to boil and superheat a high density or. The vapor then expands through a turbine produce power and is recycled to the heat nanger. The practical and economic ad- tages of this process may be great enough to turn the vast potential of geothermal energy into reality. Isobutane has the most favorable overall economics for developing power from water of about 325F. One of the important advantages of vapor turbine plant is that lower condensing temperatures can be used than are economically possible with a steam turbine plant. Since water at full pressure retains its gases in solution, the gases can be returned to the ground without danger of atmospheric pollution. (See also W73-13214) (Knapp-USGS)

A. H. Ewing.
In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 217-222, 1973. 1 fig, 5 ref.

Descriptors: *Geothermal studies, *Electric power, *Electric power demand, *Thermal powerplants, Electric power production, Hydrogeology, Water resources development, Energy, Steam turbines, Wells.
Identifiers: *Geothermal power, *Well stimulation.

One of the important problems in the development of geothermal resources is the necessity for proving reserves sufficient to justify the expense of constructing a powerplant directly at the site of a reservoir. The potential investment in the powerplant may be large compared to the investment already made in the exploration phase. Increased well productivity promised by artificial stimulation may make such decisions easier. The main objectives of research on the development of geothermal resources are (1) the ability to utilize the resource however it manifests itself in nature, (2) the technology necessary for efficient extraction of energy from the resource, (3) the ability to predict the productivity and longevity of the resource, and (4) the ability to develop the resource in an environmentally tolerable manner. HEAT-TRANSFER AGENTS FOR HIGH-TEMPERATURE SYSTEMS,
General Electric Corporate Research and Development, Schenectady, N.Y.
J. R. Fried.
Chemical Engineering, Vol 80, No 12, p. 89-93, May 28, 1973. 10 fig, 2 tab, 33 ref.

Descriptors: *Heat exchangers, *Temperature, *Thermal conductivity, *Thermodynamic behavior, *Pumping, Electric power production, Industrial plants, Facilities, Heat transfer, Heat flow, Thermal properties, Physical properties, Conduction, Fluid dynamics, Gases, Instrumentation, Materials, Mechanical engineering.

In heat transfer processes with temperatures below 32 F and above about 35o0 F substitute heat transfer agents for water are sought. Selection of the proper heat transfer agent and design of the transfer system for processes between 350 and 1000 F are treated in detail. Vapor phase systems allow greater quantities of heat transfer per pound of medium while liquid phase systems are specified when temperature control is important. The primary concern in choosing a heat-transfer medium once the system phase has been chosen is to match the process temperature requirements with the temperature range of the fluids. Other considerations are inventory cost, toxicity and ecology, flammability, thermal stability, freezing point, corrosive and fouling characteristics and pumping costs. The composition, temperature range, physical properties and pumping cost comparisons of major commercial heat-transfer fluids are listed and discussed. Several different vapor phase and liquid phase systems are described and compared. Carbon steel is the recommended construction material for all parts of the heat-transfer system in all cases except for inorganic salts above 850 F, when stainless steels are suggested. NOMOGRAMS SIMPLIFY DESIGN OF STEAM CONDENSERS,
A. Zanker.
Power Engineering, Vol 75, No 5, p 52-55, May 1973. 3 fig, 1 tab.

Descriptors: *Steam, *Condensers, *Design data, *Cooling water, Mechanical engineering, Heat transfer, Condensation, Heat exchangers, Design, Design criteria, Data processing, Mathematics, Equations.

The basic factors and equations relating the quantity and temperatures of steam to be condensed, the temperatures of entering and leaving cooling waters, and the heat transfer rates through the tube walls are presented for designing surface steam condensers. Although the step by step solution of these relationships is laborious and requires frequent reference to tables, charts, or graphs, the three nomograms presented greatly simplify the procedure. The first nomogram presents heat transfer rate, tube characteristic factor, and the exponent for temperature calculation. The second nomogram determines the outlet water temperature. The third determines cooling water rate, total required tube surface area and the total length of the tubes. An example is given for use of these nomograms. (Jerome - Vanderbilt)

W. C. Day.
Available from NTIS, Springfield, Va 22151 a AD-754 534 Price $3.00 printed copy; $1.4 microfiche. Technical Report TR E-72-23, Februa ry 1972. 205 p, 185 fig, 41 tab, 43 ref.

Descriptors: *Explosives, *Explosions, *Rock ex cavation, *Hawaii, *Harbors, Seismic studies, En vironmental effects, Coastal engineering, Crater Seismic waves, Coral.

A portion of a planned small-boat harbor i Kawaihae Bay, Hawaii, was explosively ex cavated in a weak coral material. The charges wer emplaced approximately 36 ft deep in the cor reef which was overlain with a water layer averag ing approximately 6 ft in depth. Charges wer spaced 100 and 120 ft apart. An additional array o sixteen 1/2-ton charges was subsequently em placed and detonated to clear that portion of th channel. The detonations resulted in a channe varying in width from about 150 to 260 ft at minimum project water depth of 12 ft. Th berthing basin is almost a square area 400 ft on side at the 12-ft water depth contour. The explo sive craters were broad and shallow with no lip and were actually better suited to harbor excava tion than the less wide and deeper craters typica of dry land cratering detonations. The craterin mechanism appears to be one of densification o the coral through crushing and subsequent settling

sults of a wave measurement program, a study the effect of the detonations on the marine en-onment, a ground-motion measurement pro-m, a structures response study, an airblast mea-ement program, and a measurement program to ermine the peak pressure and the acceleration velocity of the water directly over the charge itions are also included. (Knapp-USGS)

COVERY OF GEOTHERMAL ENERGY OM HOT, DRY ROCK WITH NUCLEAR EX-OSIVES,
telle-Northwest, Richland, Wash. Geothermal grams.
. Burnham, and D. H. Stewart.
Geothermal Energy--Resources, Production, nulation; Proceedings of Special Symposium of erican Nuclear Society, June 19-20, 1972: Stan-l University Press, Stanford, Calif, p 223-230, 3. 5 fig, 1 tab, 6 ref.

scriptors: *Nuclear explosions, *Geothermal lies, *Electric power, Thermal powerplants, ter resources development.
ntifiers: *Project Plowshare, *Geothermal ver.

Plowshare geothermal concept entails the eration of power from the energy contained in osits of hot, dry rock. The rock is fractured by array of sequentially fired, fully contained lear explosives; when fracturing is complete, er is injected through fill pipes and steam is ndrawn to the surface facility. One cubic mile ock at 350C, when cooled to 150C, would yield sable energy equivalent to that of 300 million rels of oil--an amount, at present oil prices, th approximately $1 billion. ntifiers: *Geothermal power, *Well stimula-.

stimulation of geothermal fluid production n hydrothermal aquifers for producing steam generate electricity appears to be technically sible. Several methods of production are possi-to optimize the recovery of the heat stored in geothermal aquifer. Explosive stimulation is of the more promising methods. For surface avations with shallow depth burial, chemical losives have proved useful in yields of up to und 5 kt. In deeper formations, the emplace-nt of large volumes of explosives and the higher nation temperatures limit the practical explo-yield. Nuclear explosives, which become re efficient in size and cost for yields above ut 3 kt, have proved useful for large-volume turing of underground formations. Special lear explosives are being designed for use in p emplacement wells of diameters usually used the oil and gas industry. Methods for the op-um removal of geothermal fluids must be based a thorough knowledge of the recovery chanisms operating within the reservoir, includ-fluid expansion, liquid vaporization, and the segregation of liquid and vapor, as well as the influx of fluids from adjacent or underlying aquifers. The deposition and production of minerals must be considered, as well as the environmental effects due to the explosion and subsequent geothermal production. (See also W73-13214) (Knapp-USGS)
W73-13227

INDUCTION AND GROWTH OF FRACTURES IN HOT ROCK,
Los Alamos Scientific Lab., N. Mex.
M. Smith, R. Potter, D. Brown, and R. L. Aamodt.
In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 251-268, 1973. 8 fig, 1 tab, 16 ref.

Descriptors: *Geothermal studies, *Electric power, *Electric power demand, *Thermal powerplants, Electric power production, Hydrogeology, Water resources development, Energy, Steam turbines, Wells.
Identifiers: *Geothermal power, *Well stimulation, *Hydraulic fracturing.

Widespread use of geothermal energy will be facilitated if a way can be found to produce it from hot, relatievely dry rock by circulating a fluid introduced from the surface through the rock and bringing the heated fluid (probably water) back to the surface. Some concepts of how this might be done are discussed. Hydraulic fracturing is begun by pumping water from the surface into a borehole. When the borehole becomes sufficiently pressurized, a tensile crack will form somewhere along its margin. The fracture will grow as the pumping continues, and will continue to grow as long as water can be pumped in fast enough to exceed the leakage taken off by the permeability of the rock. Thermal stresses will create new cracks, preferentially near the source of the first one, where the water is coldest, and these cracks may also propagate under the high pressure exerted at that point. At the present state of the drilling art, it would probably not be practical to drill holes deeper than about 20,000 ft. (See also W73-13214) (Knapp-USGS)
W73-13228

CHEMICAL EXPLOSIVE STIMULATION OF GEOTHERMAL WELLS,
Naval Weapons Center, China Lake, Calif. Research Dept.
C. F. Austin, and G. W. Leonard.
In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 269-292, 1973. 14 fig, 14 ref.

Descriptors: *Geothermal studies, *Explosives, *Water wells, Wells, Injection wells, Electric power, Thermal powerplants, Hydrogeology, Water resources development.
Identifiers: *Geothermal power, *Well stimulation.

Explosive stimulation of geothermal wells appears to be feasible with today's technology. Blasting in a bore hole can increase the flow rates into the hole. The increase is accomplished by destruction of grain-to-grain bonding, by destruction of physical blockages of fractures and pores, or by the creation of entirely new fractures. The use of explosive charges to increase the effective diameter of a well through fracture propagation or to enhance the nearby porosity has the advantages that the equipment required is minimal, little weight need be handled, and little or no junk is likely to remain in the hole. To be successful, the explosive stimulation of a geothermal well requires the careful understanding and matching of three major factors: (1) the method of explosive energy delivery; (2) the type of host rock; and (3) the fluid phase in the formation. (See also W73-13214) (Knapp-USGS)
W73-13229

ENVIRONMENTAL ASPECTS OF NUCLEAR STIMULATION,
Utah Univ., Salt Lake City. Dept. of Mechanical Engineering.
G. M. Sandquist, and G. A. Whan.
In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 293-313, 1973. 5 fig, 2 tab, 30 ref.

Descriptors: *Environmental effects, *Nuclear explosions, *Wells, *Geothermal studies, Thermal powerplants, Water pollution sources, Radioactive wastes, Seismic studies.
Identifiers: *Well stimulation, *Geothermal power.

Because the development of geothermal energy resources is attractive from environmental and economic standpoints, the utilization of nuclear explosives to stimulate latent geothermal sites merits examination. However, the contained underground detonation of one or more nuclear devices raises considerable questions and problems that demand critical evaluation. Deep dry-rock stimulation seems at this time to favor the use of very large (200- to 1,000-kt) explosives, which would produce severe environmental impact from seismic effects. Geothermal aquifer stimulation would make use of smaller nuclear devices, but because of the probable affinity to tectonic plate boundaries of the geologic formations addressed by this application, the potential environmental impact of radioactive contamination would be a serious concern, as would possible induced seismic fault movement. The excellent safety record of the Plowshare Program is reassuring. There have been no personal injuries, only minor damage to structures, and minimal impact on the environment attributable specifically to the detonations. (See also W73-13214) (Knapp-USGS)

CORROSION AND SCALING IN NUCLEAR--STIMULATED GEOTHERMAL POWER PLANTS,
California Univ., Livermore. Lawrence Livermore Lab.
O. H. Krikorian.
In: Geothermal Energy--Resources, Production, Stimulation; Proceedings of Special Symposium of American Nuclear Society, June 19-20, 1972: Stanford University Press, Stanford, Calif, p 315-334, 1973. 1 fig, 5 tab, 22 ref.

Descriptors: *Environmental effects, *Nuclear explosions, *Wells, *Geothermal studies, *Corrosion, *Scaling, Thermal powerplants, Water pollution sources, Radioactive wastes, Seismic studies.
Identifiers: *Well stimulation, *Geothermal power.

The experience gained with corrosion and scaling in natural geothermal powerplants makes it apparent that similar problems are likely to be encountered with nuclear stimulation. These problems can be explored more fully by performing exposure tests on alloy coupons in geothermal steam and water under the proposed nuclear application conditions. It is important in such tests that the compositions of the steam and the water be representative of the particular geothermal formation. Steam taken directly from a nuclear well would be most desirable; or, lacking an actual well, it may be possible to infer the impurities to be expected in the steam from analyses of core samples from the formation. It seems likely, as has been the case for natural geothermal wells, that suitable alloys and other construction materials for turbine systems can be found through such screening tests. MARICULTURE COMES OF AGE,
H. S. Gordon.
Chemical Engineering, Vol 79, No 17, p. 26-28, August 7, 1972. 1 fig.

Descriptors: *Aquiculture, *Marine fisheries, *Research and development, *Heated water, Marine biology, Chemistry, Marine animals, Shrimp, Oysters, Lobsters, Salmon, Shellfish farming, Economics, Model studies, Experimental farms, Prototypes, Technology, Utilities, Thermal powerplants, Reproduction, Effluents, Cycles, Growth rates, Sewage, Algae.

Current state of development of and future possibilities are reviewed for the controlled cultivation of seafood stocks-mariculture. Experiments which are underway examine the possibilities for controlled environment hatcheries which would optimize the reproduction and maturation cycles of shrimp, oysters, lobsters and salmon. Experiments for salmon cultivation have shown signs of success, but the prime interest of U.S. companies centers on shrimp. Several large corporations have made investigations of shrimp production and Texas A and M University in cooperation with Central Power and Light Company of Texas is planning studies to determine the effects of high local salinity on shrimp growth and development, the effects of salinity on shrimp under different feeding conditions, and the feasibility of shrimp production on a 1,150 acre man-made cooling lake. Utilities have been investigating the possibility of mariculture in their thermal effluents. Sewage may prove useful for algae farms, which would provide food for mariculture projects. Some technical problems involved in mariculture are the reconditioning of hatchery water, the prevention of disease and the development of equipment resistant to salt water corrosion. (Jerome-Vanderbilt)

TESTS OF VARIATIONS OF THE ABERNATHY SALMON DIET, 1970,
Bureau of Sport Fisheries and Wildlife, Longview, Wash. Salmon-Cultural Lab.
L. G. Fowler, J. L. Banks, and J. W. Elliott.
U S Bur Sport Fish Wildl Tech Pap, 61, p 3-13, 1972, Illus.
Identifiers: *Abernathy salmon, Germ, Oncorhynchus-tshawytscha, *Salmon diet, Tests, Wheat, Feeding trials.

The 1970 fall chinook salmon (Oncorhynchus tshawytscha) feeding trials indicated that dry pelleted diets were equal to moist pelleted diets with similar formulations. A superior diet was produced by reducing the ratio of dried whey product and wheat germ meal to 1:1 and eliminating cottonseed meal. This formulation fed at a 45% protein level was more efficient than other protein levels fed. Growth was not reduced when the soybean oil supplement was lowered from 6% to 2% of the diet. Two corn distillers' products that were substituted as partial replacements for dried whey product did not enhance fish growth. Storage of the Abernathy dry pellet at room temperature did not alter the nutritional adequacy of the diet.--Copyright 1973, Biological Abstracts, Inc.

ANNUAL REPORT. 1971-1972. NEW JERSEY WATER RESOURCES RESEARCH INSTITUTE.
Rutgers - The State Univ., New Brunswick, N.J. Water Resources Research Inst.

August 1972. 94 p, 4 fig, 118 ref. OWRR A-999-NJ (9).

Descriptors: *New Jersey, *Research, *Projects, Water pollution control, Hydrology, Hydraulics, Estuaries, Biological oxygen demand, Salinity, Water quality, Environmental effects, Oysters, Sites, Development, Waste discharge, *Water resources Institute.
Identifiers: *Delaware Estuary.

Research progress and prospects are summarized for 1971-1972. Projects concerning hydrology and hydraulics, environmental impacts of man's activities, stream oxygenation and BOD, othe pollution and biological problems, and institutional and political studies are discussed. Specific topics that deal with estuaries include: the effects of salinity and other water quality parameters on N.J. oyster beds; evaluation of estuarine site development lagoons; the Delaware estuary system; spatially and temporally distributed discharge of effluents in estuaries; and atmospheric aeration in an estuary. (Ensign-PAI)

ensity/Shape/Size Equilibria in the Marine
d Coastal Dune Sands of the Apalachicola,
orida, Region,
W73-13540 2L

BEAUFORT SEA
Warm Water Advection in the Southern Beaufort Sea August-September 1971,
W73-13466 2E

BED LOAD
Experiment in Determining Total Sediment Discharge (Suspended Load and Bed Load) (Opyt vychisleniya polnogo raskhoda nanosov (vzveshennykh i vlekomykh)),
W73-13049 2J

Ostler Lenses: Possible Environmental Indicators in Fluvial Gravels and Conglomerates,
W73-13539 2J

BELGIUM (MOULIN POND)
The Flora and Vegetation of Pond-Banks in the Southern Part of the Entre-Sambre-Et-Meuse,
W73-13615 2I

BENEFITS
Estimating Benefits to Improved Seasonal Water Supply Forecasts: A Case Study of Irrigation Benefits,
W73-13143 3F

BENTGRASS ROOTS
Effect of Temperatures and Water Table Depth on the Growth of Creeping Bentgrass Roots,
W73-13105 2I

BENTHIC FAUNA
Benthic Macroinvertebrate Community Structure in a Great Plains Stream Receiving Feedlot Runoff,
W73-13180 5C

BENTHIC ORGANISMS
Nature of the Bottom and Distribution of Benthic Organisms in the Bol Region (Eastern Archipelago of Lake Chad),
W73-13618 2H

BENTHOS
Determination of Optimal Multiple Uses of a Small Water Resource,
W73-13009 6A

Measurements of Microalgal Primary Production (Phytoplankton and Microbenthos) in the Smalandshavet (Denmark),
W73-13612 5C

BERSEEM
Studies on Sodium Water for Irrigation. Effect of Addition of Cations: K, Ca or Mg,
W73-13192 3C

BIBLIOGRAPHIES
Nitrification and Denitrification - A Selected Bibliography,
W73-13085 5B

Literature Pertaining to Water Quality and Quantity in Unsaturated Porous Media,
W73-13302 5B

Aquatic, Bioenvironmental Studies in the Columbia River at Hanford 1945-1971. A Bibliography with Abstracts,
W73-13409 5B

Radioactive Waste Management - A Bibliography of Publicly Available Literature Pertaining to the USAEC's Hanford, Washington Production Site.
W73-13414 5B

Selected Irrigation Return Flow Quality Abstracts 1970-1971, Second Annual Issue,
W73-13472 5G

Thermal Effects on Aquatic Organisms, Annotated Bibliography of 1971 Literature,
W73-13478 5C

BICARBONATES
Complexes Affecting the Solubility of Calcium Carbonate in Water,
W73-13004 2H

BIOACCUMULATION
Cadmium Toxicity and Accumulation in Southern Naiad,
W73-13251 5C

Uptake and Accumulation of DDT and PCB by Ephemera Danica (Ephemeroptera) in Continuous-Flow Systems,
W73-13265 5C

BIOASSAY
Inorganic Nitrogen Removal From Wastewater: Effect on Phytoplankton Growth in Coastal Marine Waters,
W73-13179 5C

Epoxidation and Fate of (C-14)Aldrin in Insecticide-Resistant and Susceptible Populations of Mosquitofish (Gambusia affinis),
W73-13190 5B

Cadmium Toxicity and Accumulation in Southern Naiad,
W73-13251 5C

Residue Determination of Ethylenethiourea (2-Imidazolidinethione) From Tomato Foliage, Soil, and Water,
W73-13259 5A

Eighteenth Annual Conference on Bioassay, Environmental and Analytical Chemistry, Oct. 10-11, 1972, Program and Abstracts.
W73-13415 5A

BIOASSAYS
The Control of pH and Total Alkalinity or Total Carbonate in Aquatic Bioassays,
W73-13111 5C

BIOCHEMICAL OXYGEN DEMAND
Activated Sludge Modifications for Enhancement of Trickling Filter Plant Performance. I. Design, Operation, and BOD Removal in the Units. II. Nitrification,
W73-13086 5D

Process for the Reduction of the Biochemical Oxygen Demand of Sewage, and for the Recovery of the Inherent Protein,
W73-13334 5D

BIOINDICATORS
Coliforms, Fecal Coliforms, and Fecal Streptococci as Indicators of Water Pollution,
W73-13262 5B

Methodology for the Identification of a Biological Indicator in Radioecology: Example of CS137 and a Freshwater Mollusc Anodonta, (Methodologie Pour La Recherche D'un Indicateur Biologique En Radioecologie),
W73-13407 5A

Occurrence of SE75 and SN113 in Oysters,
W73-13424 5A

BIOLOGICAL COMMUNITIES
Hydrocarbons in the Pelagic Sargassum Community,
W73-13172 5B

SOND Cruise 1965: Factor and Cluster Analyses of the Plankton Results, A General Summary,
W73-13507 5A

Establishment of Invertebrate Communities on Log Substrates in the Kaskaskia River, Illinois,
W73-13508 5C

BIOLOGICAL INDICATORS
The Effect of Temperature on the Number of Circulating Hemocytes in the California Sea Hare, Aplysia California,
W73-13461 5C

BIOLOGICAL SAMPLES
Kinetic Microdetermination of Mercury in Natural Waters and Biological Materials,
W73-13271 5A

Mercury Residues in Fish, 1969-1970 - National Pesticide Monitoring Program,
W73-13514 5A

BIOLOGICAL SYSTEMS
Structure and Properties of Water and Their Significance for Biological Systems, (In Czech),
W73-13392 2I

BIOLOGICAL TREATMENT
Uptake of Mercury by Yeast Cells,
W73-13030 5D

Process Design Manual for Upgrading Existing Wastewater Treatment Plants.
W73-13132 5D

Process for Treating Septic Biological Wastes in Arctic Climates,
W73-13332 5D

BIORHYTHMS
Energy Flow in a Woodland Stream Ecosystem: II. The Taxonomic Composition and Phenology of the Chironomidae as Determined by the Collection of Pupal Exuviae,
W73-13509 5C

BIOTOPES
Studies of Landscape Ecology of the Natural Protection Area 'Entenfang' Near Wesseling,
W73-13388 2I

BLOWDOWN
Treatment of Radioactive Steam-Generator Blowdown,
W73-13447 5D

BLUEGILL SUNFISH
Thermal Effects on Eggs, Larvae and Juveniles of Bluegill Sunfish,
W73-13020 5C

BOD5
Comparison of Pollution Degree of Fluvial Waters Evaluated by Means of the BOD5 Test and a Saprobiological Method,
W73-13622 5B

BOILER FEED WATER
Water Treatment for Heating and Process Steam Boilers,
W73-13462 5F

Requisites for Non-Polluting Microbicides,
W73-13476 5D

BOILER FEEDWATER
Water Treatment for High Pressure Boilers,
W73-13440 3F

BOILERS
Water Treatment for High Pressure Boilers,
W73-13440 3F

Magnetic Treatment of Water.
W73-13544 5F

BOILING WATER REACTOR
Final Environmental Statement Related to the Continuation of Construction of Unit 2 and the Operation of Units 1 and 2 Millstone Nuclear Power Station.
W73-13411 5C

BOILING WATER REACTORS
Final Environmental Statement Related to the Construction of Susquehanna Steam Electric Station Units 1 and 2.
W73-13412 5C

Final Environmental Statement Related to Construction of Nine Mile Point Nuclear Station Unit 2.
W73-13413 5C

BORDER IRRIGATION
Note on the Infiltration Advance Front from Border Irrigation,
W73-13371 2G

BOREHOLE CAMERAS
Underground Surveys with Borehold Cameras,
W73-13566 4B

BOREHOLE STUDIES
A Periscope for the Study of Borehole Walls, and its Use in Ground-Water Studies in Niagara County, New York,
W73-13555 4B

BOREHOLES
Measurement of Groundwater Flow Using an In-Situ Thermal Probe,
W73-13013 2F

A Periscope for the Study of Borehole Walls, and its Use in Ground-Water Studies in Niagara County, New York,
W73-13555 4B

BOTTOM SEDIMENTS
Variations in Grain Size of Bottom Sediments in Lowland and Mountain Streams (Izmenchivost' krupnosti donnykh otlozheniy ravninnykh i gornykh rek),
W73-13051 2J

Postdepositional Osmotic Adjustments in Sediments from Soap Lake, Washington,
W73-13064 2J

Geothermal Mercury Pollution in New Zealand,
W73-13175 5B

A Vibratory Coring System for Continental Margin Sediments,
W73-13532 2J

Oceanic Sediments and Their Diagenesis: Some Examples From Deep-Sea Drilling,
W73-13542 2J

New Jersey Continental Shelf Near Bottom Current Meter Records and Recent Sediment Activity,
W73-13543 2J

BOUNDARY LAYERS
Spectra of the Temperature and Humidity Fluctuations in the Marine Boundary Layer,
W73-13455 7B

BOWLING GREEN (KY)
Pollution of Karst Aquifers,
W73-13203 5B

BRACKISH WATER
Application of a Sulfate-Sensitive Electrode to Natural Waters,
W73-13276 5A

BRANDYWINE PROJECT
Environmental Protection Through Public and Private Development Controls.
W73-13025 5G

BRAZILIAN COASTAL DUNES
Deformational Structures in Brazilian Coastal Dunes,
W73-13123 2J

BRINE DISPOSAL
Preliminary Report on the Disposal of Oil-Field Brines in the Ritz-Canton Oil Field, McPherson County, Kansas,
W73-13564 5G

BRINES
Geothermal Power Still Iffy,
W73-13433 3E

BROOK TROUT
Gonad Maturation of Brook Trout (Salvelinus fontinalis) in a High Mountain Lake under a Modified Photoperiod,
W73-13128 2H

BROWARD COUNTY (FLA)
Water Resources of Broward County, Florida,
W73-13209 2A

BROWN CHERNOZEM
Salinity and Drainage in a Brown Chernozem Irrigated at Different Minimum Moisture Contents,
W73-13109 3C

BROWN TROUT
Geothermal Mercury Pollution in New Zealand,
W73-13175 5B

BUBBLE FRACTIONATION
Solute Separation by Continuous Bubble Fractionation,
W73-13638 5D

Continuous Bubble Fractionation: Part I, Theoretical Consideration,
W73-13639 5D

Continuous Bubble Fractionation: Part II, Effects of Bubble Size and Gas Rate,
W73-13640 5D

Continuous Bubble Fractionation: Part III, Experimental Evaluation of Flow Parameters,
W73-13641 5D

BUBBLE SIZE
Continuous Bubble Fractionation: Part II, Effects of Bubble Size and Gas Rate,
W73-13640 5D

BUFFERS
Evidence for Buffering of Dissolved Silicon in Fresh Waters,
W73-13238 5B

BULLHEADS
Change in Feeding and Body Condition of Brown Bullheads Overwintering in the Heated Effluent of a Power Plant,
W73-13430 5C

E TOOL DRILLING
gn of Casings and Screens for Water luction and Injection Wells,
-13568 8B

ISFLIES
ogy of Two Related Species of Caddis Fly rae in the Organic Substrates of a dland Stream,
-13286 5B

IUM
ration of Manganese, Iron, Cobalt, Nickel, per, Zinc and Cadmium by Reversed-Phase matography Using Tri-N-Octylamine as Stationary Phase and Applying a Gradient on Technique, (Extraktionschromatographische Trennung Von Mangan, Eisen, Kobalt, el, Kupfer, Zink Und Cadmium Unter vendung Von Tri-n-Octylamin Als Stare Phase Und Gradientelution),
-13234 5A

nium Toxicity and Accumulation in hern Naiad,
-13251 5C

AREOUS SOILS
genic Calcite Accumulation in Arid and arid Regions of the Indo-Gangetic Alluvial of Erst-While Punjab (India)--Their phology and Origin,
-13311 2G

Map Showing Ranges in Probable Maximum Well Yield from Water-Bearing Rocks in the San Francisco Bay Region, California,
W73-13519 7C

Maps Showing Areas in the San Francisco Bay Region where Nitrate, Boron, and Dissolved Solids in Ground Water May Influence Local or Regional Development,
W73-13520 7C

Ground Water Development and Management in the Owens Valley,
W73-13569 4B

CANADA
The Geographic Distribution of Freshwater Hirudinoidea in Canada,
W73-13170 5B

Mercury Contamination of Fish in Northwestern Ontario,
W73-13287 5C

CANADA GOOSE
Reactions of Canada Geese to Reservoir Impoundment on the Snake River in Washington,
W73-13082 6G

CANADA (OTTAWA)
Ecological Effects of Snowmobiles,
W73-13113 4C

CARBAMATE PESTICIDES
Mass Spectrometric Determination of Diethyldithiocarbamates,
W73-13241 5A

CARBOHYDRATES
Effect of Plant Moisture Stress on Carbohydrate and Nitrogen Content of Big Sagebrush,
W73-13309 2I

CARBON
Precise Shipboard Determination of Dissolved Nitrogen, Oxygen, Argon, and Total Inorganic Carbon by Gas Chromatography,
W73-13255 5A

Relationship Between the Carbon Isotope Composition of Soil CO2 and Dissolved Carbonate Species in Groundwater,
W73-13360 2K

CARBON ADSORPTION
Evaluation and Development of Physical-Chemical Techniques for the Separation of Emulsified Oil from Water,
W73-13642 5D

CARBON DIOXIDE
A New Method for Determining the Total Carbonate Ion Concentration in Saline Waters,
W73-13063 2K

Differential Stomatal Response Between C3 and C4 Species to Atmospheric CO2 Concentration and Light,
W73-13398 2D

Model of the Accumulation of Fossil CO2 in the Atmosphere and the Sea,
W73-13403 5B

CARBON ISOTOPES
Relationship Between the Carbon Isotope Composition of Soil CO2 and Dissolved Carbonate Species in Groundwater,
W73-13360 2K

CARBON PASTE ELECTRODES
Ion-Selective Carbon-Paste Electrodes for Halides and Silver (I) Ions,
W73-13187 5A

CARBON RADIOISOTOPES
Model of the Accumulation of Fossil CO2 in the Atmosphere and the Sea,
W73-13403 5B

CARBON REGENERATION
Process Design Manual for Carbon Adsorption.
W73-13131 5D

CARBONATE ANALYSIS
A New Method for Determining the Total Carbonate Ion Concentration in Saline Waters,
W73-13063 2K

CARBONATES
Complexes Affecting the Solubility of Calcium Carbonate in Water,
W73-13004 2H

A New Method for Determining the Total Carbonate Ion Concentration in Saline Waters,
W73-13063 2K

The Control of pH and Total Alkalinity or Total Carbonate in Aquatic Bioassays,
W73-13111 5C

CARBOXYMETHYLOXYSUCCINATE
Colorimetric Assay for Carboxymethyloxysuccinate, A New Detergent Builder,
W73-13637 5A

CARIBBEAN SEA
Chlorinated Hydrocarbons in Plankton from the Gulf of Mexico and Northern Caribbean,
W73-13273 5B

CARP
A New Nematode Species in Carp Waters of the West Regions of Ukraine,
W73-13624 5C

Sanguinicolosis in Carp in the Winter,
W73-13625 5C

CATFISHES
Acute Effects of Administration of Methyl Mercuric Chloride on Tissues and Enzyme Activity in Channel Catfish (Ictalurus punctatus),
W73-13029 5C

CATION EXCHANGE
Fixing Cation Interaction with Blister-Like Osmotic Swelling on Vermiculite Cleavages,
W73-13425 2G

CATIONS
A Potassium-Selective Silicone-Rubber Membrane Electrode Based on a Neutral Carrier,
W73-13185 5A

Ion-Selective Carbon-Paste Electrodes for Halides and Silver (I) Ions,
W73-13187 5A

Chelometric Titrations of Metal Cations Using the Tungsten Bronze Electrode,
W73-13278 5A

CATTLE
Effects on Cattle of Water Containing Detergents,
W73-13602 5C

CENTRAL ATLANTIC COASTAL ZONE
Environmental Application of Remote Sensing Methods to Coastal Zone Land Use and Marine Resource Mnagement,
W73-13210 2L

CERATOPHYLLUM
The Kinetics of NH4 Uptake by Ceratophyllum,
W73-13504 5C

CERCARIAE
Ecological Observations on the Emergence of Cercariae from Goniobasis Floridensis Reeve From the Wekiva River, Fla.,
W73-13103 5C

CESIUM RADIOIOSOTOPES
W73-13416 5B

CESIUM RADIOISOTOPES
Distribution of CS137 in Soils and Vegetation on the Island of Puerto Rico,
W73-13423 5B

CHAD (KANEM)
Seasonal Variations in the Rotifer Population of the Natron Containing Waters of Kanem (Chad),
W73-13467 2H

CHAETOGNATHS
SOND Cruise 1965: Factor and Cluster Analyses of the Plankton Results, A General Summary,
W73-13507 5A

CHAPEL HILL (N.C.)
Variations in Characteristics of Wastewater Influent at the Mason Farm Wastewater Treatment Plant, Chapel Hill, North Carolina,
W73-13087 5D

CHARCOAL REACTIVATION
Study of Gamma Induced Low Temperature Oxidation of Textile Effluehnts,
W73-13022 5D

CHEATGRASS
Methods for Seeding Three Perennial Wheatgrasses on Cheatgrass Ranges in Southern Idaho,
W73-13319 4A

CHELATION
The Determination of Molybdenum in Sea Water by Hot Graphite Atomic Absorption Spectrometry After Concentration on p-Aminobenzylcellulose or Chitosan,
W73-13199 5A

Analytical Applications of Polyamine-Polyurea Chelating Resins,
W73-13571 5A

Solubility of Manganese in the Presence of Soil Chemicals,
W73-13645 5B

CHEMICAL ANALYSIS
A New Method for Determining the Total Carbonate Ion Concentration in Saline Waters,
W73-13063 2K

Enzymatic NH3-N Determination: A Specific Method for the Determination of Ammonia in Water and Sediments,
W73-13068 5A

Hydrocarbons in the Pelagic Sargassum Community,
W73-13172 5B

Some Problems Associated with the Analysis of Multiresponse Data,
W73-13195 7C

Some Procedures for Isolating Toxic Metabolites of Phosphorothionate Pesticides from Animal Tissues and Fluids,
W73-13196 5A

Potentiometric Studies on Thioacetamide by Means of a Sulphide Ion-Selective Membrane Electrode,
W73-13197 5A

The Determination of Molybdenum in Sea Water by Hot Graphite Atomic Absorption Spectrometry After Concentration on p-Aminobenzylcellulose or Chitosan,
W73-13199 5A

Quality of Surface Waters of the United States, 1968: Part II. Pacific Slope Basins in California.
W73-13200 2K

Precise Shipboard Determination of Dissolved Nitrogen, Oxygen, Argon, and Total Inorganic Carbon by Gas Chromatography,
W73-13255 5A

Atomic Absorption Spectrometry of Traces of Tri- and Hexavalent Chromium,
W73-13275 5A

Collaborative Study of the Nonaqueous Copper Colorimetric and Silver Titrimetric Methods for the Determination of Malathion in Technical Grade Malathion and in Malathion Formulation,
W73-13283 5A

Chemical Composition of Ocean Using a Direct Measuring Oceanographic Electrochemical Probe,
W73-13294 2K

CHEMICAL COMPOSITION
Fatty Acid Compositions of Paracolons: Arizona, Citrobacter, and Providencia,
W73-13252 5C

The Determination of All Detectable Elements in the Aquatic Plants of Linsley Pond and Cedar Lake (North Bradford, Connecticut) By X-Ray Emission and Optical Emission Spectroscopy,
W73-13261 5A

CHEMICAL CONTAINER LEAKS
Feasibility of Plastic Foam Plugs for Sealing Leaking Chemical Containers,
W73-13019 5G

CHEMICAL INTEFERENCE
Application of a Sulfate-Sensitive Electrode to Natural Waters,
W73-13276 5A

CHEMICAL INTERFERENCE
Iron Spectral Interference in the Determination of Zinc by Atomic Absorption Spectrometry,
W73-13277 5A

Determination of Traces of Thallium in Urine by Anodic Stripping AC Voltammetry,
W73-13279 5A

CHEMICAL IONIZATION MASS SPECTROMETRY
Determination of Nitrogen-15 by Chemical Ionization Mass Spectrometry,
W73-13280 5A

CHEMICAL OXYGEN DEMAND
Study of Gamma Induced Low Tempera
Oxidation of Textile Effluehnts,
W73-13022

CHEMICAL PRECIPITATION
Process Design Manual for Phosph
Removal,
W73-13129

Treatment of Complex Cyanide for Reus
Disposal,
W73-13468

CHEMICAL REACTIONS
Factors Controlling Copper (II) Concentrat
in the Keweenaw Waterway,
W73-13010

Apparatus for the Purification of Waste Wa
W73-13328

CHEMICAL STUDIES
A Chemical Approach to the Problem of
vironmental Contamination,
W73-13586

CHEMICAL TREATMENT
Process for the Reduction of the Biochem
Oxygen Demand of Sewage, and for
Recovery of the Inherent Protein,
W73-13334

CHEMOSTAT
Apparatus for Semi-Continuous Culture
Daphnia,
W73-13239

CHINOOK SALMON
Effect of Thermal Shock on Vulnerabilit
Predation in Juvenile Salmonids. II. A I
Response by Rainbow Trout to Three Sl
Temperatures,
W73-13291

CHIRONOMIDAE
Study of the Biology of Pelopia punctipe
Mg. (Chironomidae, Diptera) in the Mingec
Reservoir (In Russian),
W73-13621

CHLORIDES
A Simple Coulometric Method for the D
mination of Chloride in Natural Water,
W73-13181

CHLORINATED HYDROCARBON PESTICI
Electron Capture Gas Chromatographic An
sis of DDA: Utilization of 2-Chloroeth
Derivative,
W73-13176

Gas-Liquid Chromatographic Separation
Sulfur from Chlorinated Pesticide Residue
Wastewater Samples,
W73-13263

An Isolation and Cleanup Procedure for
Levels of Organochlorine Pesticide Residu
Fats and Oils,
W73-13284

Comparative Extraction of Chlorin
Hydrocarbon Insecticides from Soils 20 Y
after Treatment,
W73-13285

CHLORINATION
Treatment of Complex Cyanide for Reus
Disposal,
W73-13468

Treatment of Glue Factory Wastes by Physiocochemical Processes,
W73-13647 5D

HLORINE PLANTS
Mercury Contamination of Fish in Northwestern Ontario,
W73-13287 5C

HLOROPHYLL
Chlorophyll Content and Primary Production of Sessile Algal Community in Mountain Stream Chigonozawa Running Close to Kiso Biological Station of the Kyoto University,
W73-13614 5C

HLOROPHYTA
The Influence of Environmental Factors on the Distribution of Freshwater Algae: An Experimental Study. I. Introduction and the Influence of Calcium Concentration,
W73-13546 5C

IOABORUS
Sulfur Budget of Lake Shelbyville, Illinois, and the Effects of Sulfides Upon Chaoborus,
W73-13005 5B

IROMAGRAPHY
Separation of Manganese, Iron, Cobalt, Nickel, Copper, Zinc and Cadmium by Reversed-Phase Chromatography Using Tri-N-Octylamine as the Stationary Phase and Applying a Gradient Elution Technique, (Extraktionschromatographische Trennung Von Mangan, Eisen, Kobalt, Nickel, Kupfer, Zink Und Cadmium Unter Verwendung Von Tri-n-Octylamin Als Stationare Phase Und Gradientelution),
W73-13234 5A

IROMATOGRAPHY
Some Procedures for Isolating Toxic Metabolites of Phosphorothionate Pesticides from Animal Tissues and Fluids,
W73-13196 5A

IROMIUM
Atomic Absorption Spectrometry of Traces of Tri- and Hexavalent Chromium,
W73-13275 5A

IROMOGENIC REAGENTS
A New Chromogenic Reagent for the Detection of Phenolic Compounds on Thin-Layer Plates,
W73-13169 5A

IRYSOPHYTA
The Influence of Environmental Factors on the Distribution of Freshwater Algae: An Experimental Study. I. Introduction and the Influence of Calcium Concentration,
W73-13546 5C

Freshwater Diatoms in Thailand,
W73-13570 5A

LIATED PROTOZOA
The Vertical Distribution of Some Ciliated Protozoa in the Plankton of a Eutrophic Pond During Summer Stratification,
W73-13101 5C

LIATES
Tidal Marsh Ciliates (Protozoa): Morphology, Ecology, Systematics,
W73-13591 2H

TROBACTER FREUNDII
Fatty Acid Compositions of Paracolons: Arizona, Citrobacter, and Providencia,
W73-13252 5C

CITY PLANNING
Attitudes, Values, and Perceptions in Water Resource Decision-making Within a Metropolitan Area,
W73-13008 6B

Methodology for Assessment of Urban Water Planning Objectives,
W73-13017 3D

A Procedure for Assessing Water Resources for Urban Planning,
W73-13035 6A

CLASSIFICATION
Taxonomic Guides to Arctic Zooplankton (V): Pelagic Polychaetes of the Central Arctic Basin,
W73-13233 5A

CLAY MINERALS
Fixing Cation Interaction with Blister-Like Osmotic Swelling on Vermiculite Cleavages,
W73-13425 2G

CLAY SOILS
Effect of the Rate of Application and the Volume of Applied Water on the Rate of Mobility of Certain Insecticides in Clay Soil,
W73-13579 5B

CLAYS
One-Dimensional Consolidation of a Clay Layer with Impeded Drainage Boundaries,
W73-13368 2G

Comparison Between Compressibilities of Sands and Clays,
W73-13534 2G

CLEANING
Preoperational Cleaning of High Pressure Steam Systems,
W73-13444 3E

CLEANUP
An Isolation and Cleanup Procedure for Low Levels of Organochlorine Pesticide Residues in Fats and Oils,
W73-13284 5A

CLIMATIC UNCERTAINTY
Climatic Uncertainty Effects on Management and Design of Reservoir-Irrigation Systems,
W73-13137 3F

CLIMATOLOGY
Upper Mississippi River Comprehensive Basin Study, Appendix C--Climatology and Meteorology.
W73-13483 6B

CLOGGING
Clogging in Simulated Glacial Aquifers Due to Artificial Recharge,
W73-13374 4B

CLONORCHIS-SINENSIS
Epidemiological Study on Clonorchis Sinensis Around Lake Biwa, Shiga Prefecture: II. Survey on Metacercaria Infection in Freshwater Fishes and on Human Infection with This Parasite, (In Japanese),
W73-13112 5C

CLOSED WATER BODIES
Concerning the Calculation of Level Veriation of Cutoff Water Balance,
W73-13163 4A

CLOUD COVER
Cloudiness as a Global Climatic Feedback Mechanism: The Effects on the Radiation Balance and Surface Temperature of Variations in Cloudiness,
W73-13441 2B

CLOVER
Compeittion Between Grass and Clover for Phosphate: II. Effect of Root Activity, Efficiency of Response to Phosphate, and Soil Moisture,
W73-13097 3F

COAGULATION
Process Design Manual for Phosphorus Removal,
W73-13129 5D

Treatment of Glue Factory Wastes by Physiocochemical Processes,
W73-13647 5D

COASTAL AQUIFERS
Hydraulic Sand-Model Study of the Cyclic Flow of Salt Water in a Coastal Aquifer,
W73-13558 2L

COASTAL ENGINEERING
Ecological Effects of Offshore Dredging and Beach Nourishment: A Review,
W73-13290 5C

COASTS
The Coastal Zone as an Integral Element of Water-Resource Systems,
W73-13036 2L

COBALT
The New Method for the Determination of Cobalt in Sea Water by Solvent Extraction with 2-Nitroso-5-Diethylaminophenol,
W73-13183 5A

Separation of Manganese, Iron, Cobalt, Nickel, Copper, Zinc and Cadmium by Reversed-Phase Chromatography Using Tri-N-Octylamine as the Stationary Phase and Applying a Gradient Elution Technique, (Extraktionschromatographische Trennung Von Mangan, Eisen, Kobalt, Nickel, Kupfer, Zink Und Cadmium Unter Verwendung Von Tri-n-Octylamin Als Stationare Phase Und Gradientelution),
W73-13234 5A

Dietary Intake of Cobalt by the Adult Population of Tarapur,
W73-13426 5B

COBALT IRRADIATION
Potential for the Use of Cobalt-60 Irradiation in the Treatment of Waste Waters,
W73-13401 5D

COBALT RADIOISOTOPES
Potential for the Use of Cobalt-60 Irradiation in the Treatment of Waste Waters,
W73-13401 5D

Dietary Intake of Cobalt by the Adult Population of Tarapur,
W73-13426 5B

COD (FISH)
Residues of DDT in Cod from Norwegian Fjords,
W73-13249 5A

COLD RESISTANCE
Low-Temperature Acclimation and the Seasonal Temperature Sensitivity of some Tropical Marine Fish,
W73-13453 5C

COLIFORMS
Fatty Acid Compositions of Paracolons: Arizona, Citrobacter, and Providencia,
W73-13252 5C

Coliforms, Fecal Coliforms, and Fecal Streptococci as Indicators of Water Pollution,
W73-13262 5B

COLLABORATIVE STUDIES
Collaborative Study of the Nonaqueous Copper Colorimetric and Silver Titrimetric Methods for the Determination of Malathion in Technical Grade Malathion and in Malathion Formulation,
W73-13283 5A

COLLOIDS
Size Classes of Organic Carbon in Seawater,
W73-13062 5B

Electrophoretic Evaluation and Process Control,
W73-13547 5F

COLOMBIA (SANTA MARTA)
Studies on the Temperature and Water Balance of Chosen Plant Species of the Dry Area of Santa Marta (Colombia), (In Spanish),
W73-13385 2D

COLONIZATION
Establishment of Invertebrate Communities on Log Substrates in the Kaskaskia River, Illinois,
W73-13508 5C

COLOR REACTIONS
A New Chromogenic Reagent for the Detection of Phenolic Compounds on Thin-Layer Plates,
W73-13169 5A

COLOR REMOVAL
Study of Gamma Induced Low Temperature Oxidation of Textile Effluehnts,
W73-13022 5D

COLORADO
Data Acquisition Systems in Water Quality Management,
W73-13024 5G

A Decade of Judicial Developments and Changes in Colorado Water Law: 1960-1970,
W73-13070 6E

Salt Pickup from Agricultural Lands in the Grand Valley of Colorado,
W73-13202 5B

COLORADO RIVER
Salt Pickup from Agricultural Lands in the Grand Valley of Colorado,
W73-13202 5B

COLORADO RIVER BASIN
Irrigation Management for Control of Quality of Irrigation Return Flow,
W73-13469 5G

COLORADO (ST. VRAIN RIVER)
Productivity and Distribution of Trichoptera Larvae in a Colorado Mountain Stream,
W73-13124 2I

COLUMBIA RIVER
Radionuclide Decline in Columbia River Water.
W73-13345 5B

Aquatic, Bioenvironmental Studies in the Columbia River at Hanford 1945-1971. A Bibliography with Abstracts,
W73-13409 5B

Radioactive Waste Management - A Bibliography of Publicly Available Literature Pertaining to the USAEC's Hanford, Washington Production Site.
W73-13414 5B

COLUMN PACKING
Gas-Liquid Chromatographic Separation of Sulfur from Chlorinated Pesticide Residues in Wastewater Samples,
W73-13263 5A

COMBINED TREATMENT
Surface Adsorption: A Promising Approach for the Treatment of Tannery Effluents,
W73-13648 5D

COMMUNITY DEVELOPMENT
Environmental Protection Through Public and Private Development Controls,
W73-13025 5G

COMPARATIVE TESTS
Micromethod System for Identification of Anaerobic Bacteria,
W73-13242 5A

Collaborative Study of the Nonaqueous Copper Colorimetric and Silver Titrimetric Methods for the Determination of Malathion in Technical Grade Malathion and in Malathion Formulation,
W73-13283 5A

COMPREHENSIVE PLANNING
Proceedings of Conference on Toward a Water Resources Research Plan for Minnesota.
W73-13303 6E

Final Environmental Statement Related to Operation of Surry Power Station Unit 1.
W73-13408 5C

Final Environmental Statement Related to the St. Lucie Plant Unit No. 1.
W73-13410 5C

Final Environmental Statement Related to the Continuation of Construction of Unit 2 and the Operation of Units 1 and 2 Millstone Nuclear Power Station.
W73-13411 5C

Final Environmental Statement Related to the Construction of Susquehanna Steam Electric Station Units 1 and 2.
W73-13412 5C

Final Environmental Statement Related to Construction of Nine Mile Point Nuclear Station Unit 2.
W73-13413 5C

The President's 1973 Environmental Program.
W73-13528 6G

COMPRESSIBILITY
Comparison Between Compressibilities of Sands and Clays,
W73-13534 2G

COMPRESSIBILITY (TRIAXIAL)
Comparison Between Compressibilities of Sands and Clays,
W73-13534 2G

COMPRESSIBILITY (UNIAXIAL)
Comparison Between Compressibilities of Sands and Clays,
W73-13534 2G

COMPUTER MODELS
HYDRA: Dynamic Model for Urban Hydrologic Systems,
W73-13012 4A

Simulation of Coupled Leaky Aquifers and Surface-Water System,
W73-13014 2A

Decision Making in Water Resource Allocation,
W73-13301 6B

COMPUTER PROGRAMS
Determination of Optimal Multiple Uses of a Small Water Resource,
W73-13009 6A

HYDRA: Dynamic Model for Urban Hydrologic Systems,
W73-13012 4A

A Minimum Cost Water Distribution Network,
W73-13071 4A

Design of Optimal Water Distribution Networks Using Dynamic Programming,
W73-13072 4A

An Interactive Design System for Water Distribution Networks,
W73-13073 4A

Computer Programs in Hydrology,
W73-13076 7C

Developments in Applications of Remote Sensing to Hydrologic Modeling,
W73-13146 2E

Dynamic Cooling.
W73-13449 5E

CONCRETE ADDITIVES
Effect of Calcium Lignosulfonate on Properties of Concrete at Early Ages,
W73-13644 5D

CONDENSATION
Apparatus for Distillation of Fluids,
W73-13322 3A

Process and System for Extracting Salts, Concentrated Brine, and/or Pure Water From Saline Water,
W73-13323 3A

Contribution to the Study of the Condensation of Organic Compounds During Humus Formation in a Podzolic Environment (In French),
W73-13627 2I

CONDENSERS
Temperature Profiles in Condensers,
W73-13445 3E

Effect of Noncondensables in Sea Water Evaporators,
W73-13463 3E

Nomograms Simplify Design of Steam Condensers,
W73-13464 8C

NDUCTANCE
Estimating Water Quality from Electrical Logs,
W73-13556 4B

NFERENCES
roceedings of Conference on Toward a Water esources Research Plan for Minnesota.
/73-13303 6E

NNATE WATER
Sediment Squeezer for Removal of Pore Vaters Without Air Contact,
/73-13531 2J

NNECTICUT
he Determination of All Detectable Elements the Aquatic Plants of Linsley Pond and edar Lake (North Bradford, Connecticut) By -Ray Emission and Optical Emission Spec-oscopy,
73-13261 5A

NNECTICUT RIVER
ttitudes, Values, and Perceptions in Water esource Decision-making Within a etropolitan Area,
73-13008 6B

NSERVATION
rocess for the Reduction of the Biochemical xygen Demand of Sewage, and for the ecovery of the Inherent Protein,
73-13334 5D

conomic Criteria for Decisions on Preserva-on and Use of Inland Wetlands in Mas-chusetts,
73-13518 6B

NSOLIDATION
ne-Dimensional Consolidation of a Clay ayer with Impeded Drainage Boundaries,
73-13368 2G

NSTRAINTS
ne Linear Decision Rule in Reservoir Manage-ent and Design, 3, Direct Capacity Deter-nation and Intraseason Constraints,
73-13138 4A

NSUMPTIVE USE
airie Sandreed (Calamovilfa longifolia): ater Infiltration and Use,
73-13312 2I

NTINENTAL SHELF
Vibratory Coring System for Continental argin Sediments,
73-13532 2J

ew Jersey Continental Shelf Near Bottom rrent Meter Records and Recent Sediment tivity,
73-13543 2J

scription and Use of an Underwater Televi-on System on the Atlantic Continental Shelf,
73-13559 7B

NTROL SYSTEMS
ocess Design Manual for Upgrading Existing astewater Treatment Plants.
73-13132 5D

NVECTION
fect of Solute Dispersion on Thermal Con-ntion in a Porous Medium Layer,
73-13381 2F

nvective Instability in Liquid Pools Heated om Below,
73-13442 8B

Spectra of the Temperature and Humidity Fluctuations in the Marine Boundary Layer,
W73-13455 7B

COOLING
Temperature Profiles in Condensers,
W73-13445 3E

Dry Cooling Tower Uses Steel Structure,
W73-13451 5D

Problems with Exchangers in Ethylene Plants,
W73-13465 8G

COOLING TOWERS
Estimating Cooling Tower Costs from Operating Data,
W73-13432 5D

Dry Cooling Tower Uses Steel Structure,
W73-13451 5D

Simplified Method for Determining Tower Drift Rate,
W73-13457 5B

COOLING WATER
Nomograms Simplify Design of Steam Condensers,
W73-13464 8C

Requisites for Non-Polluting Microbicides,
W73-13476 5D

COOTS
Leptomitus lacteus (Phycomycetes, Oomycetales, Saprolegniaceae) as Food for Coot (Fulica atra) at Artificial Pond of Danube Near Oepfingen, (In German),
W73-13387 5G

COPEPODS
The Effect of Temperature on the Development Rate of the Major Life Stages of Diaptomus Pallidus Herrick,
W73-13456 5C

SOND Cruise 1965: Factor and Cluster Analyses of the Plankton Results, A General Summary,
W73-13507 5A

COPPER
Factors Controlling Copper (II) Concentrations in the Keweenaw Waterway,
W73-13010 5B

Effects of Copper on the Locomotor Orientation of Fish,
W73-13021 5C

Separation of Manganese, Iron, Cobalt, Nickel, Copper, Zinc and Cadmium by Reversed-Phase Chromatography Using Tri-N-Octylamine as the Stationary Phase and Applying a Gradient Elution Technique, (Extraktionschromatographische Trennung Von Mangan, Eisen, Kobalt, Nickel, Kupfer, Zink Und Cadmium Unter Verwendung Von Tri-n-Octylamin Als Stationare Phase Und Gradientelution),
W73-13234 5A

Copper Accumulation in Soils Used for Hop Growing in Bavaria, (In German),
W73-13395 5B

CORE DRILL (VIBRATORY)
A Vibratory Coring System for Continental Margin Sediments,
W73-13532 2J

CORE DRILLING
A Vibratory Coring System for Continental Margin Sediments,
W73-13532 2J

Dual String Drilling Method Yields Improved Samples,
W73-13565 8C

Core Orientation,
W73-13567 8C

CORE ORIENTATION
Core Orientation,
W73-13567 8C

CORE SPLITTER
A Splitter for Unconsolidated Cores Taken in Plastic Liners,
W73-13535 2J

CORES
Distribution and Background Levels of Mercury in Sediment Cores From Selected Wisconsin Lakes,
W73-13264 5B

A Vibratory Coring System for Continental Margin Sediments,
W73-13532 2J

A Splitter for Unconsolidated Cores Taken in Plastic Liners,
W73-13535 2J

CORN
Losses of Atrazine in Runoff Water and Soil Sediment,
W73-13102 5B

CORRELATION ANALYSIS
Use of Cross Correlation Between Hydrological Time Series to Improve Estimates of Lag One Autoregressive Parameters,
W73-13364 7C

CORROSION
Corrosion and Scaling in Nuclear-Stimulated Geothermal Power Plants,
W73-13231 8H

Water Treatment for High Pressure Boilers,
W73-13440 3F

CORROSION CONTROL
Water Treatment for Heating and Process Steam Boilers,
W73-13462 5F

Problems with Exchangers in Ethylene Plants,
W73-13465 8G

COST ANALYSIS
Estimating Cooling Tower Costs from Operating Data,
W73-13432 5D

COST COMPARISONS
A Comparison of Consumer's Surplus and Monopoly Revenue Estimates of Recreational Value for Two Utah Waterfowl Marshes,
W73-13018 6B

COST-EFFECTIVENESS
Treatment of Some of the Uncertainties Encountered in the Conduct of Hydrologic Cost-Effectiveness Evaluations,
W73-13154 6B

COST ESTIMATES
Process Design Manual for Suspended Solids Removal.
W73-13130 5D

COST MINIMIZATION
A Minimum Cost Water Distribution Network,
W73-13071 4A

COSTS
Treatment of Some of the Uncertainties Encountered in the Conduct of Hydrologic Cost-Effectiveness Evaluations,
W73-13154 6B

COULOMETRY
A Simple Coulometric Method for the Determination of Chloride in Natural Water,
W73-13181 5A

CRAYFISH
Utilization of the Crayfish Orconectes Limosus as Forage by White Perch (Morone Americana) in a Maine Lake,
W73-13106 2H

CROP PRODUCTION
Upper Mississippi River Comprehensive Basin Study, Appendix N--Agriculture.
W73-13494 6B

CROSS CORRELATION
Use of Cross Correlation Between Hydrological Time Series to Improve Estimates of Lag One Autoregressive Parameters,
W73-13364 7C

CRUSTACEANS
Taxonomic Guides to Arctic Zooplankton (VI): Appendicularians of the Central Arctic, Mysids of the Arctic Ocean and Confluent Seas, Field Guide to Arctic Zooplanktonic Crustaceans Ostracods of the Central Arctic,
W73-13300 5A

CRUSTED SOILS
A Numerical and Similarity Analysis of Infiltration Into Crusted Soils,
W73-13379 2G

CRUSTS
A Numerical and Similarity Analysis of Infiltration Into Crusted Soils,
W73-13379 2G

CRYPTOMERIA-JAPONICA
Change in the Free Amino Acid Content in Cryptomeria Japonica Transplants Under Various Soil Moisture Conditions,
W73-13592 2K

CULTURES
Influence of Sulfite on Growth, Slime, and Fluoresecent Pigment Formation by Pseudomonas Aeruginosa,
W73-13237 5C

Metabolism of Endothall by Aquatic Microorganisms,
W73-13258 5C

Differentiation of Mycobacterium tuberculosis from Other Mycobacteria by Susceptibility to Ethyl and Methyl Esters of p-Nitrobenzoic Acid,
W73-13513 5C

CULTURING TECHNIQUES
Apparatus for Semi-Continuous Culture of Daphnia,
W73-13239 5A

CULTURING VESSELS
Apparatus for Semi-Continuous Culture of Daphnia,
W73-13239 5A

CURRENTS (WATER)
Drogue Measurements of the Circulation in Grand Traverse Bay, Lake Michigan,
W73-13033 2H

Use of Computers to Compute Unsteady Wind Currents in Bodies of Water as Illustrated by Lake Baykal (Primeneniye EVM dlya rascheta neustanovivshikhsya vetrovykh techeniy v vodoyemakh (na primere oz. Baykal)),
W73-13053 2H

CUTTING (FORESTS)
Effect of Clear Cutting in the Water Regime of the Principal Forest Trees of the Sevan Shore, (In Russian),
W73-13593 4A

CYANIDE
The Polarographic Determination of Trace Amounts of Cyanide,
W73-13067 5A

CYANIDES
Treatment of Complex Cyanide for Reuse or Disposal,
W73-13468 5D

CYANOPHYTA
Nitrogen-Fixing Blue-Green Algae of Soils, Rice Fields and Ephemeral Basins of the Southern Ukraine, (In Russian),
W73-13391 5C

A Study of the Blue-Green Algae From Paddy Field Soils of India,
W73-13498 5C

The Influence of Environmental Factors on the Distribution of Freshwater Algae: An Experimental Study. I. Introduction and the Influence of Calcium Concentration,
W73-13546 5C

CYCLING NUTRIENTS
Glucose Flux at the Sediment-Water Interface of Toronto Harbour, Lake Ontario, With Reference to Pollution Stress,
W73-13236 5B

CZECHOSLOVAKIA
Age and Growth of the 'Rainbow trout' (Salmo Gairdnerii Irideus Gibbons 1855) Living in the Water Valley Reservoir of the Hnilec Valley, (In Czech),
W73-13609 2I

Contribution to the Knowledge of Scirpetum Silvatici in Czechoslovakia (Western Part),
W73-13616 2I

CZECHOSLOVAKIA (DANUBE RIVER)
On the Helminth Fauna of Fishes in the Small Danube (In Czech),
W73-13626 2I

CZECHOSLOVAKIA (LIPTAUER TARA)
Changes in Species Composition of Nitrophilous Edge Associations in Studeny and Rohacsky Valleys in the Liptauer Tatra,
W73-13608 2I

DAIRY INDUSTRY
Process for the Reduction of the Biochemical Oxygen Demand of Sewage, and for the Recovery of the Inherent Protein,
W73-13334 5D

DAM DESIGN
Theory and Problems of Water Percolation,
W73-13563 8D

DAPHNIA
Apparatus for Semi-Continuous Culture
Daphnia,
W73-13239

DATA ACQUISITION SYSTEMS
Data Acquisition Systems in Water Qua
Management,
W73-13024

DATA COLLECTIONS
A Procedure for Assessing Water Resour
for Urban Planning,
W73-13035

W73-13619 2D

DIAGENESIS
The Significance of the Solution of Feldspar in Porosity Development,
W73-13537 2J

Oceanic Sediments and Their Diagenesis: Some Examples From Deep-Sea Drilling,
W73-13542 2J

DIAMOND DRILLING
Core Orientation,
W73-13567 8C

DIAPTOMUS PALLIDUS
The Effect of Temperature on the Development Rate of the Major Life Stages of Diaptomus Pallidus Herrick,
W73-13456 5C

DIATOMACEOUS EARTH
Optimum Economical Design for Municipal Diatomite Filter Plants,
W73-13090 5F

DIATOMITE FILTERS
Optimum Economical Design for Municipal Diatomite Filter Plants,
W73-13090 5F

DIATOMS
Freshwater Diatoms in Thailand,
W73-13570 5A

Characteristics of Diatoms of Present-Day Glacial Lakes of the Polar Urals,
W73-13613 2H

DIAZINON
Some Procedures for Isolating Toxic Metabolites of Phosphorothionate Pesticides from Animal Tissues and Fluids,
W73-13196 5A

DIELDRIN
Effects of Fixation on the Extraction of Dieldrin and p,p'-DDT from Muscle Tissue,
W73-13247 5A

DIESNA RIVER (USSR)
Natural Tularemia Foci Structure in the Floodlands of Small and Medium Rivers. II. Epizootologic Nature of Elementary Foci (In Russian),
W73-13628 5C

DIETHYLDITHIOCARBAMATES
Mass Spectrometric Determination of Diethyldithiocarbamates,
W73-13241 5A

DIPTERA
Study of the Biology of Pelopia punctipennis Mg. (Chironomidae, Diptera) in the Mingechaur Reservoir (In Russian),
W73-13621 2H

DISCHARGE (WATER)
Ground-Water Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1972.
W73-13515 4B

DISCRETIZATION PROCEDURES
Loss of Information by Discretizing Hydrologic Series,
W73-13075 7A

DISINFECTION
Adsorbing and Adhesive Materials for Virus Removal from Water, (In Russian),
W73-13389 5F

The Present Status of Research on the Disinfection of Drinking Water in the USSR,
W73-13390 5F

DISPERSION
Effect of Solute Dispersion on Thermal Convention in a Porous Medium Layer,
W73-13381 2F

DISSOCIATION CONSTANTS
Complexes Affecting the Solubility of Calcium Carbonate in Water,
W73-13004 2H

DISSOLVED ORGANIC MATTER
Hydrocarbons from Sea Water,
W73-13257 5A

DISSOLVED ORGANICS
Effect of pH Adjustment Upon Activated Carbon Adsorption of Dissolved Organics from Industrial Effluents,
W73-13646 5D

DISSOLVED OXYGEN
Precise Shipboard Determination of Dissolved Nitrogen, Oxygen, Argon, and Total Inorganic Carbon by Gas Chromatography,
W73-13255 5A

Screening and Aerating Concentrator,
W73-13321 5D

Effects of Temperature, Salinity, and Dissolved Oxygen on the Survival of Striped Bass Eggs and Larvae,
W73-13460 5C

DISSOLVED SOLIDS
Simplified Method for Determining Tower Drift Rate,
W73-13457 5B

DISTILLATION
Solid Waste Disposal and Water Purification Method and Apparatus,
W73-13320 5D

Apparatus for Distillation of Fluids,
W73-13322 3A

DISTRIBUTION PATTERNS
Phytoplankton Population Dynamics and Distribution in Two Adjoining Lakes in Srinagar: I. Macroflora in Relation to Phytoplankton,
W73-13096 2H

Productivity and Distribution of Trichop Larvae in a Colorado Mountain Stream,
W73-13124

SOND Cruise 1965 Factor and Clu Analyses of the Plankton Results, A Gen Summary,
W73-13507

The Influence of Environmental Factors on Distribution of Freshwater Algae An Exp mental Study. I. Introduction and the Influ of Calcium Concentration,
W73-13546

Nature of the Bottom and Distribution Benthic Organisms in the Bol Region (Eas Archipelago of Lake Chad),
W73-13618

DIURNAL FLUCTUATIONS
Diurnal Fluctuations in Soil Water Potentia
W73-13438

DNEPER RIVER (USSR)
Agricultural Characteristics of the Bo Land of DNEPR River, (In Byelorussian),
W73-13578

DOMESTIC WASTES
Variations in Characteristics of Wastewate fluent at the Mason Farm Wastewater T ment Plant, Chapel Hill, North Carolina,
W73-13087

Solid Waste Disposal and Water Purific Method and Apparatus,
W73-13320

DON RIVER (USSR)
Variations in Grain Size of Bottom Sedir in Lowland and Mountain Streams menchivost' krupnosti donnykh otlozheniy ninnykh i gornykh rek),
W73-13051

DOUGLAS FIR TREES
Dew: An Addition to the Hydrologic Ba of Douglas Fir,
W73-13366

DRAINAGE
Salinity and Drainage in a Brown Chern Irrigated at Different Minimum Moisture tents,
W73-13109

DRAINAGE EFFECTS
One-Dimensional Consolidation of a Layer with Impeded Drainage Boundaries
W73-13368

DRAWDOWN
On the Analysis of 'Slug Test' Data,
W73-13369

Subsidence of the Venice Area During th 40,000 Yr,
W73-13526

DREDGING
Ecological Effects of Offshore Dredgin Beach Nourishment: A Review,
W73-13290

Maintenance of Great South Bay Patchogue River, New York, Navigatio ject (Final Environmental Statement).
W73-13524

DRIFT CURRENTS
Use of Computers to Compute Unsteady Wind Currents in Bodies of Water as Illustrated by Lake Baykal (Primeneniye EVM dlya rascheta neustanovivshikhsya vetrovykh techeniy v vodoyemakh (na primere oz. Baykal)),
W73-13053 2H

DRILLING EQUIPMENT
Dual String Drilling Method Yields Improved Samples,
W73-13565 8C

DROGUE TECHNIQUES
Drogue Measurements of the Circulation in Grand Traverse Bay, Lake Michigan,
W73-13033 2H

DROUGHT
Effect of Awns and Drought on the Supply of Photosynthate and Its Distribution Within Wheat Ears,
W73-13595 3F

DRY COOLING TOWERS
Dry Cooling Tower Uses Steel Structure,
W73-13451 5D

DRY FARMING
Dry Farming: Uncertainty in Land and Water Productivity,
W73-13160 3F

DRY-LAND FARMING
Economic Significance of Dry-Land Farming in the Arid Northern Negev of Israel,
W73-13121 3F

DRYING
Influence of Surface Soil Conditions on Drying in Early Spring,
W73-13098 3F

DUAL STRING DRILLING
Dual String Drilling Method Yields Improved Samples,
W73-13565 8C

DUNES
Barrier Islands, Sand Spits and Dunes in the Southern Gulf of St. Lawrence,
W73-13206 2J

Heavy Mineral Concentrating Processes and Density/Shape/Size Equilibria in the Marine and Coastal Dune Sands of the Apalachicola, Florida, Region,
W73-13540 2L

DUNES (DEFORMATION)
Deformational Structures in Brazilian Coastal Dunes,
W73-13123 2G

DURSBAN
Avoidance of Pesticides by Grass Shrimp (Palaemonetes pugio),
W73-13173 5C

DYES
Effect of Dyes on Bacterial Growth,
W73-13243 5B

DYNAMIC FLOOD ROUTING
Technique for Implicit Dynamic Routing in Rivers with Tributaries,
W73-13363 2E

DYNAMIC PROGRAMMING
Design of Optimal Water Distribution Networks Using Dynamic Programming,
W73-13072 4A

Natural Regime Hydrological Network Planning, A Methodological Discussion,
W73-13136 6A

Climatic Uncertainty Effects on Management and Design of Reservoir-Irrigation Systems,
W73-13137 3F

DYNAMICS
Design of Experiments for Estimating Process Dynamics,
W73-13147 4A

E. COLI
Persistence of Virus and Bacteria in Seawater,
W73-13272 5C

ECOLOGICAL BALANCE
The Importance of Discoveries in Nematology to Human Welfare.
W73-13427 2I

ECOLOGY
The Plant Ecology of Utah's Desert Rangelands,
W73-13310 2I

A Chemical Approach to the Problem of Environmental Contamination,
W73-13586 6G

ECONOMIC ACTIVITIES
The Impact of Water Resources on the Location of Economic Activities,
W73-13149 6D

ECONOMIC ANALYSIS
Optimal Design Strategy for Small Flood-Control Structures,
W73-13161 8B

ECONOMIC EFFICIENCY
Optimal Design Strategy for Small Flood-Control Structures,
W73-13161 8B

Heat Recovery in Process Plants,
W73-13431 5D

ECONOMICS
Optimum Economical Design for Municipal Diatomite Filter Plants,
W73-13090 5F

International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol. II.
W73-13134 4A

The Impact of Water Resources on the Location of Economic Activities,
W73-13149 6D

Upper Mississippi River Comprehensive Basin Study, Appendix P--Economic Base Study and Projections.
W73-13496 6B

ECONOMIZING TECHNIQUES
Decision Making in Water Resource Allocation,
W73-13301 6B

ECOSYSTEMS
Contributions of Allochthonous Detritus to the Energy Regime of Doe Run, Meade County, Kentucky,
W73-13056 5B

Problems of Water Resource Development in the Gulf Coast Estuarine Zone,
W73-13152 2L

Trends in Methodology for Evaluation of Effects of Pollutants on Marine Organisms and Ecosystems,
W73-13171 5C

EDEN VALLEY (WYO)
Water and Land Resources in Eden Valley, Wyoming,
W73-13044 3F

EELS
Temperature-Dependence of Permeability to Water and to Sodium of the Gill Epithelium of the Eel Anguilla Anguilla,
W73-13475 5C

EFFLUENTS
Final Environmental Statement Related to Operation of Surry Power Station Unit 1.
W73-13408 5C

Aquatic, Bioenvironmental Studies in the Columbia River at Hanford 1945-1971. A Bibliography with Abstracts,
W73-13409 5B

Final Environmental Statement Related to the St. Lucie Plant Unit No. 1.
W73-13410 5C

Final Environmental Statement Related to Construction of Nine Mile Point Nuclear Station Unit 2.
W73-13413 5C

Ecological Comparisons of Thermally Affected Aquatic Environments,
W73-13439 5C

EGGS
The Effect of Temperature on the Development Rate of the Major Life Stages of Diaptomus Pallidus Herrick,
W73-13456 5C

ELECTRIC POWER
Geothermal Energy--Resources, Production, Stimulation.
W73-13214 6D

Introduction: The Energy Outlook,
W73-13215 6D

Worldwide Status of Geothermal Resources Development,
W73-13216 6D

Assessment of U.S. Geothermal Resources,
W73-13217 6D

Characteristics of Geothermal Resources,
W73-13218 3E

Explorations for Geothermal Resources,
W73-13219 3E

Steam Production at the Geysers Geothermal Field,
W73-13220 3E

Design and Operation of the Geysers Power Plant,
W73-13221 8C

The Vapor-Turbine Cycle for Geothermal Power Generation,
W73-13222 8C

Water from Geothermal Resources,
W73-13223 3A

ELECTRIC POWER

Environmental Impact of Geothermal Development,
W73-13224 6G

Stimulation of Geothermal Systems,
W73-13225 8C

Recovery of Geothermal Energy from Hot, Dry Rock with Nuclear Explosives,
W73-13226 8H

Explosive Stimulation of Hydrothermal Reservoirs,
W73-13227 8H

Induction and Growth of Fractures in Hot Rock,
W73-13228 8H

Geothermal Resources Research,
W73-13232 6D

ELECTRIC POWER DEMAND

Geothermal Energy--Resources, Production, Stimulation.
W73-13214 6D

Introduction: The Energy Outlook,
W73-13215 6D

Worldwide Status of Geothermal Resources Development,
W73-13216 6D

Assessment of U.S. Geothermal Resources,
W73-13217 6D

Characteristics of Geothermal Resources,
W73-13218 3E

Explorations for Geothermal Resources,
W73-13219 3E

Steam Production at the Geysers Geothermal Field,
W73-13220 3E

Design and Operation of the Geysers Power Plant,
W73-13221 8C

Environmental Impact of Geothermal Development,
W73-13224 6G

Stimulation of Geothermal Systems,
W73-13225 8C

Explosive Stimulation of Hydrothermal Reservoirs,
W73-13227 8H

Induction and Growth of Fractures in Hot Rock,
W73-13228 8H

Geothermal Resources Research,
W73-13232 6D

ELECTRIC POWERPLANTS

Environmental Legislation: How it Affects Fossil-Fuel-Fired Power-Generating Equipment,
W73-13474 6E

ELECTRICAL STUDIES

Detection of Fresh Water Aquifers in the Glacial Deposits of Northwestern Missouri by Geoelectrical Methods,
W73-13213 4B

ELECTRICAL WELL LOGGING

Estimating Water Quality from Electrical Logs,
W73-13556 4B

ELECTROCHEMICAL BEHAVIOR

A Potassium-Selective Silicone-Rubber Membrane Electrode Based on a Neutral Carrier,
W73-13185 5A

The Calibration and Response of Ion-Selective Electrodes at Low Concentrations of Primary Ions,
W73-13188 2K

Recent Results on the Dynamic Response of Precipitate-Based Ion-Selective Electrodes,
W73-13189 2K

A Rugged Silver-Silver Chloride Electrode for Field Use,
W73-13193 7B

Enzyme Electrodes,
W73-13266 5A

ELECTROCHEMICAL PROBE

Chemical Composition of Ocean Using a Direct Measuring Oceanographic Electrochemical Probe,
W73-13294 2K

ELECTRODELESS DISCHARGE LAMPS

Atomic Fluorescence Spectrometry with a Graphite Rod Atomizer and Thermostated Electrodeless Discharge Lamps,
W73-13260 5A

ELECTROLYSIS

Treatment of Complex Cyanide for Reuse or Disposal,
W73-13468 5D

ELECTROLYTES

Effects of a Polyelectrolyte as a Filter Aid,
W73-13089 5F

Treatment of Acid Mine Waters,
W73-13549 5F

ELECTROMETRIC METHODS

Apparatus for Remote Centralized Measurement of Soil Humidity by the Electrometric Method, (In Italian),
W73-13582 2G

ELECTRON CAPTURE GAS CHROMATOGRAPHY

Parathion Exposure Studies. A Gas Chromatographic Method for the Determination of Low Levels of p-Nitrophenol in Human and Animal Urine,
W73-13174 5A

Electron Capture Gas Chromatographic Analysis of DDA: Utilization of 2-Chloroethanol Derivative,
W73-13176 5A

Polychlorobiphenyls in North Atlantic Ocean Water,
W73-13178 5A

Extraction and Gas Chromatographic Determination of Methyl, -Ethyl-, and Methoxyethylmercury (II) Halides,
W73-13182 5A

The Determination of Selenium in Sea Water by Gas Chromatography with Electron-Capture Detection,
W73-13186 5A

ELUTRIATION

An Elutriator Method for Particle-Size Analysis with Quantitative Silt Fractionation,
W73-13533 2J

EMPLOYMENT OPPORTUNITIES

Evaluation of Discontinuities in Regional Population Projections,
W73-13006 6B

ENDOTHALL

Metabolism of Endothall by Aquatic Microorganisms,
W73-13258 5C

ENDRIN

Avoidance of Pesticides by Grass Shrimp (Palaemonetes pugio),
W73-13173 5C

ENERGY

Cloudiness as a Global Climatic Feedback Mechanism: The Effects on the Radiation Balance and Surface Temperature of Variations in Cloudiness,
W73-13441 2B

ENERGY CONSERVATION

Energy Implications of Several Environmental Quality Strategies,
W73-13421 5G

ENGINEERING STRUCTURES

A Mathematical Model for Preliminary Evaluations of Candidate Reservoir Systems,
W73-13529 8D

ENTERIC BACTERIA

Fatty Acid Compositions of Paracolons: Arizona, Citrobacter, and Providencia,
W73-13252 5C

Persistence of Virus and Bacteria in Seawater,
W73-13272 5C

ENVIRONMENT

The President's 1973 Environmental Program.
W73-13528 6G

ENVIRONMENTAL CONTROL

Survey of Environmental Radioactivity, January 1-December 31, 1972,
W73-13402 5B

Environmental Legislation: How it Affects Fossil-Fuel-Fired Power-Generating Equipment,
W73-13474 6E

Upper Mississippi River Comprehensive Basin Study, Appendix B--Aesthetic and Cultural Values.
W73-13482 6B

ENVIRONMENTAL EFFECTS

Water Pollution: Environmental Impacts and Means of Control,
W73-13078 5G

Environmental Impact of Geothermal Development,
W73-13224 6C

Environmental Aspects of Nuclear Stimulation
W73-13230 8I

Corrosion and Scaling in Nuclear-Stimulate Geothermal Power Plants,
W73-13231 8I

Interacting Effects of pH, Temperature, an Salt Concentration on Growth and Survival o Vibrio Parahaemolyticus,
W73-13245 5(

Persistence of Virus and Bacteria in Seawater,
W73-13272 5(

Ecological Effects of Offshore Dredging and Beach Nourishment: A Review,
W73-13290 5C

The Role of Paper Mill Additives as Potential Stream Pollutants,
W73-13338 5B

Energy Implications of Several Environmental Quality Strategies,
W73-13421 5G

Ecological Comparisons of Thermally Affected Aquatic Environments,
W73-13439 5C

Research Needs on Waste Heat Transfer from Large Sources into the Environment.
W73-13473 5G

Thermal Effects on Aquatic Organisms, Annotated Bibliography of 1971 Literature,
W73-13478 5C

Maintenance of Great South Bay and Patchogue River, New York, Navigation Project (Final Environmental Statement).
W73-13524 8B

Proposed Central Arizona Project (Final Environmental Statement). Available from the National Technical Information Service as EIS-AZ-72-5357-F1. Bureau of Reclamation, Boulder City, Nevada. (FES 72-35) Septem ber 972, 597 p. Maps. 203 ref.
W73-13552 4A

VIRONMENTAL ENGINEERING

Energy Implications of Several Environmental Quality Strategies,
W73-13421 5G

VIRONMENTAL IMPACT STATEMENTS

Final Environmental Statement Related to Operation of Surry Power Station Unit 1.
W73-13408 5C

Final Environmental Statement Related to the St. Lucie Plant Unit No. 1.
W73-13410 5C

Final Environmental Statement Related to the Continuation of Construction of Unit 2 and the Operation of Units 1 and 2 Millstone Nuclear Power Station.
W73-13411 5C

Final Environmental Statement Related to the Construction of Susquehanna Steam Electric Station Units 1 and 2.
W73-13412 5C

Maintenance of Great South Bay and Patchogue River, New York, Navigation Project (Final Environmental Statement).
W73-13524 8B

VIRONMENTAL IMPACT STATMENTS

Final Environmental Statement Related to Construction of Nine Mile Point Nuclear Station Unit 2.
W73-13413 5C

VIRONMENTAL IMPACTS

Water Pollution: Environmental Impacts and Means of Control,
W73-13078 5G

VIRONMENTAL PROGRAM (1973)

The President's 1973 Environmental Program.
W73-13528 6G

ENZYMATIC TESTS

A Sensitive mechanized Determination of ATP Plus ADP,
W73-13177 5A

ENZYMES

Enzymatic NH3-N Determination: A Specific Method for the Determination of Ammonia in Water and Sediments,
W73-13068 5A

EPHEMERA DANICA

Uptake and Accumulation of DDT and PCB by Ephemera Danica (Ephemeroptera) in Continuous-Flow Systems,
W73-13265 5C

EPIZOOTOLOGIC STUDIES

Natural Tularemia Foci Structure in the Floodlands of Small and Medium Rivers. II. Epizootologic Nature of Elementary Foci (In Russian),
W73-13628 5C

EQUATIONS

Integrodifferential Equations for Systems of Leaky Aquifers and Applications: 1. The Nature of Approximate Theories,
W73-13378 2F

EQUIPMENT

Improved Water Analysis Kit,
W73-13297 7B

A Sediment Squeezer for Removal of Pore Waters Without Air Contact,
W73-13531 2J

A Splitter for Unconsolidated Cores Taken in Plastic Liners,
W73-13535 2J

EROSION

Grass and Grass Utilization in Iceland,
W73-13510 4A

ERRORS

Errors of Measurement, Precision, Accuracy and the Statistical Comparison of Measuring Instruments,
W73-13194 7A

A Digital Registration System for Net Photosynthesis and Transpiration Measurements in the Field and an Associated Analysis of Errors,
W73-13597 2D

ESTIMATING

Some Problems in Stochastic Hydrology,
W73-13039 2A

Loss of Information by Discretizing Hydrologic Series,
W73-13075 7A

Estimating Benefits to Improved Seasonal Water Supply Forecasts: A Case Study of Irrigation Benefits,
W73-13143 3F

Bayesian Hydrologic Model Building,
W73-13144 2A

Information Content of the Regional Mean,
W73-13145 2A

ESTUARIES

The Coastal Zone as an Integral Element of Water-Resource Systems,
W73-13036 2L

Extensive Oxygen Depletion in Mobile Bay, Alabama,
W73-13065 5C

Pollution Abatement Programs in the Delaware River Estuary,
W73-13164 5G

The Use of Water Quality Simulation Models in the Analysis of the Thermal Effects Problem,
W73-13479 5B

ESTUARINE ENVIRONMENT

Problems of Water Resource Development in the Gulf Coast Estuarine Zone,
W73-13152 2L

Marine Microbiology, Five-Year Progress Report, 1967-1972,
W73-13339 5A

ESTUARINE MICROORGANISMS

Competition for Urea Among Estuarine Microorganisms,
W73-13108 5C

ETHYLENETHIOUREA

Residue Determination of Ethylenethiourea (2-Imidazolidinethione) From Tomato Foliage, Soil, and Water,
W73-13259 5A

ETIOLOGICAL FACTORS

The Effect of the Water Factor in Spreading Intestinal Infections, (In Russian),
W73-13583 5C

EUGLENOPHYTA

The Influence of Environmental Factors on the Distribution of Freshwater Algae: An Experimental Study. I. Introduction and the Influence of Calcium Concentration,
W73-13546 5C

EUPHAUSIIDS

SOND Cruise 1965: Factor and Cluster Analyses of the Plankton Results, A General Summary,
W73-13507 5A

EUROPEAN USSR

Regime, Theory, and Methods of Calculation and Measurement of Sediments and Waste Waters (Rezhim, teoriya, metody rascheta i izmereniya nanosov i stochnykh vod).
W73-13045 2J

Sediment Yield of Streams in European Russia (Stok nanosov rek Yevropeyskoy territorii SSSR),
W73-13046 2J

Relation of Average Long-Term Suspended-Sediment Yield of Streams in European Russia to Physiographic Factors (Zavisimost' srednego mnogoletnego stoka vzveshennykh nanosov rek Yevropeyskoy territorii SSSR ot fiziko-geograficheskikh faktorov),
W73-13047 2J

Experiment in Determining Total Sediment Discharge (Suspended Load and Bed Load) (Opyt vychisleniya polnogo raskhoda nanosov (vzveshennykh i vlekomykh)),
W73-13049 2J

EUTROPHIC LAKES

Oxidation Reduction Potentials, Oxygen Concentration and Oxygen Uptake of Profundal Sediments in a Eutrophic Lake,
W73-13599 5C

EUTROPHIC POUNDS
The Vertical Distribution of Some Ciliated Protozoa in the Plankton of a Eutrophic Pond During Summer Stratification,
W73-13101 5C

EUTROPHICATION
The Kinetics of NH4 Uptake by Ceratophyllum,
W73-13504 5C

EVALUATION
Loss of Information by Discretizing Hydrologic Series,
W73-13075 7A

Upper Mississippi River Comprehensive Basin Study: Volume I, Main Report.
W73-13480 6B

EVALUATIONS
Treatment of Some of the Uncertainties Encountered in the Conduct of Hydrologic Cost-Effectiveness Evaluations,
W73-13154 6B

EVAPORATION
Apparatus for Distillation of Fluids,
W73-13322 3A

Process and System for Extracting Salts, Concentrated Brine, and/or Pure Water From Saline Water,
W73-13323 3A

Network Density of Temperature Profile Stations and its Influence on the Accuracy of Lake Evaporation Calculations,
W73-13365 2D

Simplified Method for Determining Tower Drift Rate,
W73-13457 5B

An Experiment Determining the Total Evaporation from a Field of a Planned Irrigation Block of Land in Southern Mugan of Azerbaidzhan SSR, (In Russian),
W73-13605 2D

A Battery Driven Measuring Apparatus for the Electrical Registration of Evaporation or Dewfall, (In German),
W73-13619 2D

EVAPORATION RATES
Potential Evaporation from Pasture and Potatoes at Aspendale,
W73-13296 2D

EVAPORATORS
Multi-Stage Flash Distillation Process,
W73-13336 3A

Effect of Noncondensables in Sea Water Evaporators,
W73-13463 3E

EVAPORIMETER
A Battery Driven Measuring Apparatus for the Electrical Registration of Evaporation or Dewfall, (In German),
W73-13619 2D

EXPANSIVE CLAYS
Fixing Cation Interaction with Blister-Like Osmotic Swelling on Vermiculite Cleavages,
W73-13425 2G

EXPLORATION
Detection of Fresh Water Aquifers in the Glacial Deposits of Northwestern Missouri by Geoelectrical Methods,
W73-13213 4B

Explorations for Geothermal Resources,
W73-13219 3E

Core Orientation,
W73-13567 8C

EXPLOSIONS
Project Tugboat: Explosive Excavation of a Harbor in Coral,
W73-13212 8H

EXPLOSIVES
Project Tugboat: Explosive Excavation of a Harbor in Coral,
W73-13212 8H

Chemical Explosive Stimulation of Geothermal Wells,
W73-13229 8H

FABRICATION
Ion-Selective Carbon-Paste Electrodes for Halides and Silver (I) Ions,
W73-13187 5A

FALLOUT
W73-13416 5B

A Simple Model of Strontium and Manganese Dynamics in a Tropical Rain Forest,
W73-13419 5B

Distribution of CS137 in Soils and Vegetation on the Island of Puerto Rico,
W73-13423 5B

FARM WASTES
Institutional Requirements for Optimal Water Quality Management in Arid Urban Areas,
W73-13002 5G

Benthic Macroinvertebrate Community Structure in a Great Plains Stream Receiving Feedlot Runoff,
W73-13180 5C

Survival of Salmonella Typhimurium in Animal Manure Disposal in a Model Oxidation Ditch,
W73-13253 5C

FATE OF POLLUTANTS
Epoxidation and Fate of (C-14)Aldrin in Insecticide-Resistant and Susceptible Populations of Mosquitofish (Gambusia affinis),
W73-13190 5B

Metabolism of Nitrilotriacetate by Cells of Pseudomonas Species,
W73-13244 5B

Methanol Metabolism in Pseudomonad C,
W73-13256 5C

Metabolism of Endothall by Aquatic Microorganisms,
W73-13258 5C

Methylmercury: Bacterial Degradation in Lake Sediments,
W73-13267 5B

Sulphate Deposition by Precipitation Into Lake Ontario,
W73-13270 5B

FATHEAD MINNOWS
The Effects of Methoxychlor on Fishes: Acute Toxicity and Breakdown Studies,
W73-13122

FATTY ACIDS
Fatty Acid Compositions of Paracolo Arizona, Citrobacter, and Providencia,
W73-13252

FAUNA
On the Helminth Fauna of Fishes in the Sa Danube (In Czech),
W73-13626

FAUNA PARASITE
Parasite Fauna of Different Forms of the A tic Char, Salvelinus Alpinus L., from Kamch ka, (In Russian),
W73-13611

FECAL COLIFORMS
Coliforms, Fecal Coliforms, and F Streptococci as Indicators of Water Pollutio
W73-13262

FECAL POLLUTION
Coliforms, Fecal Coliforms, and F Streptococci as Indicators of Water Pollutio
W73-13262

FECAL STREPTOCOCCI
Coliforms, Fecal Coliforms, and F Streptococci as Indicators of Water Pollutio
W73-13262

FEDERAL GOVERNMENT
Upper Mississippi River Comprehensive B Study, Appendix O--State and Federal W Laws, Policies, and Programs.
W73-13495

FEDERAL WATER POLLUTION CONTROL ACT
Water Pollution: Environmental Impacts Means of Control,
W73-13078

FEED LOTS
Benthic Macroinvertebrate Community S ture in a Great Plains Stream Receiving Fe Runoff,
W73-13180

FEEDLOT RUNOFF
Benthic Macroinvertebrate Community S ture in a Great Plains Stream Receiving Fe Runoff,
W73-13180

FELDSPARS
The Significance of the Solution of Feldsp Porosity Development,
W73-13537

FERMENTATION
Process for the Reduction of the Bioche Oxygen Demand of Sewage, and fo Recovery of the Inherent Protein,
W73-13334

FERRICYANIDE
Treatment of Complex Cyanide for Reu Disposal,
W73-13468

FERTILIZATION
Terrestrial Plant Ecology.
W73-13340

FERTILIZERS
Selected Irrigation Return Flow Quality Abstracts 1970i1971, Second Annual Issue,
W73-13472 5G

Effects of Phosphorus Application Rate, Soil Properties, and Leaching Mode on P-32 Movement in Soil Columns,
W73-13553 5B

FIELD CAPACITY
Use of a Neutron Moisture Probe to Determine the Storage Coefficient of an Unconfined Aquifer,
W73-13554 4B

FIELD MEASUREMENTS
A Digital Registration System for Net Photosynthesis and Transpiration Measurements in the Field and an Associated Analysis of Errors,
W73-13597 2D

FILTERS
Effects of a Polyelectrolyte as a Filter Aid,
W73-13089 5F

Optimum Economical Design for Municipal Diatomite Filter Plants,
W73-13090 5F

Fritted Disc Funnels and Tapered Stainless Steel Tubes and Stoppers for Use in Pesticide Residue Analysis,
W73-13246 5A

FILTRATION
Effects of a Polyelectrolyte as a Filter Aid,
W73-13089 5F

Process Design Manual for Phosphorus Removal,
W73-13129 5D

Fritted Disc Funnels and Tapered Stainless Steel Tubes and Stoppers for Use in Pesticide Residue Analysis,
W73-13246 5A

Water Purifying Apparatus,
W73-13326 5D

Liquid Filtering Apparatus,
W73-13327 5D

Method for Efficiently Separating Slurry-State Liquid into Solid Part and Liquid Part and an Apparatus Therefor,
W73-13330 5D

Evaluation and Development of Physical-Chemical Techniques for the Separation of Emulsified Oil from Water,
W73-13642 5D

Treatment of Glue Factory Wastes by Physiocochemical Processes,
W73-13647 5D

FINITE ELEMENT ANALYSIS
Finite Element Solution to Unconfined Groundwater Flow With Infiltration,
W73-13031 5B

FISH
A Method for Rting Chemicals for Potency Against Fish and Other Organisms,
W73-13269 5C

Comparative Toxicity of 29 Nitrosalicylanilides and Related Compounds to Eight Species of Fish,
W73-13288 5C

Upper Mississippi River Comprehensive Basin Study, Appendix L--Fish and Wildlife Resources.
W73-13492 6B

FISH EGGS
Effects of Incubation Temperature on Survival of Largemouth Bass Eggs,
W73-13080 5C

FISH EMBRYOS
Accumulation and Retention of 85Sr Marks by Young Largemouth Bass,
W73-13304 5C

FISH HANDLING FACILITIES
An Aquarium Temperature Control System for Field Stations,
W73-13079 5C

FISH LOCOMOTION
Effects of Copper on the Locomotor Orientation of Fish,
W73-13021 5C

FISH PARASITES
Study of Parasites in Fishes of the Sind River: I. Trematodes of Hilsa ilisha (Ham.),
W73-13634 5C

FISH POPULATIONS
Epoxidation and Fate of (C-14)Aldrin in Insecticide-Resistant and Susceptible Populations of Mosquitofish (Gambusia affinis),
W73-13190 5B

FLAD
Changes During Four Years in the Aquatic Macrovegetation in a Flad in Northern Stockholm Archipelago,
W73-13580 5C

FLAME PHOTOMETRY
Automated Water Monitoring Instrument for Phosphorus Contents,
W73-13470 5A

FLAMELESS ATOMIC ABSORPTION SPECTROPHOTOMETRY
Distribution and Background Levels of Mercury in Sediment Cores From Selected Wisconsin Lakes,
W73-13264 5B

FLASH DISTILLATION
Process and System for Extracting Salts, Concentrated Brine, and/or Pure Water From Saline Water,
W73-13323 3A

Multi-Stage Flash Distillation Process,
W73-13336 3A

FLOCCULATION
Process Design Manual for Phosphorus Removal,
W73-13129 5D

FLOOD CONTROL
Optimal Design Strategy for Small Flood-Control Structures,
W73-13161 8B

The Sensitivity of Return Periods to Variations in Retention Levels for Different Definitions of Shortage,
W73-13162 4A

Functional and Psychological Integration in a Rural Community,
W73-13305 6B

Upper Mississippi River Comprehensive Basin Study, Appendix I--Flood Control.
W73-13489 6B

FLOOD FORECASTING
Magnitude and Frequency of Floods in Small Drainage Basins in Idaho--A Design Method,
W73-13208 4A

FLOOD FREQUENCY
Magnitude and Frequency of Floods in Small Drainage Basins in Idaho--A Design Method,
W73-13208 4A

FLOOD MAPS
Flood of March 19-20, 1970, Metropolitan Birmingham and Jefferson County, Alabama,
W73-13521 7C

FLOOD STAGES
Flood of March 19-20, 1970, Metropolitan Birmingham and Jefferson County, Alabama,
W73-13521 7C

FLOODLANDS
Natural Tularemia Foci Structure in the Floodlands of Small and Medium Rivers. II. Epizootologic Nature of Elementary Foci (In Russian),
W73-13628 5C

FLOODS
Flood of March 19-20, 1970, Metropolitan Birmingham and Jefferson County, Alabama,
W73-13521 7C

FLORA
Phytoplankton Population Dynamics and Distribution in Two Adjoining Lakes in Srinagar: I. Macroflora in Relation to Phytoplankton,
W73-13096 2H

The Flora and Vegetation of Pond-Banks in the Southern Part of the Entre-Sambre-Et-Meuse,
W73-13615 2I

FLORIDA
Water Resources of Broward County, Florida,
W73-13209 2A

Final Environmental Statement Related to the St. Lucie Plant Unit No. 1.
W73-13410 5C

Heavy Mineral Concentrating Processes and Density/Shape/Size Equilibria in the Marine and Coastal Dune Sands of the Apalachicola, Florida, Region,
W73-13540 2L

FLORIDA (WEKIWA RIVER)
Ecological Observations on the Emergence of Cercariae from Goniobasis Floridensis Reeve From the Wekiva River, Fla.,
W73-13103 5C

FLOTATION
Screening and Aerating Concentrator,
W73-13321 5D

Surface Adsorption: A Promising Approach for the Treatment of Tannery Effluents,
W73-13648 5D

FLOW CHARACTERISTICS
Magnitude and Frequency of Floods in Small Drainage Basins in Idaho--A Design Method,
W73-13208 4A

FLOW RATES
Optimum Economical Design for Municipal Diatomite Filter Plants,
W73-13090 5F

FLUID MECHANICS
Convective Instability in Liquid Pools Heated From Below,
W73-13442 8B

FLUVIAL SEDIMENTS
Upper Mississippi River Comprehensive Basin Study, Appendix G--Fluvial Sediment.
W73-13487 6B

FLUVIAL WATERS
Comparison of Pollution Degree of Fluvial Waters Evaluated by Means of the BOD5 Test and a Saprobiological Method,
W73-13622 5B

FOLIAR
Residue Determination of Ethylenethiourea (2-Imidazolidinethione) From Tomato Foliage, Soil, and Water,
W73-13259 5A

FOLIAR SPRAYS
On the Significance of Antitranspirants for Tropical Cultivated Plants, (In German),
W73-13394 2D

FOOD
A Method for the Detection of Traces of Nitrosamines Using Combined Gas Chromatography and Mass Spectrometry,
W73-13165 5A

FOOD CHAINS
Aquatic Organisms and Heavy Metals in Missouri's New Lead Belt,
W73-13037 5C

Plutonium Studies.
W73-13344 5B

Fate and Effects of Radionuclides in Alaska.
W73-13348 5B

W73-13416 5B

Plant Accumulations of Radioactive Strontium with Special Reference to the Strontium-Calcium Relationship as Influenced by Nitrogen,
W73-13418 5B

Dietary Intake of Cobalt by the Adult Population of Tarapur,
W73-13426 5B

FOOD HABITS
Change in Feeding and Body Condition of Brown Bullheads Overwintering in the Heated Effluent of a Power Plant,
W73-13430 5C

FOOD PROCESSING INDUSTRY
Process for the Reduction of the Biochemical Oxygen Demand of Sewage, and for the Recovery of the Inherent Protein,
W73-13334 5D

FOOD SUPPLY
Pesticides, Pollution, and Food Supply,
W73-13104 5G

FORAGE GRASSES
The Plant Ecology of Utah's Desert Rangelands,
W73-13310 2I

Prairie Sandreed (Calamovilfa longifolia): Water Infiltration and Use,
W73-13312 2I

Productivity of Tall Wheatgrass and Great Basin Wildrye Under Irrigation on a Greasewood-Rabbitbrush Range Site,
W73-13314 3B

Responses of Semidesert Grasses to Seasonal Rest,
W73-13318 4A

FORECASTING
Engineering Hydrology,
W73-13016 3B

Some Problems in Stochastic Hydrology,
W73-13039 2A

'Extended-Range' Meteorological Forecasts Applied to Multi-Reservoir Management Decisions,
W73-13139 2A

Estimating Benefits to Improved Seasonal Water Supply Forecasts: A Case Study of Irrigation Benefits,
W73-13143 3F

Strategic Uncertainty and the National Environmental Policy Act,
W73-13148 6B

Dynamic Cooling.
W73-13449 5B

FORESTS
The Hippophae Rhamnoides Alluvial Forest at Leinora, Central Norway: A Phytosociological and Ecological Study,
W73-13594 2I

FOSSIL PIGMENTS
Fossil Pigments in the Surface Sediments of a Meromictic Lake,
W73-13099 5B

FOULING
Requisites for Non-Polluting Microbicides,
W73-13476 5D

FOUNDATION INVESTIGATIONS
Transient Vibration Techniques to Determine Wave Velocities In-Situ,
W73-13055 2G

FRANCE (VILLECARTIER FOREST)
The Soils of the Villecartier Forest,
W73-13604 2G

FREQUENCY
An Analysis of Sampling-Frequency Alternatives for Fitting a Daily Stream-Temperature Model,
W73-13142 4A

FRESH WATER FISH
Toxicity of 33NCS (3'-Chloro-3-Nitrosalicylanilide) to Freshwater Fish and Sea Lamprey,
W73-13293 5C

FRESHWATER FISH
Effects of Fixation on the Extraction of Dieldrin and p,p'-DDT from Muscle Tissue,
W73-13247 5A

Mercury Contamination of Fish in Northwestern Ontario,
W73-13287 5C

Mercury Residues in Fish, 1969-1970 - National Pesticide Monitoring Program,
W73-13514 5A

FROGS
Inverse Compensation for Temperature in Oxygen Consumption of the Hylid Frog Pseudacris Triseriata,
W73-13458 5C

FUTURE PLANNING (PROJECTED)
Modelling the Regulation of Lake Superior under Uncertainty of Future Water Supplies,
W73-13140 4A

GAMMA RAYS
Study of Gamma Induced Low Temperature Oxidation of Textile Effluehnts,
W73-13022 5D

GAS BUBBLING
Analysis of Organic Constituents Present in Drinking Water,
W73-13240 5A

GAS CHROMATOGRAPHY
A Method for the Detection of Traces of Nitrosamines Using Combined Gas Chromatography and Mass Spectrometry,
W73-13165 5A

Parathion Exposure Studies. A Gas Chromatographic Method for the Determination of Low Levels of p-Nitrophenol in Human and Animal Urine,
W73-13174 5A

Electron Capture Gas Chromatographic Analysis of DDA: Utilization of 2-Chloroethanol Derivative,
W73-13176 5A

Polychlorobiphenyls in North Atlantic Ocean Water,
W73-13178 5A

Extraction and Gas Chromatographic Determination of Methyl, -Ethyl-, and Methoxyethylmercury (II) Halides,
W73-13182 5

The Determination of Selenium in Sea Water by Gas Chromatography with Electron-Capture Detection,
W73-13186 5

Gas Chromatography of Tl, Se, Te, Hg, As, Sb, Bi, Sn as Phenyl Compounds, (Gas-Chromatographie von Tl, Se, Te, Hg, As, Sb, Bi, Sn als Phenylverbindungen),
W73-13235 5

Residues of DDT in Cod from Norwegian Fjords,
W73-13249 5

Precise Shipboard Determination of Dissolved Nitrogen, Oxygen, Argon, and Total Inorganic Carbon by Gas Chromatography,
W73-13255 5

Gas Chromatographic Determination of Residues of Methylcarbamate Insecticides in Crops as Their 2,4-Dinitrophenyl Ether Derivatives,
W73-13282

Identification by Means of Retention Parameters,
W73-13511

GAS LIQUID CHROMATOGRAPHY
Fritted Disc Funnels and Tapered Stainless Steel Tubes and Stoppers for Use in Pesticide Residue Analysis,
W73-13246 5A

Hydrocarbons from Sea Water,
W73-13257 5A

Gas-Liquid Chromatographic Separation of Sulfur from Chlorinated Pesticide Residues in Wastewater Samples,
W73-13263 5A

GAS RATE
Continuous Bubble Fractionation: Part II, Effects of Bubble Size and Gas Rate,
W73-13640 5D

GC-MASS SPECTOMETRY
Analysis of Organic Constituents Present in Drinking Water,
W73-13240 5A

GC-MASS SPECTROMETRY
A Method for the Detection of Traces of Nitrosamines Using Combined Gas Chromatography and Mass Spectrometry,
W73-13165 5A

GEESE (WILD)
Reactions of Canada Geese to Reservoir Impoundment on the Snake River in Washington,
W73-13082 6G

GEOLOGIC INVESTIGATIONS
Underground Surveys with Borehold Cameras,
W73-13566 4B

GEOMORPHOLOGY
Relation of Average Long-Term Suspended-Sediment Yield of Streams in European Russia to Physiographic Factors (Zavisimost' srednego mnogoletnego stoka vzveshennykh nanosov rek Yevropeyskoy territorii SSSR ot fiziko-geograficheski kh faktorov),
W73-13047 2J

GEOPHYSICS
Detection of Fresh Water Aquifers in the Glacial Deposits of Northwestern Missouri by Geoelectrical Methods,
W73-13213 4B

GEORGIA
Cost of Waste Water Pollution Abatement in Poultry Processing and Rendering Plants in Georgia,
W73-13003 5D

Competition for Urea Among Estuarine Microorganisms,
W73-13108 5C

Description and Use of an Underwater Television System on the Atlantic Continental Shelf,
W73-13559 7B

GEOTHERMAL POWER
Geothermal Energy--Resources, Production, Stimulation.
W73-13214 6D

Introduction: The Energy Outlook,
W73-13215 6D

Worldwide Status of Geothermal Resources Development,
W73-13216 6D

Assessment of U.S. Geothermal Resources,
W73-13217 6D

Characteristics of Geothermal Resources,
W73-13218 3E

Explorations for Geothermal Resources,
W73-13219 3E

Steam Production at the Geysers Geothermal Field,

Studies of Landscape Ecology of the Natural Protection Area 'Entenfang' Near Wesseling,
W73-13388 2I

GERMINATION (RICE)
Rice Seedlings Germinated in Water with Normal and Impeded Environmental Gas Exchange,
W73-13092 3F

GEYSERS GEOTHERMAL FIELD (CALIF)
Steam Production at the Geysers Geothermal Field,
W73-13220 3E

Design and Operation of the Geysers Power Plant,
W73-13221 8C

GLACIAL DRIFT
Heat Balance of Surfaces of the Abramov Glacier and Lateral Moraine in Summer (Teplovoy balans poverkhnostey lednika Abramova i beregovoy moreny v letniy period),
W73-13352 2C

GLACIAL RIVERS
A Study of Sediment Transport in Norwegian Glacial Rivers, 1969,
W73-13026 2J

GLACIAL SEDIMENTS
A Study of Sediment Transport in Norwegian Glacial Rivers, 1969,
W73-13026 2J

Suspended-Sediment Yield from the Abramov Glacier Basin (Stok vzveshennykh nanosov s basseyna lednika Abramova),
W73-13355 2C

GLACIER MASS BUDGET
Mass Budget of the Abramov Glacier (Byudzhet massy lednika Abramova),
W73-13353 2C

GLACIER RECESSION
Description of Glacier Recession in the Amu-Dar'ya River Basin from Aerial Photographic Survey Data for 1946-66 (Kharakteristika otstupaniya lednikov basseyna r. Amudar'i po materialam aerofotos'yemki 1946-1966 gg.),
W73-13359 2C

GLACIERS
A Study of Sediment Transport in Norwegian Glacial Rivers, 1969,
W73-13026 2J

Glaciology of Soviet Central Asia (Glyatsiologiya Sredney Azii).
W73-13350 2C

Meteorological Conditions in the Abramov Glacier Basin (Meteorologicheskiye usloviya basseyna lednika Abramova),
W73-13351 2C

Heat Balance of Surfaces of the Abramov Glacier and Lateral Moraine in Summer (Teplovoy balans poverkhnostey lednika Abramova i beregovoy moreny v letniy period),
W73-13352 2C

Mass Budget of the Abramov Glacier (Byudzhet massy lednika Abramova),
W73-13353 2C

Radar Sounding of the Abramov Glacier (Radiolokatsionnoye zondirovaniye lednika Abramova),
W73-13356 2C

Average Albedo Values of Glaciers During the Ablation Season (O srednikh znacheniyakh al'bedo lednikov v period ablyatsii),
W73-13357 2C

Some Characteristics of Modern Glaciers in the Naryn River Basin (Nekotoryye cherty sovremennogo oledeneniya basseyna r. Naryna),
W73-13358 2C

Description of Glacier Recession in the Amu-Dar'ya River Basin from Aerial Photographic Survey Data for 1946-66 (Kharakteristika otstupaniya lednikov basseyna r. Amudar'i po materialam aerofotos'yemki 1946-1966 gg.),
W73-13359 2C

GLACIOLOGY
Glaciology of Soviet Central Asia (Glyatsiologiya Sredney Azii).
W73-13350 2C

Some Characteristics of Modern Glaciers in the Naryn River Basin (Nekotoryye cherty sovremennogo oledeneniya basseyna r. Naryna),
W73-13358 2C

Description of Glacier Recession in the Amu-Dar'ya River Basin from Aerial Photographic Survey Data for 1946-66 (Kharakteristika otstupaniya lednikov basseyna r. Amudar'i po materialam aerofotos'yemki 1946-1966 gg.),
W73-13359 2C

GLUE FACTORY WASTES
Treatment of Glue Factory Wastes by Physiocochemical Processes,
W73-13647 5D

GOBI DESERT
Water Reserve of Leaves of Desert-Steppe and Introduced Plants in the Gobi Desert of Mongolia, (In Russian),
W73-13574 2I

GOLD
Activation Analysis of Trace Elements in Biological Materials, (Analyse Par Activation De Mecroquantites D'Elements Dans Les Materiaux Biologique),
W73-13420 5A

GOLD RADIOISOTOPES
Activation Analysis of Trace Elements in Biological Materials, (Analyse Par Activation De Mecroquantites D'Elements Dans Les Materiaux Biologique),
W73-13420 5A

GONAD MATURATION
Gonad Maturation of Brook Trout (Salvelinus fontinalis) in a High Mountain Lake under a Modified Photoperiod,
W73-13128 2H

GRAND TRAVERSE BAY (LAKE MICHIGAN)
Drogue Measurements of the Circulation in Grand Traverse Bay, Lake Michigan,
W73-13033 2H

GRAND VALLEY (COLO)
Salt Pickup from Agricultural Lands in the Grand Valley of Colorado,
W73-13202 5B

GRAPHITE ROD ATOMIZER
Atomic Fluorescence Spectrometry with a Graphite Rod Atomizer and Thermostated Electrodeless Discharge Lamps,
W73-13260 5A

GRASS
Compeittion Between Grass and Clover for Phosphate: II. Effect of Root Activity, Efficiency of Response to Phosphate, and Soil Moisture,
W73-13097 3F

Water Loss From Cut Grass With Special Reference to Hay-Making,
W73-13119 3F

Grass and Grass Utilization in Iceland,
W73-13510 4A

GRASS GROWTH
Effect of Temperatures and Water Table Depth on the Growth of Creeping Bentgrass Roots,
W73-13105 2I

GRASSLANDS
Terrestrial Plant Ecology.
W73-13340 5B

Groundwater Hydrology of Prairie Potholes in North Dakota,
W73-13383 2F

GRAVELS
Engineering Hydrology.

Effect of Dyes on Bacterial Growth,
W73-13243 5B

Interacting Effects of pH, Temperature, and Salt Concentration on Growth and Survival of Vibrio Parahaemolyticus,
W73-13245 5C

Laboratory Observations on the Early Growth of the Abalone, Haliotis Sorenseni, and the Effect of Temperature on Larval Develooment and Settling Success,
W73-13428 5C

Change in Feeding and Body Condition of Brown Bullheads Overwintering in the Heated Effluent of a Power Plant,
W73-13430 5C

The Effect of Temperature on the Development Rate of the Major Life Stages of Diaptomus Pallidus Herrick,
W73-13456 5C

GUCOSE
Glucose Flux at the Sediment-Water Interface of Toronto Harbour, Lake Ontario, With Reference to Pollution Stress,
W73-13236 5B

GULF OF MEXICO
Problems of Water Resource Development in the Gulf Coast Estuarine Zone,
W73-13152 2L

Chlorinated Hydrocarbons in Plankton from the Gulf of Mexico and Northern Caribbean,
W73-13273 5B

Heavy Minerals of Horn Island, Northern Gulf of Mexico,
W73-13541 2J

GULF OF ST. LAWRENCE
Reconnaissance Survey of Hog Island, Prince Edward Island,
W73-13205 2J

Barrier Islands, Sand Spits and Dunes in the Southern Gulf of St. Lawrence,
W73-13206 2J

A Note on Wind and Wave Conditions in the Southern Gulf of St. Lawrence,
W73-13207 2L

HALIDES
Extraction and Gas Chromatographic Determination of Methyl, -Ethyl-, and Methoxyethylmercury (II) Halides,
W73-13182 5A

Ion-Selective Carbon-Paste Electrodes for Halides and Silver (I) Ions,
W73-13187 5A

HALOGENS
In Situ Activation Analysis of Marine Sediments with Californium-252,
W73-13295 2K

HANFORD SITE (WASH)
Aquatic, Bioenvironmental Studies in the Columbia River at Hanford 1945-1971. A Bibliography with Abstracts,
W73-13409 5B

Radioactive Waste Management - A Bibliography of Publicly Available Literature Pertaining to the USAEC's Hanford, Washington Production Site.
W73-13414 5B

HARBORS
Project Tugboat: Explosive Excavation of a Harbor in Coral,
W73-13212 8H

HARDNESS (WATER)
Complexes Affecting the Solubility of Calcium Carbonate in Water,
W73-13004 2H

HAWAII
Project Tugboat: Explosive Excavation of a Harbor in Coral,
W73-13212 8H

HAY
Water Loss From Cut Grass With Special Reference to Hay-Making,
W73-13119 3F

HEAT BALANCE
Heat Balance of Surfaces of the Abramov Glacier and Lateral Moraine in Summer (Teplovoy balans poverkhnostey lednika Abramova i beregovoy moreny v letniy period),
W73-13352 2C

HEAT EXCHANGERS
Multi-Stage Flash Distillation Process,
W73-13336 3A

Heat Recovery in Process Plants,
W73-13431 5D

Heat-Transfer Agents for High-Temperature Systems,
W73-13446 8C

Problems with Exchangers in Ethylene Plants,
W73-13465 8G

HEAT FLOW
Navifacial Temperature and Salinity Along the Track From Samoa to Hawaii, 1957-1965,
W73-13435 2E

HEAT RECOVERY SYSTEMS
Heat Recovery in Process Plants,
W73-13431 5D

HEAT RESISTANCE
Low-Temperature Acclimation and the Seasonal Temperature Sensitivity of some Tropical Marine Fish,
W73-13453 5C

HEAT TRANSFER
Convective Instability in Liquid Pools Heated From Below,
W73-13442 8B

Thermally-Driven Linear Vortex,
W73-13443 8B

Heating and Cooling in Batch Processes,
W73-13448 5G

Dry Cooling Tower Uses Steel Structure,
W73-13451 5D

Effect of Noncondensables in Sea Water Evaporators,
W73-13463 3E

Research Needs on Waste Heat Transfer from Large Sources into the Environment.
W73-13473 5G

HEATED EFFLUENTS
Flow Properties of Submerged Heated Effluents in a Waterway,
W73-13084 5B

HEATED WATER
Flow Properties of Submerged Heated Effluents in a Waterway,
W73-13084 5B

Change in Feeding and Body Condition of Brown Bullheads Overwintering in the Heated Effluent of a Power Plant,
W73-13430 5C

Mariculture Comes of Age,
W73-13452 8I

Warm Water Advection in the Southern Beaufort Sea August-September 1971,
W73-13466 2E

HEAVY METALS
Separation of Manganese, Iron, Cobalt, Nickel, Copper, Zinc and Cadmium by Reversed-Phase Chromatography Using Tri-N-Octylamine as the Stationary Phase and Applying a Gradient Elution Technique, (Extraktionschromatographische Trennung Von Mangan, Eisen, Kobalt, Nickel, Kupfer, Zink Und Cadmium Unter Verwendung Von Tri-n-Octylamin Als Stationare Phase Und Gradientelution),
W73-13234 5A

Gas Chromatography of Tl, Se, Te, Hg, As, Sb, Bi, Sn as Phenyl Compounds, (Gas-Chromatographie von Tl, Se, Te, Hg, As, Sb, Bi, Sn als Phenylverbindungen),
W73-13235 5A

Mass Spectrometric Determination of Diethyldithiocarbamates,
W73-13241 5A

Atomic Fluorescence Spectrometry with a Graphite Rod Atomizer and Thermostated Electrodeless Discharge Lamps,
W73-13260 5A

Analytical Applications of Polyamine-Polyurea Chelating Resins,
W73-13571 5A

HEAVY MINERALS
Heavy Mineral Concentrating Processes and Density/Shape/Size Equilibria in the Marine and Coastal Dune Sands of the Apalachicola, Florida, Region,
W73-13540 2L

Heavy Minerals of Horn Island, Northern Gulf of Mexico,
W73-13541 2J

HELE-SHAW MODELS
Viscous Finger Wavelength Degeneration in Hele-Shaw Models,
W73-13375 2F

HELMINTH
Helminth Parasites of Four Species of Sunfishes (Centrarchidae) From Lake Wilgreen in Kentucky,
W73-13268 2I

On the Helminth Fauna of Fishes in the Small Danube (In Czech),
W73-13626 2I

HEMICRYPTOPHYTES
Water and Photosynthesis Relations of Desert Plants in the Mauritanian Sahara: III. Small Shrubs: Hemicryptophytes and Grasses (In German),
W73-13633 2I

HERPES-TYPE VIRUS
Oyster Herpes-Type Virus,
W73-13437 5C

HETEROCHEILIDAE
Parasites of Common Fishes from Iraq with Special Reference to Larval Form of Contracaecum (Nematoda:Heterocheilidae),
W73-13620 5C

HETEROTROPHY
Glucose Flux at the Sediment-Water Interface of Toronto Harbour, Lake Ontario, With Reference to Pollution Stress,
W73-13236 5B

HIGHWAY ICING
Water Pollution and Associated Effects from Street Salting,
W73-13471 5B

HILSA-ILISHA
Study of Parasites in Fishes of the Sind River: I. Trematodes of Hilsa ilisha (Ham.),
W73-13634 5C

HIRUDINEA
The Geographic Distribution of Freshwater Hirudinoidea in Canada,
W73-13170 5B

HISTORIC FLOODS
Flood of March 19-20, 1970, Metropolitan Birmingham and Jefferson County, Alabama,
W73-13521 7C

HOT GRAPHITE ATOMIZER
The Determination of Molybdenum in Sea Water by Hot Graphite Atomic Absorption Spectrometry After Concentration on p-Aminobenzylcellulose or Chitosan,
W73-13199 5A

HUMAN POPULATION
Evaluation of Discontinuities in Regional Population Projections,
W73-13006 6B

HUMBOLDT RIVER BASIN (NEV)
Productivity of Tall Wheatgrass and Great Basin Wildrye Under Irrigation on a Greasewood-Rabbitbrush Range Site,
W73-13314 3B

HUMIDITY (SUBSTRATE)
Effect of Substrate Humidity Conditions on Lettuce and Spinach Mineral Nutrition. 1. Effect of Humidity on Plant Yield (In Russian),
W73-13635 3F

HUMUS
Contribution to the Study of the Condensation of Organic Compounds During Humus Formation in a Podzolic Environment (In French),
W73-13627 2I

HYDRAULIC CONDUCTIVITY
Influence of Surface Soil Conditions on Drying in Early Spring,
W73-13098 3F

Physical Problems and their Amelioration in Salty Soils,
W73-13308 2G

HYDRAULIC FRACTURING
Induction and Growth of Fractures in Hot Rock,
W73-13228 8H

HYDRAULIC MODELS
Viscous Finger Wavelength Degeneration in Hele-Shaw Models,
W73-13375 2F

HYDRAULICS
Hydrologic and Hydraulic Design under Uncertainties,
W73-13159 8B

HYDRILLA
Pathogenicity of Fungi and Bacteria from India to Hydrilla and Waterhyacinth,
W73-13502 5C

HYDROCARBONS
The Significance of Hydrocarbon Assimilation in Yeast Identification,
W73-13512 5A

HYDROELECTRIC POWER
Upper Mississippi River Comprehensive Basin Study, Appendix M--Power.
W73-13493 6B

HYDROGEN ION CONCENTRATION
Interacting Effects of pH, Temperature, and Salt Concentration on Growth and Survival of Vibrio Parahaemolyticus,
W73-13245 5C

Effect of pH Adjustment Upon Activated Carbon Adsorption of Dissolved Organics from Industrial Effluents,
W73-13646 5D

HYDROGEN PEROXIDE
Experimental Information for Substantiating the Maximal Permissible Concentration of Isopropylbenzol Hydrogen Peroxide in Bodies of Water (In Russian),
W73-13623 5B

HYDROGEOLOGY
Detection of Fresh Water Aquifers in the Glacial Deposits of Northwestern Missouri by Geoelectrical Methods,
W73-13213 4B

Relationship Between the Carbon Isotope Composition of Soil CO2 and Dissolved Carbonate Species in Groundwater,
W73-13360 2K

Groundwater Hydrology of Prairie Potholes in North Dakota,
W73-13383 2F

Upper Mississippi Comprehensive Basin Study, Appendix E--Ground Water and Geology.
W73-13485 6B

Map Showing Ranges in Probable Maximum Well Yield from Water-Bearing Rocks in the San Francisco Bay Region, California,
W73-13519 7C

HYDROLOGIC BUDGET
Water and Land Resources in Eden Valley, Wyoming,
W73-13044 3F

Dew: An Addition to the Hydrologic Balance of Douglas Fir,
W73-13366 2I

HYDROLOGIC DATA
A Procedure for Assessing Water Resources for Urban Planning,
W73-13035 6A

Water Resources Data for Texas, 1972: Part 1, Surface Water Records.
W73-13069 7C

Problems of Analytical Methods in Hydrologic Data Collections,
W73-13135 7C

Natural Regime Hydrological Network Planning, A Methodological Discussion,
W73-13136 6A

Uncertainty in the Return Period of Maximum Events: A Bayesian Approach,
W73-13158 2B

Streamflow Data Usage in Wyoming,
W73-13306 7C

YDROLOGIC MODELS
Simulation of Coupled Leaky Aquifers and Surface-Water System,
W73-13014 2A

YDROLOGIC PROPERTIES
Physical Problems and their Amelioration in Salty Soils,
W73-13308 2G

YDROLOGIC RESPONSE FUNCTION
Hydrologic Response of Massachusetts Watersheds,
W73-13034 2A

YDROLOGIC SYSTEMS
Natural Regime Hydrological Network Planning, A Methodological Discussion,
W73-13136 6A

Treatment of Some of the Uncertainties Encountered in the Conduct of Hydrologic Cost-Effectiveness Evaluations,
W73-13154 6B

YDROLOGY
Loss of Information by Discretizing Hydrologic Series,
W73-13075 7A

Computer Programs in Hydrology,
W73-13076 7C

International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol. II.
W73-13134 4A

'Extended-Range' Meteorological Forecasts Applied to Multi-Reservoir Management Decisions,
W73-13139 2A

Concerning the Calculation of Level Veriation of Cutoff Water Balance,
W73-13163 4A

Characteristics of the Hydrologic Regimen of the Koksu River in 1970 (Osobennosti gidrologicheskogo rezhima r. Koksu v 1970 g.),
W73-13354 2E

Upper Mississippi Comprehensive Basin Study, Appendix D--Surface Water Hydrology.
W73-13484 6B

YDROPHILIC VEGETATION
Ecologic Observations on the Hydrophilic Vegetation of a Small Lake of Mount Fumaiolo (Apennines of Romagna), (In Italian),
W73-13384 2H

YDROPHOBIC SUBSTANCES
Water Pollution and Associated Effects from Street Salting,
W73-13471 5B

ELAND
Grass and Grass Utilization in Iceland,
W73-13510 4A

AHO
High-Lift Pumping and the Impact Upon Economic Development of Desert Land in Idaho,
W73-13027 3F

Evaluation of Techniques for Determining Average Precipitation in Semiarid Valleys of Idaho,
W73-13028 2B

Magnitude and Frequency of Floods in Small Drainage Basins in Idaho--A Design Method,
W73-13208 4A

Methods for Seeding Three Perennial Wheatgrasses on Cheatgrass Ranges in Southern Idaho,
W73-13319 4A

ILLINOIS
Sulfur Budget of Lake Shelbyville, Illinois, and the Effects of Sulfides Upon Chaoborus,
W73-13005 5B

Establishment of Invertebrate Communities on Log Substrates in the Kaskaskia River, Illinois,
W73-13508 5C

IMMOBILIZED ENZYME ELECTRODES
Enzyme Electrodes,
W73-13266 5A

IMPACT (RAINFALL)
A Numerical and Similarity Analysis of Infiltration Into Crusted Soils,
W73-13379 2G

IMPOUNDMENTS
Reactions of Canada Geese to Reservoir Impoundment on the Snake River in Washington,
W73-13082 6G

INDIA
Phytoplankton Population Dynamics and Distribution in Two Adjoining Lakes in Srinagar: I. Macroflora in Relation to Phytoplankton,
W73-13096 2H

A Study of the Blue-Green Algae From Paddy Field Soils of India,
W73-13498 5C

Pathogenicity of Fungi and Bacteria from India to Hydrilla and Waterhyacinth,
W73-13502 5C

INDIA (PUNJAB)
Pedogenic Calcite Accumulation in Arid and Semiarid Regions of the Indo-Gangetic Alluvial Plain of Erst-While Punjab (India)--Their Morphology and Origin,
W73-13311 2G

INDIA (TARAPUR)
Dietary Intake of Cobalt by the Adult Population of Tarapur,
W73-13426 5B

INDUSTRIAL PLANTS
Preoperational Cleaning of High Pressure Steam Systems,
W73-13444 3E

INDUSTRIAL WASTES
Cost of Waste Water Pollution Abatement in Poultry Processing and Rendering Plants in Georgia,
W73-13003 5D

Mercury Contamination of Fish in Northwestern Ontario,
W73-13287 5C

Solid Waste Disposal and Water Purification Method and Apparatus,
W73-13320 5D

Process for the Reduction of the Biochemical Oxygen Demand of Sewage, and for the Recovery of the Inherent Protein,
W73-13334 5D

The Application of Modern Solvent Extraction Techniques to the Removal of Trace Quantities of Toxic Substances From Industrial Effluents,
W73-13422 5D

Effect of pH Adjustment Upon Activated Carbon Adsorption of Dissolved Organics from Industrial Effluents,
W73-13646 5D

INDUSTRIAL WATER
Public and Industrial Water Supplies in Northern Mississippi,
W73-13042 6D

Effect of Waste Water from the Astrakhan Cellulose-Pasteboard Plant on Soil Properties,
W73-13315 5D

Water Requirements of the Petroleum Refining Industry,
W73-13561 3E

On Bacterial Aftergrowth in Drinking and Industrial Water: I. The Influence of Ion-Exchange Plants (In German),
W73-13629 5F

INDUSTRIES
Upper Mississippi River Comprehensive Basin Study, Appendix M--Power.
W73-13493 6B

INERT GASES
Analysis of Organic Constituents Present in Drinking Water,
W73-13240 5A

INFANT DISEASES
Results of Drinking Water Testing in the Szczecin Province Area Undertaken as Prophylactic Measure Against Alimentary Poisoning of Infants, (In Polish),
W73-13581 5A

INFILTRATION
Note on the Infiltration Advance Front from Border Irrigation,
W73-13371 2G

Viscous Finger Wavelength Degeneration in Hele-Shaw Models,
W73-13375 2F

A Numerical and Similarity Analysis of Infiltration Into Crusted Soils,
W73-13379 2G

INFILTRATION RATES
Prairie Sandreed (Calamovilfa longifolia): Water Infiltration and Use,
W73-13312 2I

INFORMATION LOSS
Loss of Information by Discretizing Hydrologic Series,
W73-13075 7A

INHIBITORS
Influence of Phenol and Temperature on the Respiration of a Freshwater Snail Helisoma Trivolvis,
W73-13454 5C

INJECTION WELLS
Clogging in Simulated Glacial Aquifers Due to Artificial Recharge,
W73-13374 4B

Preliminary Report on the Disposal of Oil-Field Brines in the Ritz-Canton Oil Field, McPherson County, Kansas,
W73-13564 5G

INLAND WATERWAYS
Upper Mississippi River Comprehensive Basin Study, Appendix J--Navigation.
W73-13490 6B

INPUT-OUTPUT ANALYSIS
Determination of Optimal Multiple Uses of a Small Water Resource,
W73-13009 6A

INSECTICIDES
Pesticides, Pollution, and Food Supply,
W73-13104 5G

Effect of the Rate of Application and the Volume of Applied Water on the Rate of Mobility of Certain Insecticides in Clay Soil,
W73-13579 5B

INSECTS
Distortion of Mirex Residues in Insects Owing to Use of Isopropyl Alcohol as a Collection Solvent,
W73-13274 5A

INSTITUTIONAL CONSTRAINTS
Institutional Requirements for Optimal Water Quality Management in Arid Urban Areas,
W73-13002 5G

Attitudes, Values, and Perceptions in Water Resource Decision-making Within a Metropolitan Area,
W73-13008 6B

INSTRUMENTATION
Errors of Measurement, Precision, Accuracy and the Statistical Comparison of Measuring Instruments,
W73-13194 7A

Improved Water Analysis Kit,
W73-13297 7B

Automated Water Monitoring Instrument for Phosphorus Contents,
W73-13470 5A

INTERSTATE COMMISSIONS
Pollution Abatement Programs in the Delaware River Estuary,
W73-13164 5G

INTESTINAL INFECTION
Intestinal Infection Carrier Survey in Diyarbakir: I. (In Turkish),
W73-13631 5C

INTESTINAL INFECTIONS
The Effect of the Water Factor in Spreading Intestinal Infections, (In Russian),
W73-13583 5C

INVASION
The Plant Ecology of Utah's Desert Rangelands,
W73-13310 2I

INVERTEBRATE DRIFT
Some Ecological Relationships of the Invertebrate Drift in Praters Creek, Pickens County, South Carolina,
W73-13107 2I

INVERTEBRATES
Influence of Phenol and Temperature on the Respiration of a Freshwater Snail Helisoma Trivolvis,
W73-13454 5C

Establishment of Invertebrate Communities on Log Substrates in the Kaskaskia River, Illinois,
W73-13508 5C

IODINE
Atomic Emission Spectrometry with an Induction-Coupled High-Frequency Plasma Source. The Determination of Iodine, Mercury, Arsenic and Selenium,
W73-13254 5A

IODINE RADIOISOTOPES
Soil Contamination. 2. Penetration of Radioactive Ions Present in Solutions Dumped on the Surface (Contamination Des Sols. Comportement Des Ions Radioactifs Dans Les Sols Non Stures),
W73-13417 5B

ION EXCHANGE
Chromatography of 48 Metal Ions on Stannic Arsenate and Plain Papers in Butanol-Nitric Acid Media,
W73-13281 5A

On Bacterial Aftergrowth in Drinking and Industrial Water: I. The Influence of Ion-Exchange Plants (In German),
W73-13629 5F

ION EXCHANGE RESINS
Analytical Applications of Polyamine-Polyurea Chelating Resins,
W73-13571 5A

ION SELECTIVE ELECTRODES
A Potassium-Selective Silicone-Rubber Membrane Electrode Based on a Neutral Carrier,
W73-13185 5A

Ion-Selective Carbon-Paste Electrodes for Halides and Silver (I) Ions,
W73-13187 5A

The Calibration and Response of Ion-Selective Electrodes at Low Concentrations of Primary Ions,
W73-13188 2K

Recent Results on the Dynamic Response of Precipitate-Based Ion-Selective Electrodes,

W73-13434 2H

Water: Examination, Assessment, Conditioning, Chemistry, Bacteriology, Biology,
W73-13573 5A

LAKE
The Seasonal Cycle of Pheopigments in Lake Ontario with Particular Emphasis on the Role of Zooplankton Grazing,
W73-13572 5C

LAKE BAYKAL
Use of Computers to Compute Unsteady Wind Currents in Bodies of Water as Illustrated by Lake Baykal (Primeneniye EVM dlya rascheta neustanovivshikhsya vetrovykh techeniy v vodoyemakh (na primere oz. Baykal)),
W73-13053 2H

LAKE CHAD
Nature of the Bottom and Distribution of Benthic Organisms in the Bol Region (Eastern Archipelago of Lake Chad),
W73-13618 2H

LAKE GENEVA
Levels of Mercury in the Sediments of some Swiss Lakes, Including Lake Geneva and the Rhone River,
W73-13617 5B

LAKE HAVASU (ARIZ)
Proposed Central Arizona Project (Final Environmental Statement). Available from the National Technical Information Service as EIS-AZ-72-5357-F1. Bureau of Reclamation, Boulder City, Nevada. (FES 72-35) Septem ber 1972, 597 p. Maps. 203 ref.
W73-13552 4A

LAKE LERE (CHAD)
Hydrobiological Investigation of Lake Lere and Neighboring Ponds: II. Rotifera,
W73-13636 2H

LAKE MICHIGAN
Drogue Measurements of the Circulation in Grand Traverse Bay, Lake Michigan,
W73-13033 2H

LAKE ONTARIO
Glucose Flux at the Sediment-Water Interface of Toronto Harbour, Lake Ontario, With Reference to Pollution Stress,
W73-13236 5B

Sulphate Deposition by Precipitation Into Lake Ontario,
W73-13270 5B

LAKE SEDIMENTS
Fossil Pigments in the Surface Sediments of a Meromictic Lake,
W73-13099 5B

Distribution and Background Levels of Mercury in Sediment Cores From Selected Wisconsin Lakes,
W73-13264 5B

Methylmercury: Bacterial Degradation in Lake Sediments,
W73-13267 5B

The Occurrence and Distribution of Mercury in the Sediments of Petit Lac (Western Lake Geneva),
W73-13588 5B

LAKE SEVAN (USSR)
Parasite Fauna and Seasonal Contamination of Coregonus Lavaretis in Lake Sevan,
W73-13400 2H

LAKE SHELBYVILLE (ILL)
Sulfur Budget of Lake Shelbyville, Illinois, and the Effects of Sulfides Upon Chaoborus,
W73-13005 5B

LAKE SUPERIOR
The Effects of Enrichment on Lake Superior Periphyton,
W73-13011 5C

The Fall Overturn and Winter Cooling in Lake Superior,
W73-13059 2H

Modelling the Regulation of Lake Superior under Uncertainty of Future Water Supplies,
W73-13140 4A

LAKE TRAVIS (TEX)
The Effects of Several Weather Disturbances on the Seiches in Lake Travis, Texas,
W73-13060 2H

LAKES
Attitudes of Riparians Towards Their Lake Environments: A Study of Lake Wyola and Damon Pond, Massachusetts,
W73-13007 6A

Use of Computers to Compute Unsteady Wind Currents in Bodies of Water as Illustrated by Lake Baykal (Primeneniye EVM dlya rascheta neustanovivshikhsya vetrovykh techeniy v vodoyemakh (na primere oz. Baykal)),
W73-13053 2H

The Effects of Several Weather Disturbances on the Seiches in Lake Travis, Texas,
W73-13060 2H

Network Density of Temperature Profile Stations and its Influence on the Accuracy of Lake Evaporation Calculations,
W73-13365 2D

Groundwater Hydrology of Prairie Potholes in North Dakota,
W73-13383 2F

LAND
Dry Farming: Uncertainty in Land and Water Productivity,
W73-13160 3F

LAND DEVELOPMENT
Environmental Protection Through Public and Private Development Controls,
W73-13025 5G

High-Lift Pumping and the Impact Upon Economic Development of Desert Land in Idaho,
W73-13027 3F

Economic Criteria for Decisions on Preservation and Use of Inland Wetlands in Massachusetts,
W73-13518 6B

LAND MANAGEMENT
Environmental Application of Remote Sensing Methods to Coastal Zone Land Use and Marine Resource Mnagement,
W73-13210 2L

Upper Mississippi River Comprehensive Basin Study, Appendix Q--Framework for Development.
W73-13497 6B

LAND RESOURCES
Water and Land Resources in Eden Valley, Wyoming,
W73-13044 3F

LAND SUBSIDENCE
Pollution of Karst Aquifers,
W73-13203 5B

Subsidence of the Venice Area During the Past 40,000 Yr,
W73-13526 2F

LAND USE
Water and Land Resources in Eden Valley, Wyoming,
W73-13044 3F

Environmental Application of Remote Sensing Methods to Coastal Zone Land Use and Marine Resource Mnagement,
W73-13210 2L

Upper Mississippi River Comprehensive Basin Study, Appendix K--Recreation.
W73-13491 6B

The President's 1973 Environmental Program.
W73-13528 6G

LAND USE CONTROLS
Environmental Protection Through Public and Private Development Controls,
W73-13025 5G

LANDSCAPE ECOLOGY
Studies of Landscape Ecology of the Natural Protection Area 'Entenfang' Near Wesseling,
W73-13388 2I

LARGEMOUTH BASS
Effects of Incubation Temperature on Survival of Largemouth Bass Eggs,
W73-13080 5C

Food of Largemouth Bass (Micropterus Salmoides) from a South Carolina Reservoir Receiving Heated Effluent,
W73-13083 5C

LARVAE
Ecology of Two Related Species of Caddis Fly Larvae in the Organic Substrates of a Woodland Stream,
W73-13286 5B

Laboratory Observations on the Early Growth of the Abalone, Haliotis Sorenseni, and the Effect of Temperature on Larval Development and Settling Success,
W73-13428 5C

LEACHING
Simultaneous Transport of Solutes and Water Under Transient Unsaturated Flow Conditions
W73-13380 2G

Irrigation Management for Control of Quality of Irrigation Return Flow,
W73-13469 5G

Effects of Phosphorus Application Rate, Soil Properties, and Leaching Mode on P-32 Movement in Soil Columns,
W73-13553 5B

LEAD
Aquatic Organisms and Heavy Metals in Missouri's New Lead Belt,
W73-13037 5C

LEAD RADIOISOTOPES
A Simultaneous Determination of Lead-210 and Polonium-210 in Sea Water,
W73-13184 5A

LEAKAGE
Feasibility of Plastic Foam Plugs for Sealing Leaking Chemical Containers,
W73-13019 5G

LEAKY AQUIFERS
Simulation of Coupled Leaky Aquifers and Surface-Water System,
W73-13014 2F

Integrodifferential Equations for Systems of Leaky Aquifers and Applications: 1. The Nature of Approximate Theories,
W73-13378 2F

LEAVES
Contributions of Allochthonous Detritus to the Energy Regime of Doe Run, Meade County, Kentucky,
W73-13056 5B

State of Plastid Pigments in Leaves of Essential-Oil-Bearing Plants Under Different Water Supplies, (In Russian),
W73-13575 2I

LEBISTES-RETICULATUS
Ancyrocephalus Dyki N. SP. (Monogenoidea Dactylogyridae) on the Gills of Lebistes Reticulatus,
W73-13589 5C

LEECHES
The Geographic Distribution of Freshwater Hirudinoidea in Canada,
W73-13170 2H

EGAL ASPECTS
A Decade of Judicial Developments and Changes in Colorado Water Law: 1960-1970,
W73-13070 6E

EGISLATION
An Act Prohibiting the Pollution Discoloration, Contamination, Clogging, or Diversion of Public Streams.
W73-13650 6E

ETTUCE
Effect of Substrate Humidity Conditions on Lettuce and Spinach Mineral Nutrition. 1. Effect of Humidity on Plant Yield (In Russian),
W73-13635 3F

ICHENS
Data on the Water Balance of Some Xerothermic Terrestrial Lichens,
W73-13397 2I

IFE CYCLES
Energy Flow in a Woodland Stream Ecosystem: II. The Taxonomic Composition and Phenology of the Chironomidae as Determined by the Collection of Pupal Exuviae,
W73-13509 5C

IGHT INTENSITY
The Interaction of Light Intensity and DDT Concentration Upon the Marine Diatom, Nitzschia delicatissima Cleve,
W73-13500 5C

IGNOSULFONATES
Effect of Calcium Lignosulfonate on Properties of Concrete at Early Ages,
W73-13644 5D

INEAR ALKYLATE SULFONATES
An Improved Method for the Analysis of Linear Alkylate Sulfonate,
W73-13643 5A

INEAR PROGRAMMING
A Minimum Cost Water Distribution Network,
W73-13071 4A

The Linear Decision Rule in Reservoir Management and Design, 3, Direct Capacity Determination and Intraseason Constraints,
W73-13138 4A

Estimating Benefits to Improved Seasonal Water Supply Forecasts: A Case Study of Irrigation Benefits,
W73-13143 3F

NESVILLE CREEK
Energy Flow in a Woodland Stream Ecosystem: II. The Taxonomic Composition and Phenology of the Chironomidae as Determined by the Collection of Pupal Exuviae,
W73-13509 5C

PIDS
Residues of DDT in Cod from Norwegian Fjords,
W73-13249 5A

An Isolation and Cleanup Procedure for Low Levels of Organochlorine Pesticide Residues in Fats and Oils,
W73-13284 5A

QUD CHROMATOGRAPHY
Chromatographic Separation of Phenols Using an Acrylic Resin,
W73-13166 5A

LIQUID FLOW RATES
Continuous Bubble Fractionation: Part III, Experimental Evaluation of Flow Parameters,
W73-13641 5D

LIQUID WASTES
Perforated Tube Module for Liquid Treatment,
W73-13325 5D

Method for Efficiently Separating Slurry-State Liquid into Solid Part and Liquid Part and an Apparatus Therefor,
W73-13330 5D

LITTER FALL
Nutrient Content of Litter Fall on the Hubbard Brook Experimental Forest, New Hampshire,
W73-13100 2K

LIVER
Residues of DDT in Cod from Norwegian Fjords,
W73-13249 5A

LIVESTOCK
Salt and Meal-Salt Help Distribute Cattle use on Semidesert Range,
W73-13317 3F

LLYN CELYN RESERVOIR (NORTH WALES)
The Sensitivity of Return Periods to Variations in Retention Levels for Different Definitions of Shortage,
W73-13162 4A

LOBSTERS
Interaction Between Marine Organisms and Oil Pollution,
W73-13023 5C

LOCATION THEORY
The Impact of Water Resources on the Location of Economic Activities,
W73-13149 6D

LOGGING (RECORDING)
A Periscope for the Study of Borehole Walls, and its Use in Ground-Water Studies in Niagara County, New York,
W73-13555 4B

LOGS
Establishment of Invertebrate Communities on Log Substrates in the Kaskaskia River, Illinois,
W73-13508 5C

LONG-TERM PLANNING
A Report on Corps of Engineers Research on the Management of Uncertainty in Water Resources Planning,
W73-13155 6B

LOUISIANA
Problems of Water Resource Development in the Gulf Coast Estuarine Zone,
W73-13152 2L

Estimating Water Quality from Electrical Logs,
W73-13556 4B

LUCERNE CLONE
Contents of Trace Elements in Lucerne (Medicago Varia Mart) in Relation to Growth, Development and Weather Conditions in 3 Years of Experiment, (In German),
W73-13396 5B

MACROINVERTEBRATES
Benthic Macroinvertebrate Community Structure in a Great Plains Stream Receiving Feedlot Runoff,
W73-13180 5C

MADAGASCAR
Phytosociological Study of the Mangroves of the Tulear Region (Madagascar): I. The Mangrove Trees of Sarodrano and Tulear (In French),
W73-13632 2I

MAGNESIUM
Complexes Affecting the Solubility of Calcium Carbonate in Water,
W73-13004 2H

Hydrological Chemical and Physical Investigations on the Adige River at Boara Pisani. June 1968-June 1970,
W73-13596 2K

Hydrological, Chemical and Physical Investigations on the Po River at Polesella: June 1968-June 1970,
W73-13598 2K

MAGNESIUM SALTS
Materials for Hygienic Assessment of Salt Composition in Drinking Water: VI. Effect of Consumption of Magnesium Salts with Drinking Water on Ossification Processes in Growing Animals,
W73-13630 5C

MAGNETIC STUDIES
Magnetic Treatment of Water.
W73-13544 5F

MAGNETIC TREATMENT (WATER)
Magnetic Treatment of Water.
W73-13544 5F

MAINE
Utilization of the Crayfish Orconectes Limosus as Forage by White Perch (Morone Americana) in a Maine Lake,
W73-13106 2H

MAINE (SCHOODIC LAKE)
Effects of DDT Upon Salmon From Schoodic Lake, Maine,
W73-13120 5C

MALARIA TRANSMISSION
The Anopheles Gambiae Complex and Malaria Transmission Around Kisumu, Kenya,
W73-13386 5C

MALATHION
Avoidance of Pesticides by Grass Shrimp (Palaemonetes pugio),
W73-13173 5C

Collaborative Study of the Nonaqueous Copper Colorimetric and Silver Titrimetric Methods for the Determination of Malathion in Technical Grade Malathion and in Malathion Formulation,
W73-13283 5A

MANAGEMENT
International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol. II.
W73-13134 4A

Climatic Uncertainty Effects on Management and Design of Reservoir-Irrigation Systems,
W73-13137 3F

The Linear Decision Rule in Reservoir Management and Design, 3, Direct Capacity Determination and Intraseason Constraints,
W73-13138 4A

MANAGEMENT

'Extended-Range' Meteorological Forecasts Applied to Multi-Reservoir Management Decisions,
W73-13139 2A

Reservoir Management: Optimal Pricing and Rationing Policies under Uncertainty,
W73-13141 4A

Reliability: A New Parameter in Urban Water Quality Management,
W73-13156 5D

Upper Mississippi River Comprehensive Basin Study, Appendix Q--Framework for Development.
W73-13497 6B

An Overview of Water Management Problems,
W73-13551 5G

MANGANESE

Separation of Manganese, Iron, Cobalt, Nickel, Copper, Zinc and Cadmium by Reversed-Phase Chromatography Using Tri-N-Octylamine as the Stationary Phase and Applying a Gradient Elution Technique, (Extraktionschromatographische Trennung Von Mangan, Eisen, Kobalt, Nickel, Kupfer, Zink Und Cadmium Unter Verwendung Von Tri-n-Octylamin Als Stationare Phase Und Gradientelution),
W73-13234 5A

Solubility of Manganese in the Presence of Soil Chemicals,
W73-13645 5B

MANGROVES

Phytosociological Study of the Mangroves of the Tulear Region (Madagascar): I. The Mangrove Trees of Sarodrano and Tulear (In French),
W73-13632 2I

MANOMETER

Improved Mercury Well for Multiple Tensiometer Systems,
W73-13523 7B

MANURES

Description and Use of an Underwater Television System on the Atlantic Continental Shelf,
W73-13559 7B

Effect on Wheat Yield and Nitrogen Uptake from Manures Made from Spent-Slurry,
W73-13601 3F

MAPS

Map Showing Ranges in Probable Maximum Well Yield from Water-Bearing Rocks in the San Francisco Bay Region, California,
W73-13519 7C

Maps Showing Areas in the San Francisco Bay Region where Nitrate, Boron, and Dissolved Solids in Ground Water May Influence Local or Regional Development,
W73-13520 7C

Flood of March 19-20, 1970, Metropolitan Birmingham and Jefferson County, Alabama,
W73-13521 7C

MARGIN OF SAFETY

The Margin of Safety for Compensating Losses Due to Uncertainties in Hydrological Statistics,
W73-13157 6B

MARINE ALGAE

Amchitka Bioenvironmental Program. Research Program on Marine Ecology, Amchitka Island, Alaska, July 1, 1971-June 30, 1972,
W73-13405 5C

MARINE ANIMALS

Iron-55 in the Human Populations of the World.
W73-13347 5B

MARINE BACTERIA

Marine Microbiology, Five-Year Progress Report, 1967-1972,
W73-13339 5A

MARINE ENVIRONMENT

A Rugged Silver-Silver Chloride Electrode for Field Use,
W73-13193 7B

MARINE FISH

Effects of Fixation on the Extraction of Dieldrin and p,p'-DDT from Muscle Tissue,
W73-13247 5A

Marine Sciences.
W73-13343 5B

Low-Temperature Acclimation and the Seasonal Temperature Sensitivity of some Tropical Marine Fish,
W73-13453 5C

Mercury Residues in Fish, 1969-1970 - National Pesticide Monitoring Program,
W73-13514 5A

MARINE FISHERIES

Amchitka Bioenvironmental Program. Research Program on Marine Ecology, Amchitka Island, Alaska, July 1, 1971-June 30, 1972,
W73-13405 5C

Mariculture Comes of Age,
W73-13452 8I

MARKING TECHNIQUES

Accumulation and Retention of 85Sr Marks by Young Largemouth Bass,
W73-13304 5C

MARKIV PROCESSES

A Stochastic Model for the Occurrence of Moisture in Vadose Media,
W73-13074 2G

MARKOV PROCESSES

Modelling the Regulation of Lake Superior under Uncertainty of Future Water Supplies,
W73-13140 4A

MARSH MANAGEMENT

A Comparison of Consumer's Surplus and Monopoly Revenue Estimates of Recreational Value for Two Utah Waterfowl Marshes,
W73-13018 6B

MASS SPECTROMETRY

A Method for the Detection of Traces of Nitrosamines Using Combined Gas Chromatography and Mass Spectrometry,
W73-13165 5A

Mass Spectrometric Determination of Diethyldithiocarbamates,
W73-13241 5A

Hydrocarbons from Sea Water,
W73-13257 5A

Determination of Nitrogen-15 by Chemical Ionization Mass Spectrometry,
W73-13280 5A

MASS TRANSFER

Simultaneous Transport of Solutes and Water Under Transient Unsaturated Flow Conditions,
W73-13380 2G

MASSACHUSETTS

Attitudes of Riparians Towards Their Lake Environments: A Study of Lake Wyola and Damon Pond, Massachusetts,
W73-13007 6A

Attitudes, Values, and Perceptions in Water Resource Decision-making Within a Metropolitan Area,
W73-13008 6B

Determination of Optimal Multiple Uses of a Small Water Resource,
W73-13009 6A

Hydrologic Response of Massachusetts Watersheds,
W73-13034 2E

Economic Criteria for Decisions on Preservation and Use of Inland Wetlands in Massachusetts,
W73-13518 6B

Effects of Highway De-Icing Salts on Groundwater and Water Supplies in Massachusetts,
W73-13525 5B

MATHEMATICAL MODELS

Computer Programs in Hydrology,
W73-13076

Influence of Soil Bulk Density and Matric Pressure on Soil Resistance to Penetration,
W73-13127

Bayesian Hydrologic Model Building,

The Calibration and Response of Ion-Selective Electrodes at Low Concentrations of Primary Ions,
W73-13188 2K

Gas Chromatography of Tl, Se, Te, Hg, As, Sb, Bi, Sn as Phenyl Compounds, (Gas-Chromatographie von Tl, Se, Te, Hg, As, Sb, Bi, Sn als Phenylverbindungen),
W73-13235 5A

Micromethod System for Identification of Anaerobic Bacteria,
W73-13242 5A

The Determination of All Detectable Elements in the Aquatic Plants of Linsley Pond and Cedar Lake (North Bradford, Connecticut) By X-Ray Emission and Optical Emission Spectroscopy,
W73-13261 5A

Kinetic Microdetermination of Mercury in Natural Waters and Biological Materials,
W73-13271 5A

Collaborative Study of the Nonaqueous Copper Colorimetric and Silver Titrimetric Methods for the Determination of Malathion in Technical Grade Malathion and in Malathion Formulation,
W73-13283 5A

Micro and Semimicro Determination of Thiols with Ion-Selective Electrodes,
W73-13289 5A

Water: Examination, Assessment, Conditioning, Chemistry, Bacteriology, Biology,
W73-13573 5A

Colorimetric Assay for Carboxymethyloxysuccinate, A New Detergent Builder,
W73-13637 5A

METHOXYCHLOR
The Effects of Methoxychlor on Fishes: I. Acute Toxicity and Breakdown Studies,
W73-13122 5C

METHYL MERCURY
Acute Effects of Administration of Methyl Mercuric Chloride on Tissues and Enzyme Activity in Channel Catfish (Ictalurus punctatus),
W73-13029 5C

METHYLATION
Methylmercury: Bacterial Degradation in Lake Sediments,
W73-13267 5B

METHYLCARBAMATE PESTICIDES
Gas Chromatographic Determination of Residues of Methylcarbamate Insecticides in Crops as Their 2,4-Dinitrophenyl Ether Derivatives,
W73-13282 5A

METHYLMERCURY
Toxicity of Methyl Mercury for Steelhead Trout Sperm,
W73-13250 5C

Methylmercury: Bacterial Degradation in Lak Sediments,
W73-13267 5

MEXICO
Effects on Cattle of Water Containing Dete gents,
W73-13602 5

MEXICO (CERRO PRIETO)
Geothermal Power Still Iffy,
W73-13433 3

MICHIGAN
Factors Controlling Copper (II) Concentratio in the Keweenaw Waterway,
W73-13010 1

Drogue Measurements of the Circulation Grand Traverse Bay, Lake Michigan,
W73-13033 2

Ground-Water Contamination and Legal Co trols in Michigan,
W73-13562

MICROBIAL DEGRADATION
Metabolism of Nitrilotriacetate by Cells Pseudomonas Species,
W73-13244

Metabolism of Endothall by Aquatic Micro ganisms,
W73-13258

Methylmercury: Bacterial Degradation in L Sediments,
W73-13267

Marine Microbiology, Five-Year Progress port, 1967-1972,
W73-13339

MICROMETHOD SYSTEM
Micromethod System for Identification Anaerobic Bacteria,
W73-13242

MICROORGANISMS
Requisites for Non-Polluting Microbicides,
W73-13476

MIDGES
Energy Flow in a Woodland Str Ecosystem: II. The Taxonomic Composi and Phenology of the Chironomidae as D mined by the Collection of Pupal Exuviae,
W73-13509

MIGRATION PATTERNS
Evaluation of Discontinuities in Regional P lation Projections,
W73-13006

MILK
Annual Scientific Report 1971 (Radioactive Non-Radioactive Contamination of the vironment and the Metabolism of Radioelements; Radiophysical Co Research on Body Contamination; V Disposal Research; N on-Radioactive Env mental Pollution).
W73-13349

MILLERS RIVER WATERSHED (MASS)
Determination of Optimal Multiple Uses Small Water Resource,
W73-13009

MINAS BASIN
Brief Field Guide to Intertidal Sedim Minas Basin, Nova Scotia,
W73-13204

MINE WASTES
Factors Controlling Copper (II) Concentrations in the Keweenaw Waterway,
W73-13010 5B

Aquatic Organisms and Heavy Metals in Missouri's New Lead Belt,
W73-13037 5C

MINE WATER
Treatment of Acid Mine Waters,
W73-13549 5F

MINERALOGY
Upper Mississippi River Comprehensive Basin Study, Appendix F--Mineral Resources.
W73-13486 6B

The Significance of the Solution of Feldspar in Porosity Development,
W73-13537 2J

Heavy Mineral Concentrating Processes and Density/Shape/Size Equilibria in the Marine and Coastal Dune Sands of the Apalachicola, Florida, Region,
W73-13540 2L

Heavy Minerals of Horn Island, Northern Gulf of Mexico,
W73-13541 2J

MINGECHAUR RESERVOIR (USSR)
Study of the Biology of Pelopia punctipennis Mg. (Chironomidae, Diptera) in the Mingechaur Reservoir (In Russian),
W73-13621 2H

MINING
Aquatic Organisms and Heavy Metals in Missouri's New Lead Belt,
W73-13037 5C

MINNESOTA
The Effects of Enrichment on Lake Superior Periphyton,
W73-13011 5C

Proceedings of Conference on Toward a Water Resources Research Plan for Minnesota.
W73-13303 6E

MIREX
Distortion of Mirex Residues in Insects Owing to Use of Isopropyl Alcohol as a Collection Solvent,
W73-13274 5A

MISSISSIPPI
Public and Industrial Water Supplies in Northern Mississippi,
W73-13042 6D

Heavy Minerals of Horn Island, Northern Gulf of Mexico,
W73-13541 2J

MISSISSIPPI RIVER
Problems of Water Resource Development in the Gulf Coast Estuarine Zone,
W73-13152 2L

MISSISSIPPI RIVER BASIN
Upper Mississippi River Comprehensive Basin Study: Volume I, Main Report.
W73-13480 6B

Upper Mississippi River Comprehensive Basin Study, Appendix A--History of Investigation.
W73-13481 6B

Upper Mississippi River Comprehensive Basin Study, Appendix B--Aesthetic and Cultural Values.
W73-13482 6B

Upper Mississippi River Comprehensive Basin Study, Appendix C--Climatology and Meteorology.
W73-13483 6B

Upper Mississippi Comprehensive Basin Study, Appendix D--Surface Water Hydrology.
W73-13484 6B

Upper Mississippi Comprehensive Basin Study, Appendix E--Ground Water and Geology.
W73-13485 6B

Upper Mississippi River Comprehensive Basin Study, Appendix F--Mineral Resources.
W73-13486 6B

Upper Mississippi River Comprehensive Basin Study, Appendix G--Fluvial Sediment.
W73-13487 6B

Upper Mississippi River Comprehensive Basin Study, Appendix H--Water Supply and Quality Control.
W73-13488 6B

Upper Mississippi River Comprehensive Basin Study, Appendix I--Flood Control.
W73-13489 6B

Upper Mississippi River Comprehensive Basin Study, Appendix J--Navigation.
W73-13490 6B

Upper Mississippi River Comprehensive Basin Study, Appendix K--Recreation.
W73-13491 6B

Upper Mississippi River Comprehensive Basin Study, Appendix L--Fish and Wildlife Resources.
W73-13492 6B

Upper Mississippi River Comprehensive Basin Study, Appendix M--Power.
W73-13493 6B

Upper Mississippi River Comprehensive Basin Study, Appendix N--Agriculture.
W73-13494 6B

Upper Mississippi River Comprehensive Basin Study, Appendix O--State and Federal Water Laws, Policies, and Programs.
W73-13495 6B

Upper Mississippi River Comprehensive Basin Study, Appendix P--Economic Base Study and Projections.
W73-13496 6B

Upper Mississippi River Comprehensive Basin Study, Appendix Q--Framework for Development.
W73-13497 6B

MISSOURI
Aquatic Organisms and Heavy Metals in Missouri's New Lead Belt,
W73-13037 5C

Detection of Fresh Water Aquifers in the Glacial Deposits of Northwestern Missouri by Geoelectrical Methods,
W73-13213 4B

MIXING
The Fall Overturn and Winter Cooling in Lake Superior,
W73-13059 2H

Process Design Manual for Phosphorus Removal,
W73-13129 5D

MOBILE BAY (ALA)
Extensive Oxygen Depletion in Mobile Bay, Alabama,
W73-13065 5C

MODEL BUILDING
Bayesian Hydrologic Model Building,
W73-13144 2A

MODEL STUDIES
A Stochastic Model for the Occurrence of Moisture in Vadose Media,
W73-13074 2G

Climatic Uncertainty Effects on Management and Design of Reservoir-Irrigation Systems,
W73-13137 3F

Survival of Salmonella Typhimurium in Animal Manure Disposal in a Model Oxidation Ditch,
W73-13253 5C

Viscous Finger Wavelength Degeneration in Hele-Shaw Models,
W73-13375 2F

Wind-Swept Water Surface in Laboratory Cooled by Applying Heat,
W73-13434 2H

Irrigation Management for Control of Quality of Irrigation Return Flow,
W73-13469 5G

The Use of Water Quality Simulation Models in the Analysis of the Thermal Effects Problem,
W73-13479 5B

Hydraulic Sand-Model Study of the Cyclic Flow of Salt Water in a Coastal Aquifer,
W73-13558 2L

MOISTURE AVAILABILITY
A Comparative Study of Soil Versus Follar Application of Ammonium Nitrate to Wheat under Different Moisture Regimes,
W73-13313 3F

MOISTURE STRESS
Effect of Plant Moisture Stress on Carbohydrate and Nitrogen Content of Big Sagebrush,
W73-13309 2I

MOLLUSKS
The Effect of Temperature on the Number of Circulating Hemocytes in the California Sea Hare, Aplysia California,
W73-13461 5C

MOLYBDENUM
The Determination of Molybdenum in Sea Water by Hot Graphite Atomic Absorption Spectrometry After Concentration on p-Aminobenzylcellulose or Chitosan,
W73-13199 5A

MONGOLIA
Water Reserve of Leaves of Desert-Steppe and Introduced Plants in the Gobi Desert of Mongolia, (In Russian),
W73-13574 2I

MONGOLIA

First Data on the Water Regime of Plants From Southern Mongolia, (In Russian),
W73-13607 2I

MONITORING

On Multidisciplinary Research on the Application of Remote Sensing to Water Resources Problems.
W73-13299 5A

Automated Water Monitoring Instrument for Phosphorus Contents,
W73-13470 5A

MONOGENEA

Aspina Trium Gallieni N. Sp. (Monogena, Polyopisthocotylea) Parasite of Strongylura Acus Lacepede 1803, (In French),
W73-13590 2I

MONOGENOIDEA

Ancyrocephalus Dyki N. SP. (Monogenoidea: Dactylogyridae) on the Gills of Lebistes Reticulatus,
W73-13589 2I

MONTE CARLO METHOD

Concerning the Calculation of Level Veriation of Cutoff Water Balance,
W73-13163 4A

Modified Monte Carlo Application to Groundwater Movement--The Simultaneity Procedures,
W73-13376 2F

MONTE CARLO METHODS

'Extended-Range' Meteorological Forecasts Applied to Multi-Reservoir Management Decisions,
W73-13139 2A

MORTALITY

Accumulation and Retention of 85Sr Marks by Young Largemouth Bass,
W73-13304 5C

MOSQUITOFISH

Epoxidation and Fate of (C-14)Aldrin in Insecticide-Resistant and Susceptible Populations of Mosquitofish (Gambusia affinis),
W73-13190 5B

MOUNTAIN WATERSHEDS

Yellowstone National Park, Baseline Water Quality Survey Report.
W73-13133 5B

MOUNTAINS

Calculation of Suspended-Sediment Transport by Mountain Streams (K voprosu o raschete transporta vzveshennykh nanosov gornymi rekami),
W73-13048 2J

MT. RUSHMORE NATIONAL MEMORIAL (S. DAK)

Water Resources and Geology of Mount Rushmore National Memorial, South Dakota,
W73-13522 2F

MULCH

Vertical Mulch Effects on Soil Water Storage,
W73-13436 2G

MULTI-RESERVOIR SYSTEMS

'Extended-Range' Meteorological Forecasts Applied to Multi-Reservoir Management Decisions,
W73-13139 2A

MULTIAQUIFER SYSTEMS

Simulation of Coupled Leaky Aquifers and Surface-Water System,
W73-13014 2A

MULTIELEMENTAL ANALYSIS

Atomic Fluorescence Spectrometry with a Graphite Rod Atomizer and Thermostated Electrodeless Discharge Lamps,
W73-13260 5A

MULTIPLE PURPOSE

Proposed Central Arizona Project (Final Environmental Statement). Available from the National Technical Information Service as EIS-AZ-72-5357-F1. Bureau of Reclamation, Boulder City, Nevada. (FES 72-35) Septem ber 1972, 597 p. Maps. 203 ref.
W73-13552 4A

MULTIPLE-PURPOSE RESERVOIRS

The Linear Decision Rule in Reservoir Management and Design, 3, Direct Capacity Determination and Intraseason Constraints,
W73-13138 4A

The Sensitivity of Return Periods to Variations in Retention Levels for Different Definitions of Shortage,
W73-13162 4A

MUNICIPAL WATER

Public and Industrial Water Supplies in Northern Mississippi,
W73-13042 6D

Reliability: A New Parameter in Urban Water Quality Management,
W73-13156 5D

MUSCLE

Geothermal Mercury Pollution in New Zealand,
W73-13175 5B

Effects of Fixation on the Extraction of Dieldrin and p,p'-DDT from Muscle Tissue,
W73-13247 5A

Residues of DDT in Cod from Norwegian Fjords,
W73-13249 5A

MYCOBACTERIUM

Differentiation of Mycobacterium tuberculosis from Other Mycobacteria by Susceptibility to Ethyl and Methyl Esters of p-Nitrobenzoic Acid,
W73-13513 5C

N-15

Determination of Nitrogen-15 by Chemical Ionization Mass Spectrometry,
W73-13280 5A

NAJAS GUADALUPENSIS

Cadmium Toxicity and Accumulation in Southern Naiad,
W73-13251 5C

NAMPA (IDAHO)

High-Lift Pumping and the Impact Upon Economic Development of Desert Land in Idaho,
W73-13027 3F

NARYN RIVER (USSR)

Some Characteristics of Modern Glaciers in the Naryn River Basin (Nekotoryye cherty sovremennogo oledeneniya basseyna r. Naryna),
W73-13358 2C

NATIONAL PARKS

Yellowstone National Park, Baseline Water Quality Survey Report.
W73-13133 5B

Water Resources and Geology of Mount Rushmore National Memorial, South Dakota,
W73-13522 2F

NATRON

Seasonal Variations in the Rotifer Population of the Natron Containing Waters of Kanem (Chad),
W73-13467 2H

NATURAL WATERS

A Simple Coulometric Method for the Determination of Chloride in Natural Water,
W73-13181 5A

NAVIGATION

Upper Mississippi River Comprehensive Basin Study, Appendix J--Navigation.
W73-13490 6B

NEBRASKA

Groundwater: From Windmills to Comprehensive Public Management,
W73-13505 6E

Rights to Nebraska Streamflows: An Historical Overview with Recommendations,
W73-13506 6E

NEMATODA

Parasites of Common Fishes from Iraq with Special Reference to Larval Form of Contracaecum (Nematoda:Heterocheilidae),
W73-13620 5C

NEMATODE

A New Nematode Species in Carp Waters of the West Regions of Ukraine,
W73-13624 5C

NEMATODES

Studies on the Interactions of Bacteria and Nematodes,
W73-13001 5C

A Simple Technique for Isolation of Pelodera Chitwoodi, a Bacteriophagous Nematode, from Soil,
W73-13501 5A

NEMATOLOGY

The Importance of Discoveries in Nematology to Human Welfare.
W73-13427 2I

NETWORK DESIGN

Data Acquisition Systems in Water Quality Management,
W73-13024 5G

NETWORKS

A Minimum Cost Water Distribution Network,
W73-13071 4A

Design of Optimal Water Distribution Networks Using Dynamic Programming,
W73-13072 4A

An Interactive Design System for Water Distribution Networks,
W73-13073 4A

Natural Regime Hydrological Network Planning, A Methodological Discussion,
W73-13136 6A

UTRALIZATION
Method for Treating Acid Water Containing Metallic Values,
W73-13335 5D

UTRON ACTIVATION ANALYSIS
n Situ Activation Analysis of Marine Sediments with Californium-252,
W73-13295 2K

he Role of Paper Mill Additives as Potential Stream Pollutants,
W73-13338 5B

ctivation Analysis of Trace Elements in ological Materials, (Analyse Par Activation e Mecroquantites D'Elements Dans Les ateriaux Biologique),
W73-13420 5A

TRON MOISTURE PROBE
se of a Neutron Moisture Probe to Determine e Storage Coefficient of an Unconfined quifer,
W73-13554 4B

ADA
ater levels and Spring Discharges for lected Wells and Springs in Nevada, 1966-69,
W73-13043 4B

oductivity of Tall Wheatgrass and Great sin Wildrye Under Irrigation on a easewood-Rabbitbrush Range Site,
W73-13314 3B

HAMPSHIRE
lal Marsh Ciliates (Protozoa): Morphology, ology, Systematics,
W73-13591 2H

HAMPSHIRE (HUBBARD BROOK EXP. EST)
trient Content of Litter Fall on the Hubbard ook Experimental Forest, New Hampshire,
W73-13100 2K

JERSEY
w Jersey Continental Shelf Near Bottom rrent Meter Records and Recent Sediment tivity,
W73-13543 2J

nual Report. 1971-1972. New Jersey Water Sources Research Institute.
W73-13545 9D

LEAD BELT (MO)
uatic Organisms and Heavy Metals in Missri's New Lead Belt,
W73-13037 5C

MEXICO
ulation of Coupled Leaky Aquifers and face-Water System,
W73-13014 2A

YORK
al Environmental Statement Related to the ntinuation of Construction of Unit 2 and the eration of Units 1 and 2 Millstone Nuclear wer Station.
W73-13411 5C

al Environmental Statement Related to Conction of Nine Mile Point Nuclear Station t 2.
W73-13413 5C

Maintenance of Great South Bay and Patchogue River, New York, Navigation Project (Final Environmental Statement).
W73-13524 8B

A Periscope for the Study of Borehole Walls, and its Use in Ground-Water Studies in Niagara County, New York,
W73-13555 4B

NEW ZEALAND
Geothermal Mercury Pollution in New Zealand,
W73-13175 5B

NEWPORT RIVER (NC)
A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W73-13298 5B

NICKEL
Separation of Manganese, Iron, Cobalt, Nickel, Copper, Zinc and Cadmium by Reversed-Phase Chromatography Using Tri-N-Octylamine as the Stationary Phase and Applying a Gradient Elution Technique, (Extraktionschromatographische Trennung Von Mangan, Eisen, Kobalt, Nickel, Kupfer, Zink Und Cadmium Unter Verwendung Von Tri-n-Octylamin Als Stationare Phase Und Gradientelution),
W73-13234 5A

NIGERIA (LAGOS LAGOON)
The Biology of the West African Shad Ethmalosa Fimbriata (Bowdich) in the Lagos Lagoon, Nigeria,
W73-13600 2H

NITRATES
The Effects of Enrichment on Lake Superior Periphyton,
W73-13011 5C

Isotophic Tracer Techniques for Identification of Sources of Nitrate Pollution,
W73-13201 5B

Marine Microbiology, Five-Year Progress Report, 1967-1972,
W73-13339 5A

On the Influence of Sodium on the Water Status of Sugar Beet,
W73-13393 3F

Selected Irrigation Return Flow Quality Abstracts 1970-1971, Second Annual Issue,
W73-13472 5G

NITRIFICATION
Nitrification and Denitrification - A Selected Bibliography,
W73-13085 5B

Activated Sludge Modifications for Enhancement of Trickling Filter Plant Performance. I. Design, Operation, and BOD Removal in the Units. II. Nitrification,
W73-13086 5D

NITRILOTRIACETIC ACID
Metabolism of Nitrilotriacetate by Cells of Pseudomonas Species,
W73-13244 5B

NITRITES
Marine Microbiology, Five-Year Progress Report, 1967-1972,
W73-13339 5A

NITRO SALICYLANILIDES
Comparative Toxicity of 29 Nitrosalicylanilides and Related Compounds to Eight Species of Fish,
W73-13288 5C

NITROBENZOATE
Differentiation of Mycobacterium tuberculosis from Other Mycobacteria by Susceptibility to Ethyl and Methyl Esters of p-Nitrobenzoic Acid,
W73-13513 5C

NITROGEN
Enzymatic NH3-N Determination: A Specific Method for the Determination of Ammonia in Water and Sediments,
W73-13068 5A

Nitrification and Denitrification - A Selected Bibliography,
W73-13085 5B

Inorganic Nitrogen Removal From Wastewater: Effect on Phytoplankton Growth in Coastal Marine Waters,
W73-13179 5C

Precise Shipboard Determination of Dissolved Nitrogen, Oxygen, Argon, and Total Inorganic Carbon by Gas Chromatography,
W73-13255 5A

Determination of Nitrogen-15 by Chemical Ionization Mass Spectrometry,
W73-13280 5A

Nitrogen Metabolism in the Sea.
W73-13292 5B

Effect of Plant Moisture Stress on Carbohydrate and Nitrogen Content of Big Sagebrush,
W73-13309 2I

Description and Use of an Underwater Television System on the Atlantic Continental Shelf,
W73-13559 7B

Effect of Tissue Hydration on Nitrogen Metabolism in Barley Leaves, (In Russian),
W73-13577 3F

Effect on Wheat Yield and Nitrogen Uptake from Manures Made from Spent-Slurry,
W73-13601 3F

NITROGEN BALANCE
Nitrogen Balance in Soil Columns Intermittently Flooded with Secondary Sewage Effluent,
W73-13116 5B

NITROGEN FIXING BACTERIA
Marine Microbiology, Five-Year Progress Report, 1967-1972,
W73-13339 5A

NITROPHENOL
Parathion Exposure Studies. A Gas Chromatographic Method for the Determination of Low Levels of p-Nitrophenol in Human and Animal Urine,
W73-13174 5A

NITROPHILOUS EDGE ASSOCIATIONS
Changes in Species Composition of Nitrophilous Edge Associations in Studeny and Rohacsky Valleys in the Liptauer Tatra,
W73-13608 2I

NITROSAMINES
A Method for the Detection of Traces of Nitrosamines Using Combined Gas Chromatography and Mass Spectrometry,
W73-13165 5A

NONCONDENSABLES
Effect of Noncondensables in Sea Water Evaporators,
W73-13463 3E

NONCONSUMPTIVE USE
A Comparison of Consumer's Surplus and Monopoly Revenue Estimates of Recreational Value for Two Utah Waterfowl Marshes,
W73-13018 6B

NORTH CAROLINA
Variations in Characteristics of Wastewater Influent at the Mason Farm Wastewater Treatment Plant, Chapel Hill, North Carolina,
W73-13087 5D

A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W73-13298 5B

NORTH DAKOTA
Groundwater Hydrology of Prairie Potholes in North Dakota,
W73-13383 2F

NORWAY
A Study of Sediment Transport in Norwegian Glacial Rivers, 1969,
W73-13026 2J

The Origin and Significance of Some Downcurrent-Dipping Cross-Stratified Sets,
W73-13538 2J

The Hippophae Rhamnoides Alluvial Forest at Leinora, Central Norway: A Phytosociological and Ecological Study,
W73-13594 2I

NORWAY (MESNA CATCHMENT)
A Comparison of the Zooplankton Communities in Seven Mountain Lakes Near Lillehammer, Norway (1896 and 1971),
W73-13117 5C

NUCLEAR EXPLOSIONS
Recovery of Geothermal Energy from Hot, Dry Rock with Nuclear Explosives,
W73-13226 8H

Explosive Stimulation of Hydrothermal Reservoirs,
W73-13227 8H

Environmental Aspects of Nuclear Stimulation,
W73-13230 8H

Corrosion and Scaling in Nuclear-Stimulated Geothermal Power Plants,
W73-13231 8H

Amchitka Bioenvironmental Program. Research Program on Marine Ecology, Amchitka Island, Alaska, July 1, 1971-June 30, 1972,
W73-13405 5C

Freshwater Vertebrate and Invertebrate Ecology of Amchitka Island. July 1, 1971-June 30, 1972,
W73-13406 5C

NUCLEAR MOISTURE METERS
Monitoring Snow Water Equivalent by Using Natural Soil Radioactivity,
W73-13382 2C

NUCLEAR POWER PLANTS
Ecological Comparisons of Thermally Affected Aquatic Environments,
W73-13439 5C

NUCLEAR POWERPLANTS
Final Environmental Statement Related to Operation of Surry Power Station Unit 1.
W73-13408 5C

Aquatic, Bioenvironmental Studies in the Columbia River at Hanford 1945-1971. A Bibliography with Abstracts,
W73-13409 5B

Final Environmental Statement Related to the St. Lucie Plant Unit No. 1.
W73-13410 5C

Final Environmental Statement Related to the Continuation of Construction of Unit 2 and the Operation of Units 1 and 2 Millstone Nuclear Power Station.
W73-13411 5C

Final Environmental Statement Related to the Construction of Susquehanna Steam Electric Station Units 1 and 2.
W73-13412 5C

Final Environmental Statement Related to Construction of Nine Mile Point Nuclear Station Unit 2.
W73-13413 5C

Treatment of Radioactive Steam-Generator Blowdown,
W73-13447 5D

NUCLEAR WASTES
Plutonium Studies.
W73-13344 5B

Annual Scientific Report 1971 (Radioactive and Non-Radioactive Contamination of the Environment and the Metabolism of Some Radioelements; Radiophysical Control; Research on Body Contamination; Waste Disposal Research; N on-Radioactive Environmental Pollution).
W73-13349 5B

Use of Hanford Waste Ponds by Waterfowl and Other Birds,
W73-13404 5C

Methodology for the Identification of a Biological Indicator in Radioecology: Example of CS137 and a Freshwater Mollusc Anodonta, (Methodologie Pour La Recherche D'un Indicateur Biologique En Radioecologie),
W73-13407 5A

Eighteenth Annual Conference on Bioassay, Environmental and Analytical Chemistry, Oct. 10-11, 1972, Program and Abstracts.
W73-13415 5A

Soil Contamination. 2. Penetration of Radioactive Ions Present in Solutions Dumped on the Surface (Contamination Des Sols. Comportement Des Ions Radioactifs Dans Les Sols Non Stures),
W73-13417 5B

Occurrence of SE75 and SN113 in Oysters,
W73-13424 5A

Dietary Intake of Cobalt by the Adult Popula tion of Tarapur,
W73-13426 5I

NUTRIENT FLUX
Glucose Flux at the Sediment-Water Interfac of Toronto Harbour, Lake Ontario, Wit Reference to Pollution Stress,
W73-13236 5I

NUTRIENT REMOVAL
Inorganic Nitrogen Removal From Wastewate Effect on Phytoplankton Growth in Coast Marine Waters,
W73-13179 5

Solid Waste Disposal and Water Purificatio Method and Apparatus,
W73-13320 5

NUTRIENT REQUIREMENTS
Slime Production by Pseudomonas Aeruginos II. A New Synthetic Medium and Cultural Co ditions Suitable for Slime Production by Pse domonas Aerginosa,
W73-13088

A Comparative Study of Soil Versus Follar A plication of Ammonium Nitrate to Wheat und Different Moisture Regimes,
W73-13313

The Influence of Environmental Factors on t Distribution of Freshwater Algae: An Expe mental Study. I. Introduction and the Influen of Calcium Concentration,
W73-13546

NUTRIENTS
The Effects of Enrichment on Lake Super Periphyton,
W73-13011

Contributions of Allochthonous Detritus to Energy Regime of Doe Run, Meade Coun Kentucky,
W73-13056

Nutrient Content of Litter Fall on the Hubb Brook Experimental Forest, New Hampshir
W73-13100

Hydrological Chemical and Physical Invest tions on the Adige River at Boara Pisani. J 1968-June 1970,

OCEAN CURRENTS
Warm Water Advection in the Southern B fort Sea August-September 1971,
W73-13466

OCEAN POLLUTION
A Literature Survey of Ocean Pollution,
W73-13211

OCEAN WAVES
Reconnaissance Survey of Hog Island, Prince Edward Island,
W73-13205 2J

A Note on Wind and Wave Conditions in the Southern Gulf of St. Lawrence,
W73-13207 2L

OCEANS
A Literature Survey of Ocean Pollution,
W73-13211 5B

Oceanic Sediments and Their Diagenesis: Some Examples From Deep-Sea Drilling,
W73-13542 2J

ODOR
A Little Phenol Stirs up a Lot of Public Relations,
W73-13550 5F

OHIO RIVER
Dynamic Cooling.
W73-13449 5B

OIL
Synergistic Bio-Effects of Oil and Irradiation in an Aquatic Organism, Taricha Granulosa,
W73-13248 5C

An Isolation and Cleanup Procedure for Low Levels of Organochlorine Pesticide Residues in Fats and Oils,
W73-13284 5A

OIL-BASED SOLUTIONS
Atomic Fluorescence Spectrometry with a Graphite Rod Atomizer and Thermostated Electrodeless Discharge Lamps,
W73-13260 5A

OIL BOOMS
Flexible Oil Boom for High Sea,
W73-13331 5G

OIL POLLUTION
Interaction Between Marine Organisms and Oil Pollution,
W73-13023 5C

Detecting and Measuring Oil on Water,
W73-13094 5A

Flexible Oil Boom for High Sea,
W73-13331 5G

Device for Fencing and Absorbing Contaminating Oil Spills on Water,
W73-13333 5G

Apparatus for Eliminating Oil Slicks from Large Bodies of Water,
W73-13337 5G

OIL SPILL RECOVERY
A Prototype High Seas Oil Recovery System: Phase I--System Development, Vol. III,
W73-13040 5G

OIL SPILLS
A Prototype High Seas Oil Recovery System: Phase I--System Development, Vol. III,
W73-13040 5G

Polarization: A Key to an Airborne Optical System for the Detection of Oil on Water,
W73-13167 5A

Flexible Oil Boom for High Sea,
W73-13331 5G

Device for Fencing and Absorbing Contaminating Oil Spills on Water,
W73-13333 5G

Apparatus for Eliminating Oil Slicks from Large Bodies of Water,
W73-13337 5G

OIL WASTES
Interaction Between Marine Organisms and Oil Pollution,
W73-13023 5C

OKLAHOMA
The Kinetics of NH4 Uptake by Ceratophyllum,
W73-13504 5C

ON-BOARD ANALYSIS
A Rugged Silver-Silver Chloride Electrode for Field Use,
W73-13193 7B

ON-SITE DATA COLLECTIONS
A Rugged Silver-Silver Chloride Electrode for Field Use,
W73-13193 7B

ON-SITE INVESTIGATIONS
In Situ Activation Analysis of Marine Sediments with Californium-252,
W73-13295 2K

Water: Examination, Assessment, Conditioning, Chemistry, Bacteriology, Biology,
W73-13573 5A

ON-SITE TESTS
Ecology of Two Related Species of Caddis Fly Larvae in the Organic Substrates of a Woodland Stream,
W73-13286 5B

Improved Water Analysis Kit,
W73-13297 7B

Treatment of Radioactive Steam-Generator Blowdown,
W73-13447 5D

OOZE DEPOSITS
Destruction of Organic Substance in Ooze Deposits, (In Russian),
W73-13584 5B

OPERATION AND MAINTENANCE
Preoperational Cleaning of High Pressure Steam Systems,
W73-13444 3E

Problems with Exchangers in Ethylene Plants,
W73-13465 8G

OPERATION REQUIREMENTS
Process Design Manual for Suspended Solids Removal.
W73-13130 5D

OPTICAL EMISSION SPECTROSCOPY
The Determination of All Detectable Elements in the Aquatic Plants of Linsley Pond and Cedar Lake (North Bradford, Connecticut) By X-Ray Emission and Optical Emission Spectroscopy,
W73-13261 5A

OPTICAL SYSTEMS
Polarization: A Key to an Airborne Optical System for the Detection of Oil on Water,
W73-13167 5A

OPTIMAL DEVELOPMENT PLANS
Determination of Optimal Multiple Uses of a Small Water Resource,
W73-13009 6A

OPTIMIZATION
Institutional Requirements for Optimal Water Quality Management in Arid Urban Areas,
W73-13002 5G

Design of Optimal Water Distribution Networks Using Dynamic Programming,
W73-13072 4A

Natural Regime Hydrological Network Planning, A Methodological Discussion,
W73-13136 6A

Modelling the Regulation of Lake Superior under Uncertainty of Future Water Supplies,
W73-13140 4A

Reservoir Management: Optimal Pricing and Rationing Policies under Uncertainty,
W73-13141 4A

Reliability: A New Parameter in Urban Water Quality Management,
W73-13156 5D

Optimal Design Strategy for Small Flood-Control Structures,
W73-13161 8B

OPTIMUM DEVELOPMENT PLANS
Subjective Planning: A Model for Water Resource Development,
W73-13150 6A

OREGON
Engineering Hydrology,
W73-13016 3B

Decision Making in Water Resource Allocation,
W73-13301 6B

OREGON (PRATT LAKE)
Gonad Maturation of Brook Trout (Salvelinus fontinalis) in a High Mountain Lake under a Modified Photoperiod,
W73-13128 2H

ORGANIC ACIDS
Solubility of Manganese in the Presence of Soil Chemicals,
W73-13645 5B

ORGANIC COMPOUNDS
Interaction Between Marine Organisms and Oil Pollution,
W73-13023 5C

Hydrocarbons in the Pelagic Sargassum Community,
W73-13172 5B

Analysis of Organic Constituents Present in Drinking Water,
W73-13240 5A

Hydrocarbons from Sea Water,
W73-13257 5A

Identification by Means of Retention Parameters,
W73-13511 5A

Contribution to the Study of the Condensation of Organic Compounds During Humus Formation in a Podzolic Environment (In French),
W73-13627 2I

ORGANIC DESTRUCTION
Destruction of Organic Substance in Ooze Deposits, (In Russian),
W73-13584 5B

ORGANIC LOADING
Variations in Characteristics of Wastewater Influent at the Mason Farm Wastewater Treatment Plant, Chapel Hill, North Carolina,
W73-13087 5D

ORGANIC MATTER
Interaction of Yellow Organic Acids with Calcium Carbonate in Freshwater,
W73-13058 5B

Size Classes of Organic Carbon in Seawater,
W73-13062 5B

Ecology of Two Related Species of Caddis Fly Larvae in the Organic Substrates of a Woodland Stream,
W73-13286 5B

ORGANIC SOLVENTS
Analysis of Organic Constituents Present in Drinking Water,
W73-13240 5A

ORGANOLEPTIC PROPERTIES
Experimental Information for Substantiating the Maximal Permissible Concentration of Isopropylbenzol Hydrogen Peroxide in Bodies of Water (In Russian),
W73-13623 5B

ORGANOMERCURY COMPOUNDS
Extraction and Gas Chromatographic Determination of Methyl, -Ethyl-, and Methoxyethylmercury (II) Halides,
W73-13182 5A

ORGANOMETALLICS
Gas Chromatography of Tl, Se, Te, Hg, As, Sb, Bi, Sn as Phenyl Compounds, (Gas-Chromatographie von Tl, Se, Te, Hg, As, Sb, Bi, Sn als Phenylverbindungen),
W73-13235 5A

ORTHOPHOSPHATES
Atomic Absorption Inhibition Titration of Orthophosphate and Polyphosphates,
W73-13198 5A

OSMOSIS
Postdepositional Osmotic Adjustments in Sediments from Soap Lake, Washington,
W73-13064 2J

OSSIFICATION
Materials for Hygienic Assessment of Salt Composition in Drinking Water: VI. Effect of Consumption of Magnesium Salts with Drinking Water on Ossification Processes in Growing Animals,
W73-13630 5C

OSTRACODS
SOND Cruise 1965: Factor and Cluster Analyses of the Plankton Results, A General Summary,
W73-13507 5A

OUT-MIGRATION
Evaluation of Discontinuities in Regional Population Projections,
W73-13006 6B

OWENS VALLEY (CALIF)
Ground Water Development and Management in the Owens Valley,
W73-13569 4B

OXIDATION
Study of Gamma Induced Low Temperature Oxidation of Textile Effluehnts,
W73-13022 5D

Process for Treating Septic Biological Wastes in Arctic Climates,
W73-13332 5D

Treatment of Complex Cyanide for Reuse or Disposal,
W73-13468 5D

Oxidation Reduction Potentials, Oxygen Concentration and Oxygen Uptake of Profundal Sediments in a Eutrophic Lake,
W73-13599 5C

OXIDATION LAGOONS
Survival of Salmonella Typhimurium in Animal Manure Disposal in a Model Oxidation Ditch,
W73-13253 5C

OXYGEN SAG
Extensive Oxygen Depletion in Mobile Bay, Alabama,
W73-13065 5C

OXYGENATION
Secondary Sewage Treatment in Pipeline Contactors,
W73-13077 5D

OYSTERS
Marine Sciences.
W73-13343 5B

Occurrence of SE75 and SN113 in Oysters,
W73-13424 5A

Oyster Herpes-Type Virus,
W73-13437 5C

OZONE
Treatment of Complex Cyanide for Reuse or Disposal,
W73-13468 5D

PAKISTAN (SIND RIVER)
Study of Parasites in Fishes of the Sind River: I. Trematodes of Hilsa ilisha (Ham.),
W73-13634 5C

PALEOHYDROLOGY
Subsidence of the Venice Area During the Past 40,000 Yr,
W73-13526 2F

PANAMA
Pathogenicity of Rhizoctonia Solani to Aquatic Plants,
W73-13503 5C

PAPER CHROMATOGRAPHY
Chromatography of 48 Metal Ions on Stannic Arsenate and Plain Papers in Butanol-Nitric Acid Media,
W73-13281 5A

PARAMETRIC HYDROLOGY
Bayesian Hydrologic Model Building,
W73-13144 2A

PARAQUAT
Effect of Water Regime on the Sucrose-Enzyme Relationships of Sugarcane Dessicated With Paraquat,
W73-13114 3F

PARASITE FAUNA
Parasite Fauna and Seasonal Contamination of Coregonus Lavaretis in Lake Sevan,
W73-13400 2H

PARASITES
Helminth Parasites of Four Species of Sunfishes (Centrarchidae) From Lake Wilgreen in Kentucky,
W73-13268 2

Experimental Study of the Effect of Temperature on Some Pike Parasites, (In Russian),
W73-13399 5C

Aspina Trium Gallieni N. Sp. (Monogena Polyopisthocotylea) Parasite of Strongylura Acus Lacepede 1803, (In French),
W73-13590 2

PARTICLE SIZE
Variations in Grain Size of Bottom Sediment in Lowland and Mountain Streams (Izmenchivost' krupnosti donnykh otlozheniy ravninnykh i gornykh rek),
W73-13051 2

Size Classes of Organic Carbon in Seawater,
W73-13062 5

An Elutriator Method for Particle-Size Analysis with Quantitative Silt Fractionation,
W73-13533 2

PATENTS
Solid Waste Disposal and Water Purificatio Method and Apparatus,
W73-13320 5

Screening and Aerating Concentrator,
W73-13321 5

Apparatus for Distillation of Fluids,
W73-13322 3

Process and System for Extracting Salts, Co centrated Brine, and/or Pure Water Fro Saline Water,
W73-13323 3

Aerators,
W73-13324 5

Perforated Tube Module for Liquid Treatmen
W73-13325 5

Water Purifying Apparatus,
W73-13326 5

Liquid Filtering Apparatus,
W73-13327 5

Apparatus for the Purification of Waste Wate
W73-13328 5

Method for Efficiently Separating Slurry-St Liquid into Solid Part and Liquid Part and Apparatus Therefor,
W73-13330

Flexible Oil Boom for High Sea,
W73-13331

Process for Treating Septic Biological Was in Arctic Climates,
W73-13332

Device for Fencing and Absorbing Contamin ing Oil Spills on Water,
W73-13333

Process for the Reduction of the Biochemi Oxygen Demand of Sewage, and for Recovery of the Inherent Protein,
W73-13334

Method for Treating Acid Water Contain Metallic Values,
W73-13335

Multi-Stage Flash Distillation Process,
W73-13336 3A

Apparatus for Eliminating Oil Slicks from Large Bodies of Water,
W73-13337 5G

TH OF POLLUTANTS
Interaction Between Marine Organisms and Oil Pollution,
W73-13023 5C

Finite Element Solution to Unconfined Groundwater Flow With Infiltration,
W73-13031 5B

Phosphate Movement From an Agricultural Watershed During Two Rainfall Periods,
W73-13115 5B

Epoxidation and Fate of (C-14)Aldrin in Insecticide-Resistant and Susceptible Populations of Mosquitofish (Gambusia affinis),
W73-13190 5B

sotophic Tracer Techniques for Identification f Sources of Nitrate Pollution,
W73-13201 5B

Salt Pickup from Agricultural Lands in the Grand Valley of Colorado,
W73-13202 5B

Literature Pertaining to Water Quality and Quantity in Unsaturated Porous Media,
W73-13302 5B

The Role of Paper Mill Additives as Potential Stream Pollutants,
W73-13338 5B

Eighteenth Annual Conference on Bioassay, Environmental and Analytical Chemistry, Oct. 0-11, 1972, Program and Abstracts.
W73-13415 5A

W73-13416 5B

oil Contamination. 2. Penetration of Radioactive Ions Present in Solutions Dumped on the urface (Contamination Des Sols. Comportement Des Ions Radioactifs Dans Les Sols Non tures),
W73-13417 5B

Simple Model of Strontium and Manganese ynamics in a Tropical Rain Forest,
W73-13419 5B

istribution of CS137 in Soils and Vegetation n the Island of Puerto Rico,
W73-13423 5B

ffect of the Rate of Application and the olume of Applied Water on the Rate of Mobility of Certain Insecticides in Clay Soil,
W73-13579 5B

THOGENIC BACTERIA
thogenicity of Fungi and Bacteria from India Hydrilla and Waterhyacinth,
W73-13502 5C

THOGENIC FUNGI
thogenicity of Fungi and Bacteria from India Hydrilla and Waterhyacinth,
W73-13502 5C

thogenicity of Rhizoctonia Solani to Aquatic ants,
W73-13503 5C

PATHOLOGY
Acute Effects of Administration of Methyl Mercuric Chloride on Tissues and Enzyme Activity in Channel Catfish (Ictalurus punctatus),
W73-13029 5C

PEAT
The Effect of Ground Water Level on Water Movement in Peat: A Study Using Tritiated Water,
W73-13093 4A

PELAGIC ANIMALS
Taxonomic Guides to Arctic Zooplankton (V): Pelagic Polychaetes of the Central Arctic Basin,
W73-13233 5A

PELODERA
A Simple Technique for Isolation of Pelodera Chitwoodi, a Bacteriophagous Nematode, from Soil,
W73-13501 5A

PENNSYLVANIA
Losses of Atrazine in Runoff Water and Soil Sediment,
W73-13102 5B

Functional and Psychological Integration in a Rural Community,
W73-13305 6B

Hydrochemical Environments of Carbonate Terrains.
W73-13361 2K

Energy Flow in a Woodland Stream Ecosystem: II. The Taxonomic Composition and Phenology of the Chironomidae as Determined by the Collection of Pupal Exuviae,
W73-13509 5C

PENNSYLVANNIA
Final Environmental Statement Related to the Construction of Susquehanna Steam Electric Station Units 1 and 2.
W73-13412 5C

PERFORMANCE
Process Design Manual for Upgrading Existing Wastewater Treatment Plants.
W73-13132 5D

PERIPHYTON
The Effects of Enrichment on Lake Superior Periphyton,
W73-13011 5C

Establishment of Invertebrate Communities on Log Substrates in the Kaskaskia River, Illinois,
W73-13508 5C

PERISCOPES
A Periscope for the Study of Borehole Walls, and its Use in Ground-Water Studies in Niagara County, New York,
W73-13555 4B

PERMEABILITY
Temperature-Dependence of Permeability to Water and to Sodium of the Gill Epithelium of the Eel Anguilla Anguilla,
W73-13475 5C

PERMEABLE ZONES
A Periscope for the Study of Borehole Walls, and its Use in Ground-Water Studies in Niagara County, New York,
W73-13555 4B

PERSISTENCE
Persistence of Virus and Bacteria in Seawater,
W73-13272 5C

PESTICIDE KINETICS
Uptake and Accumulation of DDT and PCB by Ephemera Danica (Ephemeroptera) in Continuous-Flow Systems,
W73-13265 5C

PESTICIDE RESIDUES
Fritted Disc Funnels and Tapered Stainless Steel Tubes and Stoppers for Use in Pesticide Residue Analysis,
W73-13246 5A

Effects of Fixation on the Extraction of Dieldrin and p,p'-DDT from Muscle Tissue,
W73-13247 5A

Residues of DDT in Cod from Norwegian Fjords,
W73-13249 5A

Residue Determination of Ethylenethiourea (2-Imidazolidinethione) From Tomato Foliage, Soil, and Water,
W73-13259 5A

Distortion of Mirex Residues in Insects Owing to Use of Isopropyl Alcohol as a Collection Solvent,
W73-13274 5A

An Isolation and Cleanup Procedure for Low Levels of Organochlorine Pesticide Residues in Fats and Oils,
W73-13284 5A

Comparative Extraction of Chlorinated Hydrocarbon Insecticides from Soils 20 Years after Treatment,
W73-13285 5B

PESTICIDE TOXICITY
Avoidance of Pesticides by Grass Shrimp (Palaemonetes pugio),
W73-13173 5C

PESTICIDES
Pesticides, Pollution, and Food Supply,
W73-13104 5G

PETROLEUM INDUSTRY
Water Requirements of the Petroleum Refining Industry,
W73-13561 3E

Preliminary Report on the Disposal of Oil-Field Brines in the Ritz-Canton Oil Field, McPherson County, Kansas,
W73-13564 5G

PHALARIS
Root Distribution and Soil Moisture Studies in Some Perennial Ryegrass and Phalaris Pastures on Southern Tablelands, South-eastern Australia,
W73-13110 2I

PHENOLOGY
Energy Flow in a Woodland Stream Ecosystem: II. The Taxonomic Composition and Phenology of the Chironomidae as Determined by the Collection of Pupal Exuviae,
W73-13509 5C

PHENOLS
Chromatographic Separation of Phenols Using an Acrylic Resin,
W73-13166 5A

PHENOLS

A New Chromogenic Reagent for the Detection of Phenolic Compounds on Thin-Layer Plates,
W73-13169 5A

Parathion Exposure Studies. A Gas Chromatographic Method for the Determination of Low Levels of p-Nitrophenol in Human and Animal Urine,
W73-13174 5A

The New Method for the Determination of Cobalt in Sea Water by Solvent Extraction with 2-Nitroso-5-Diethylaminophenol,
W73-13183 5A

Influence of Phenol and Temperature on the Respiration of a Freshwater Snail Helisoma Trivolvis,
W73-13454 5C

A Little Phenol Stirs up a Lot of Public Relations,
W73-13550 5F

PHEO-PIGMENTS

The Seasonal Cycle of Pheopigments in Lake Ontario with Particular Emphasis on the Role of Zooplankton Grazing,
W73-13572 5C

PHOSPHATES

The Effects of Enrichment on Lake Superior Periphyton,
W73-13011 5C

Determination of Low Phosphate Concentrations in Seawater by an Isobutyl Acetate Extraction Procedure,
W73-13057 5A

Compeittion Between Grass and Clover for Phosphate: II. Effect of Root Activity, Efficiency of Response to Phosphate, and Soil Moisture,
W73-13097 3F

Phosphate Movement From an Agricultural Watershed During Two Rainfall Periods,
W73-13115 5B

Atomic Absorption Inhibition Titration of Orthophosphate and Polyphosphates,
W73-13198 5A

Selected Irrigation Return Flow Quality Abstracts 1970-1971, Second Annual Issue,
W73-13472 5G

Effects of Phosphorus Application Rate, Soil Properties, and Leaching Mode on P-32 Movement in Soil Columns,
W73-13553 5B

PHOSPHORUS

Automated Water Monitoring Instrument for Phosphorus Contents,
W73-13470 5A

PHOSPHORUS FIXATION

Effects of Phosphorus Application Rate, Soil Properties, and Leaching Mode on P-32 Movement in Soil Columns,
W73-13553 5B

PHOSPHORUS REMOVAL

Process Design Manual for Phosphorus Removal,
W73-13129 5D

PHOSPHOTHIOATE PESTICIDES

Some Procedures for Isolating Toxic Metabolites of Phosphorothionate Pesticides from Animal Tissues and Fluids,
W73-13196 5A

PHOTOFINISHING WASTES

Treatment of Complex Cyanide for Reuse or Disposal,
W73-13468 5D

PHOTOGRAPHY

Description and Use of an Underwater Television System on the Atlantic Continental Shelf,
W73-13559 7B

PHOTOPERIOD

Gonad Maturation of Brook Trout (Salvelinus fontinalis) in a High Mountain Lake under a Modified Photoperiod,
W73-13128 2H

PHOTOSYNTHESIS

Inheritance and Physiological Effects of Stomatal Frequency in Barley,
W73-13125 3F

Effect of Awns and Drought on the Supply of Photosynthate and Its Distribution Within Wheat Ears,
W73-13595 3F

A Digital Registration System for Net Photosynthesis and Transpiration Measurements in the Field and an Associated Analysis of Errors,
W73-13597 2D

Water and Photosynthesis Relations of Desert Plants in the Mauritanian Sahara: III. Small Shrubs: Hemicryptophytes and Grasses (In German),
W73-13633 2I

PHREATOPHYTES

Productivity of Tall Wheatgrass and Great Basin Wildrye Under Irrigation on a Greasewood-Rabbitbrush Range Site,
W73-13314 3B

PHYTOPLANKTON

Phytoplankton Population Dynamics and Distribution in Two Adjoining Lakes in Srinagar: I. Macroflora in Relation to Phytoplankton,
W73-13096 2H

A Comparison of the Zooplankton Communities in Seven Mountain Lakes Near Lillehammer, Norway (1896 and 1971),
W73-13117 5C

Inorganic Nitrogen Removal From Wastewater: Effect on Phytoplankton Growth in Coastal Marine Waters,
W73-13179 5C

Nitrogen Metabolism in the Sea.
W73-13292 5B

Iron-55 in the Human Populations of the World.
W73-13347 5B

The Interaction of Light Intensity and DDT Concentration Upon the Marine Diatom, Nitzschia delicatissima Cleve,
W73-13500 5C

Establishment of Invertebrate Communities on Log Substrates in the Kaskaskia River, Illinois,
W73-13508 5C

Phytoplankton in Lakes of the Sulak Riv Basin in Dagestan, (In Russian),
W73-13606

Measurements of Microalgal Primary Prod tion (Phytoplankton and Microbenthos) in Smalandshavet (Denmark),
W73-13612

PHYTOSOCIOLOGICAL STUDIES

Phytosociological Study of the Mangroves the Tulear Region (Madagascar): I. The M grove Trees of Sarodrano and Tulear French),
W73-13632

PIGMENTS

Influence of Sulfite on Growth, Slime, Fluoresecent Pigment Formation by Ps domonas Aeruginosa,
W73-13237

PIKE

Experimental Study of the Effect of Temp ture on Some Pike Parasites, (In Russian),
W73-13399

PIPES

A Minimum Cost Water Distribution Netwo
W73-13071

Design of Optimal Water Distribution works Using Dynamic Programming,
W73-13072

PLANKTON

Chlorinated Hydrocarbons in Plankton the Gulf of Mexico and Northern Caribbea
W73-13273

PLANNING

Regional Water Resource Planning for U Needs: Part II (Appendices),
W73-13015

A Procedure for Assessing Water Reso for Urban Planning,
W73-13035

The Coastal Zone as an Integral Eleme Water-Resource Systems,
W73-13036

International Symposium on Uncertainti Hydrologic and Water Resource Systems, II.
W73-13134

Natural Regime Hydrological Ne Planning, A Methodological Discussion,
W73-13136

Subjective Planning: A Model for Resource Development,
W73-13150

Problems of Water Resource Developm the Gulf Coast Estuarine Zone,
W73-13152

Some Possible Changes in Future Social and Priorities: Strategic Implications for Resources Planning,
W73-13153

Decision Making in Water Resource Allo
W73-13301

Proceedings of Conference on Toward a Resources Research Plan for Minnesota.
W73-13303

Upper Mississippi River Comprehensive Basin Study, Appendix L--Fish and Wildlife Resources.
W73-13492 6B

Upper Mississippi River Comprehensive Basin Study, Appendix M--Power.
W73-13493 6B

Upper Mississippi River Comprehensive Basin Study, Appendix N--Agriculture.
W73-13494 6B

Upper Mississippi River Comprehensive Basin Study, Appendix Q--Framework for Development.
W73-13497 6B

Groundwater: From Windmills to Comprehensive Public Management,
W73-13505 6E

PLANNING PROCEDURES
Methodology for Assessment of Urban Water Planning Objectives,
W73-13017 3D

PLANT GROWTH
Plant Induced Soil Salinity Patterns in Two Saltbush (Atriplex SPP.) Communities,
W73-13316 3C

Responses of Semidesert Grasses to Seasonal Rest,
W73-13318 4A

PLANT TISSUES
Hydrocarbons in the Pelagic Sargassum Community,
W73-13172 5B

The Determination of All Detectable Elements in the Aquatic Plants of Linsley Pond and Cedar Lake (North Bradford, Connecticut) By X-Ray Emission and Optical Emission Spectroscopy,
W73-13261 5A

Gas Chromatographic Determination of Residues of Methylcarbamate Insecticides in Crops as Their 2,4-Dinitrophenyl Ether Derivatives,
W73-13282 5A

Complex Characteristics of the Water-Holding Capacity of Plant Tissues, (In Russian),
W73-13576 3F

PLANTING MANAGEMENT
Methods for Seeding Three Perennial Wheatgrasses on Cheatgrass Ranges in Southern Idaho,
W73-13319 4A

PLASTIC FOAM PLUGS
Feasibility of Plastic Foam Plugs for Sealing Leaking Chemical Containers,
W73-13019 5G

PLASTID PIGMENTS
State of Plastid Pigments in Leaves of Essential-Oil-Bearing Plants Under Different Water Supplies, (In Russian),
W73-13575 2I

PODZOLIC ENVIRONMENT
Contribution to the Study of the Condensation of Organic Compounds During Humus Formation in a Podzolic Environment (In French),
W73-13627 2I

POISONS
The Polarographic Determination of Trace Amounts of Cyanide,
W73-13067 5A

POLAND (SILESIA)
Comparison of Pollution Degree of Fluvial Waters Evaluated by Means of the BOD5 Test and a Saprobiological Method,
W73-13622 5B

POLAND (SZCZECIN)
Results of Drinking Water Testing in the Szczecin Province Area Undertaken as Prophylactic Measure Against Alimentary Poisoning of Infants, (In Polish),
W73-13581 5A

POLAROGRAPHIC ANALYSIS
The Polarographic Determination of Trace Amounts of Cyanide,
W73-13067 5A

POLLUTANT IDENTIFICATION
Detecting and Measuring Oil on Water,
W73-13094 5A

A Method for the Detection of Traces of Nitrosamines Using Combined Gas Chromatography and Mass Spectrometry,
W73-13165 5A

Separation of NTA and EDTA Chelates by Thin-Layer Chromatography,
W73-13168 5A

A New Chromogenic Reagent for the Detection of Phenolic Compounds on Thin-Layer Plates,
W73-13169 5A

Trends in Methodology for Evaluation of Effects of Pollutants on Marine Organisms and Ecosystems,
W73-13171 5C

Electron Capture Gas Chromatographic Analysis of DDA: Utilization of 2-Chloroethanol Derivative,
W73-13176 5A

A Sensitive mechanized Determination of ATP Plus ADP,
W73-13177 5A

Polychlorobiphenyls in North Atlantic Ocean Water,
W73-13178 5A

Extraction and Gas Chromatographic Determination of Methyl, -Ethyl-, and Methoxyethylmercury (II) Halides,
W73-13182 5A

The New Method for the Determination of Cobalt in Sea Water by Solvent Extraction with 2-Nitroso-5-Diethylaminophenol,
W73-13183 5A

Potentiometric Studies on Thioacetamide by Means of a Sulphide Ion-Selective Membrane Electrode,
W73-13197 5A

Gas Chromatography of Tl, Se, Te, Hg, As, Sb, Bi, Sn as Phenyl Compounds, (Gas-Chromatographie von Tl, Se, Te, Hg, As, Sb, Bi, Sn als Phenylverbindungen),
W73-13235 5A

Mass Spectrometric Determination of Diethyldithiocarbamates,
W73-13241 5A

Micromethod System for Identification of Anaerobic Bacteria,
W73-13242 5A

Effect of Dyes on Bacterial Growth,
W73-13243 5B

Metabolism of Nitrilotriacetate by Cells of Pseudomonas Species,
W73-13244 5B

Survival of Salmonella Typhimurium in Animal Manure Disposal in a Model Oxidation Ditch,
W73-13253 5C

Hydrocarbons from Sea Water,
W73-13257 5A

Residue Determination of Ethylenethiourea (2-Imidazolidinethione) From Tomato Foliage, Soil, and Water,
W73-13259 5A

Distribution and Background Levels of Mercury in Sediment Cores From Selected Wisconsin Lakes,
W73-13264 5B

Distortion of Mirex Residues in Insects Owing to Use of Isopropyl Alcohol as a Collection Solvent,
W73-13274 5A

Atomic Absorption Spectrometry of Traces of Tri- and Hexavalent Chromium,
W73-13275 5A

Micro and Semimicro Determination of Thiols with Ion-Selective Electrodes,
W73-13289 5A

Activation Analysis of Trace Elements in Biological Materials, (Analyse Par Activation De Mecroquantites D'Elements Dans Les Materiaux Biologique),
W73-13420 5A

Occurrence of SE75 and SN113 in Oysters,
W73-13424 5A

Automated Water Monitoring Instrument for Phosphorus Contents,
W73-13470 5A

The Significance of Hydrocarbon Assimilation in Yeast Identification,
W73-13512 5A

Water: Examination, Assessment, Conditioning, Chemistry, Bacteriology, Biology,
W73-13573 5A

Colorimetric Assay for Carboxymethyloxysuccinate, A New Detergent Builder,
W73-13637 5A

An Improved Method for the Analysis of Linear Alkylate Sulfonate,
W73-13643 5A

POLLUTION ABATEMENT
A Prototype High Seas Oil Recovery System: Phase I--System Development, Vol. III,
W73-13040 5G

Pollution Abatement Programs in the Delaware River Estuary,
W73-13164 5G

Flexible Oil Boom for High Sea,
W73-13331 5G

POLLUTION ABATEMENT

Device for Fencing and Absorbing Contaminating Oil Spills on Water,
W73-13333 5G

Apparatus for Eliminating Oil Slicks from Large Bodies of Water,
W73-13337 5G

Ground-Water Contamination and Legal Controls in Michigan,
W73-13562 5B

POLLUTION IDENTIFICATION

Polarization: A Key to an Airborne Optical System for the Detection of Oil on Water,
W73-13167 5A

POLOMET' RIVER

Experiment in Determining Total Sediment Discharge (Suspended Load and Bed Load) (Opyt vychisleniya polnogo raskhoda nanosov (vzveshennykh i vlekomykh)),
W73-13049 2J

POLONIUM RADIOISOTOPES

A Simultaneous Determination of Lead-210 and Polonium-210 in Sea Water,
W73-13184 5A

POLYAMINE RESINS

Analytical Applications of Polyamine-Polyurea Chelating Resins,
W73-13571 5A

POLYCHAETES

Taxonomic Guides to Arctic Zooplankton (V): Pelagic Polychaetes of the Central Arctic Basin,
W73-13233 5A

POLYCHLORINATED BIPHENYLS

Uptake and Accumulation of DDT and PCB by Ephemera Danica (Ephemeroptera) in Continuous-Flow Systems,
W73-13265 5C

Chlorinated Hydrocarbons in Plankton from the Gulf of Mexico and Northern Caribbean,
W73-13273 5B

An Isolation and Cleanup Procedure for Low Levels of Organochlorine Pesticide Residues in Fats and Oils,
W73-13284 5A

POLYCHLORINATED CIPHENYLIS

Polychlorobiphenyls in North Atlantic Ocean Water,
W73-13178 5A

POLYELECTROLYTES

Effects of a Polyelectrolyte as a Filter Aid,
W73-13089 5F

Evaluation and Development of Physical-Chemical Techniques for the Separation of Emulsified Oil from Water,
W73-13642 5D

POLYPHOSPHATES

Atomic Absorption Inhibition Titration of Orthophosphate and Polyphosphates,
W73-13198 5A

POLYUREA RESINS

Analytical Applications of Polyamine-Polyurea Chelating Resins,
W73-13571 5A

PORE WATER

Postdepositional Osmotic Adjustments in Sediments from Soap Lake, Washington,
W73-13064 2J

A Sediment Squeezer for Removal of Pore Waters Without Air Contact,
W73-13531 2J

PORE WATER SQUEEZER

A Sediment Squeezer for Removal of Pore Waters Without Air Contact,
W73-13531 2J

PORES

The Significance of the Solution of Feldspar in Porosity Development,
W73-13537 2J

POROSITY

The Significance of the Solution of Feldspar in Porosity Development,
W73-13537 2J

POROUS MEDIA

Literature Pertaining to Water Quality and Quantity in Unsaturated Porous Media,
W73-13302 5B

Viscous Finger Wavelength Degeneration in Hele-Shaw Models,
W73-13375 2F

POTABLE WATER

Analysis of Organic Constituents Present in Drinking Water,
W73-13240 5A

The Present Status of Research on the Disinfection of Drinking Water in the USSR,
W73-13390 5F

Water: Examination, Assessment, Conditioning, Chemistry, Bacteriology, Biology,
W73-13573 5A

Results of Drinking Water Testing in the Szczecin Province Area Undertaken as Prophylactic Measure Against Alimentary Poisoning of Infants, (In Polish),
W73-13581 5A

On Bacterial Aftergrowth in Drinking and Industrial Water: I. The Influence of Ion-Exchange Plants (In German),
W73-13629 5F

Materials for Hygienic Assessment of Salt Composition in Drinking Water: VI. Effect of Consumption of Magnesium Salts with Drinking Water on Ossification Processes in Growing Animals,
W73-13630 5C

POTASSIUM ELECTRODES

A Potassium-Selective Silicone-Rubber Membrane Electrode Based on a Neutral Carrier,
W73-13185 5A

POTATOES

Potential Evaporation from Pasture and Potatoes at Aspendale,
W73-13296 2D

POTENTIAL WATER SUPPLY

Preliminary Study of Potential Sites for Water-Supply Reservoirs in West and Southeast Alabama,
W73-13041 6D

A Survey of the Water Resources of St. Thomas, Virgin Islands,
W73-13516 2A

POTENTIOMETRIC TITRATION

Micro and Semimicro Determination of Thiols with Ion-Selective Electrodes,
W73-13289 5A

POTENTIOMETRY

Enzyme Electrodes,
W73-13266 5A

POTENTIONMETRIC TITRATION

Potentiometric Studies on Thioacetamide by Means of a Sulphide Ion-Selective Membrane Electrode,
W73-13197 5A

POULTRY

Cost of Waste Water Pollution Abatement in Poultry Processing and Rendering Plants in Georgia,
W73-13003 5D

POULTRY PROCESSING WASTES

Cost of Waste Water Pollution Abatement in Poultry Processing and Rendering Plants in Georgia,
W73-13003 5D

POWER DEMAND

Geothermal Energy--Resources, Production Stimulation.
W73-13214 6I

Introduction: The Energy Outlook,
W73-13215 6I

Worldwide Status of Geothermal Resource Development,
W73-13216 6I

Assessment of U.S. Geothermal Resources,
W73-13217 6

Characteristics of Geothermal Resources,
W73-13218 3

Explorations for Geothermal Resources,
W73-13219 3

Steam Production at the Geysers Geotherm Field,
W73-13220 3

Design and Operation of the Geysers Pow Plant,
W73-13221 8

Geothermal Resources Research,
W73-13232 6

POWERPLANTS

Upper Mississippi River Comprehensive Ba Study, Appendix M--Power.
W73-13493

PRAIRIE POTHOLES

Groundwater Hydrology of Prairie Potholes North Dakota,
W73-13383

PRE-IMPOUNDMENT

A Mathematical Model for Preliminary Eval tions of Candidate Reservoir Systems,
W73-13529

PRECIPITATION (ATMOSPHERIC)

Evaluation of Techniques for Determin Average Precipitation in Semiarid Valleys Idaho,
W73-13028

Sulphate Deposition by Precipitation Into Lake Ontario,
W73-13270 5B

RECIPITATION GAGES
Evaluation of Techniques for Determining Average Precipitation in Semiarid Valleys of Idaho,
W73-13028 2B

RECISION
Errors of Measurement, Precision, Accuracy and the Statistical Comparison of Measuring Instruments,
W73-13194 7A

REDATION
Effect of Thermal Shock on Vulnerability to Predation in Juvenile Salmonids. II. A Dose Response by Rainbow Trout to Three Shock Temperatures,
W73-13291 5C

RESSURE
On Properties of Seawater Defined by Temperature, Salinity and Pressure,
W73-13477 2K

RESSURIZED WATER REACTORS
Final Environmental Statement Related to Operation of Surry Power Station Unit 1.
W73-13408 5C

Final Environmental Statement Related to the St. Lucie Plant Unit No. 1.
W73-13410 5C

Final Environmental Statement Related to the Continuation of Construction of Unit 2 and the Operation of Units 1 and 2 Millstone Nuclear Power Station.
W73-13411 5C

RICING
Reservoir Management: Optimal Pricing and Rationing Policies under Uncertainty,
W73-13141 4A

RIMARY PRODUCTION
Measurements of Microalgal Primary Production (Phytoplankton and Microbenthos) in the Smalandshavet (Denmark),
W73-13612 5C

Chlorophyll Content and Primary Production of Sessile Algal Community in Mountain Stream Chigonozawa Running Close to Kiso Biological Station of the Kyoto University,
W73-13614 5C

RIMARY PRODUCTIVITY
The Interaction of Light Intensity and DDT Concentration Upon the Marine Diatom, Nitzschia delicatissima Cleve,
W73-13500 5C

RINCE EDWARD ISLAND
Barrier Islands, Sand Spits and Dunes in the Southern Gulf of St. Lawrence,
W73-13206 2J

RIOR APPROPRIATION
Rights to Nebraska Streamflows: An Historical Overview with Recommendations,
W73-13506 6E

RIORITIES
Some Possible Changes in Future Social Values and Priorities: Strategic Implications for Water Resources Planning,
W73-13153 6B

PROBABILITY
The Margin of Safety for Compensating Losses Due to Uncertainties in Hydrological Statistics,
W73-13157 6B

Concerning the Calculation of Level Veriation of Cutoff Water Balance,
W73-13163 4A

PROCESS CONTROL
Electrophoretic Evaluation and Process Control,
W73-13547 5F

PRODUCTIVITY
Productivity and Distribution of Trichoptera Larvae in a Colorado Mountain Stream,
W73-13124 2I

Dry Farming: Uncertainty in Land and Water Productivity,
W73-13160 3F

Productivity of Tall Wheatgrass and Great Basin Wildrye Under Irrigation on a Greasewood-Rabbitbrush Range Site,
W73-13314 3B

PROJECT PLANNING
Strategic Uncertainty and the National Environmental Policy Act,
W73-13148 6B

Upper Mississippi River Comprehensive Basin Study: Volume I, Main Report.
W73-13480 6B

PROJECT PLOWSHARE
Recovery of Geothermal Energy from Hot, Dry Rock with Nuclear Explosives,
W73-13226 8H

PROJECTIONS
Upper Mississippi River Comprehensive Basin Study: Volume I, Main Report.
W73-13480 6B

Upper Mississippi River Comprehensive Basin Study, Appendix A--History of Investigation.
W73-13481 6B

Upper Mississippi River Comprehensive Basin Study, Appendix L--Fish and Wildlife Resources.
W73-13492 6B

Upper Mississippi River Comprehensive Basin Study, Appendix P--Economic Base Study and Projections.
W73-13496 6B

PROJECTS
Computer Programs in Hydrology,
W73-13076 7C

The Margin of Safety for Compensating Losses Due to Uncertainties in Hydrological Statistics,
W73-13157 6B

Hydrologic and Hydraulic Design under Uncertainties,
W73-13159 8B

Annual Report. 1971-1972. New Jersey Water Resources Research Institute.
W73-13545 9D

PROTECTION
Environmental Protection Through Public and Private Development Controls,
W73-13025 5G

PROVENANCE
Heavy Minerals of Horn Island, Northern Gulf of Mexico,
W73-13541 2J

PROVIDENCIA ALCALIFACIENS
Fatty Acid Compositions of Paracolons: Arizona, Citrobacter, and Providencia,
W73-13252 5C

PROVIDENCIA STUARTII
Fatty Acid Compositions of Paracolons: Arizona, Citrobacter, and Providencia,
W73-13252 5C

PSEUDOMONAS
Studies on the Interactions of Bacteria and Nematodes,
W73-13001 5C

Methanol Metabolism in Pseudomonad C,
W73-13256 5C

PSEUDOMONAS AERUGINOSA
Slime Production by Pseudomonas Aeruginosa. II. A New Synthetic Medium and Cultural Conditions Suitable for Slime Production by Pseudomonas Aerginosa,
W73-13088 5C

Influence of Sulfite on Growth, Slime, and Fluoresecent Pigment Formation by Pseudomonas Aeruginosa,
W73-13237 5C

PSUDOMONAS
Metabolism of Nitrilotriacetate by Cells of Pseudomonas Species,
W73-13244 5B

PSYCHOLOGICAL ASPECTS
Functional and Psychological Integration in a Rural Community,
W73-13305 6B

PSYCHROMETERS
Diurnal Fluctuations in Soil Water Potential,
W73-13438 2G

PUBLIC HEALTH
A Little Phenol Stirs up a Lot of Public Relations,
W73-13550 5F

PUERTO RICO
A Simple Model of Strontium and Manganese Dynamics in a Tropical Rain Forest,
W73-13419 5B

Distribution of CS137 in Soils and Vegetation on the Island of Puerto Rico,
W73-13423 5B

PULP AND PAPER INDUSTRY
The Role of Paper Mill Additives as Potential Stream Pollutants,
W73-13338 5B

PULP MILL SLUDGE
Feasibility of Using Pulp Mill Sludge as an Additive to Corrugating Medium,
W73-13081 5E

PULP WASTES
Study of Gamma Induced Low Temperature Oxidation of Textile Effluehnts,
W73-13022 5D

Feasibility of Using Pulp Mill Sludge as an Additive to Corrugating Medium,
W73-13081 5E

PULP WASTES

The Role of Paper Mill Additives as Potential Stream Pollutants,
W73-13338 5B

PUMP TESTING
Use of a Neutron Moisture Probe to Determine the Storage Coefficient of an Unconfined Aquifer,
W73-13554 4B

PUMPING
Heat-Transfer Agents for High-Temperature Systems,
W73-13446 8C

PYRROPHYTA
The Influence of Environmental Factors on the Distribution of Freshwater Algae: An Experimental Study. I. Introduction and the Influence of Calcium Concentration,
W73-13546 5C

RADAR
Radar Sounding of the Abramov Glacier (Radiolokatsionnoye zondirovaniye lednika Abramova),
W73-13356 2C

RADIAL FLOW
Theory and Problems of Water Percolation,
W73-13563 8D

RADIATION
Radioactive Waste Management - A Bibliography of Publicly Available Literature Pertaining to the USAEC's Hanford, Washington Production Site.
W73-13414 5B

Wind-Swept Water Surface in Laboratory Cooled by Applying Heat,
W73-13434 2H

RADIOACTIVE FALLOUT
Radioactive Fallout in Rain at Melbourne, 1958 through 1970,
W73-13585 5B

RADIOACTIVE WASTE DISPOSAL
Radioactive Waste Management - A Bibliography of Publicly Available Literature Pertaining to the USAEC's Hanford, Washington Production Site.
W73-13414 5B

RADIOACTIVE WASTES
Radioactive Waste Management - A Bibliography of Publicly Available Literature Pertaining to the USAEC's Hanford, Washington Production Site.
W73-13414 5B

Treatment of Radioactive Steam-Generator Blowdown,
W73-13447 5D

RADIOACTIVITY
Survey of Environmental Radioactivity, January 1-December 31, 1972,
W73-13402 5B

RADIOACTIVITY EFFECTS
Synergistic Bio-Effects of Oil and Irradiation in an Aquatic Organism, Taricha Granulosa,
W73-13248 5C

Accumulation and Retention of 85Sr Marks by Young Largemouth Bass,
W73-13304 5C

Freshwater Ecology.
W73-13341 5B

Marine Sciences.
W73-13343 5B

RADIOACTIVITY TECHNIQUES
Methanol Metabolism in Pseudomonad C,
W73-13256 5C

Nitrogen Metabolism in the Sea.
W73-13292 5B

RADIOCHEMICAL ANALYSIS
A Simultaneous Determination of Lead-210 and Polonium-210 in Sea Water,
W73-13184 5A

Eighteenth Annual Conference on Bioassay, Environmental and Analytical Chemistry, Oct. 10-11, 1972, Program and Abstracts.
W73-13415 5A

RADIOECOLOGY
Annual Scientific Report 1971 (Radioactive and Non-Radioactive Contamination of the Environment and the Metabolism of Some Radioelements; Radiophysical Control; Research on Body Contamination; Waste Disposal Research; N on-Radioactive Environmental Pollution).
W73-13349 5B

A Simple Model of Strontium and Manganese Dynamics in a Tropical Rain Forest,
W73-13419 5B

RADIOISOTOPES
Radionuclide Decline in Columbia River Water.
W73-13345 5B

Fate and Effects of Radionuclides in Alaska.
W73-13348 5B

Survey of Environmental Radioactivity, January 1-December 31, 1972,
W73-13402 5B

Methodology for the Identification of a Biological Indicator in Radioecology: Example of CS137 and a Freshwater Mollusc Anodonta, (Methodologie Pour La Recherche D'un Indicateur Biologique En Radioecologie),
W73-13407 5A

Distribution of CS137 in Soils and Vegetation on the Island of Puerto Rico,
W73-13423 5B

Occurrence of SE75 and SN113 in Oysters,
W73-13424 5A

RAIN
Radioactive Fallout in Rain at Melbourne, 1958 through 1970,
W73-13585 5B

RAIN FORESTS
A Simple Model of Strontium and Manganese Dynamics in a Tropical Rain Forest,
W73-13419 5B

RAINBOW TROUT
Geothermal Mercury Pollution in New Zealand,
W73-13175 5B

Toxicity of Methyl Mercury for Steelhead Trout Sperm,
W73-13250 5C

Effect of Thermal Shock on Vulnerability to Predation in Juvenile Salmonids. II. A Dose Response by Rainbow Trout to Three Shock Temperatures,
W73-13291 5C

Age and Growth of the 'Rainbow trout' (Salmo Gairdneri Irideus Gibbons 1855) Living in the Water Valley Reservoir of the Hnilec Valley, (In Czech),
W73-13609 2I

RAINFALL
Uncertainty in the Return Period of Maximum Events: A Bayesian Approach,
W73-13158 2B

Distribution of CS137 in Soils and Vegetation on the Island of Puerto Rico,
W73-13423 5B

RAINFALL DISPOSITION
Evaluation of Techniques for Determining Average Precipitation in Semiarid Valleys of Idaho,
W73-13028 2B

RAINFALL-RUNOFF RELATIONSHIPS
The Effect of Urbanization on Runoff Quantity,
W73-13032 4C

Hydrologic Response of Massachusetts Watersheds,
W73-13034 2A

A Stochastic Model for the Occurrence of Moisture in Vadose Media,
W73-13074 2G

Application of a Simple Hydrologic Model for Rainfall-Runoff Relations of the Dalton Watershed,
W73-13362 2A

RANGE GRASSES
Methods for Seeding Three Perennial Wheatgrasses on Cheatgrass Ranges in Southern Idaho,
W73-13319 4A

RANGE MANAGEMENT
Responses of Semidesert Grasses to Seasonal Rest,
W73-13318 4A

RARE EARTH ELEMENTS
Gas Chromatography of Tl, Se, Te, Hg, As, Sb, Bi, Sn as Phenyl Compounds, (Gas-Chromatographie von Tl, Se, Te, Hg, As, Sb, Bi, Sn als Phenylverbindungen),
W73-13235 5A

RATIONING (WATER)
Reservoir Management: Optimal Pricing and Rationing Policies under Uncertainty,
W73-13141 4A

RECHARGE
Finite Element Solution to Unconfined Groundwater Flow With Infiltration,
W73-13031 2F

RECIRCULATION
Water Requirements of the Petroleum Refining Industry,
W73-13561 5D

RECREATION
Attitudes of Riparians Towards Their Lake Environments: A Study of Lake Wyola and Damon Pond, Massachusetts,
W73-13007 6B

Upper Mississippi River Comprehensive Basin Study, Appendix K--Recreation.
W73-13491 6B

ECREATION DEMAND
A Comparison of Consumer's Surplus and Monopoly Revenue Estimates of Recreational Value for Two Utah Waterfowl Marshes,
W73-13018 6B

ECREATION FACILITIES
Upper Mississippi River Comprehensive Basin Study, Appendix K--Recreation.
W73-13491 6B

ECYCLING
Feasibility of Using Pulp Mill Sludge as an Additive to Corrugating Medium,
W73-13081 5E

Effect of Calcium Lignosulfonate on Properties of Concrete at Early Ages,
W73-13644 5D

ED BUTTE CANYON (UTAH)
Effect of Plant Moisture Stress on Carbohydrate and Nitrogen Content of Big Sagebrush,
W73-13309 2I

ED CLAY CREEK (DEL)
The Effect of Urbanization on Runoff Quantity,
W73-13032 4C

ED CLOVER (TUROA)
Water Stress in 'Turoa' Red Clover Under 'Aotea' Wheat,
W73-13527 3F

EGIMEN
Characteristics of the Hydrologic Regimen of the Koksu River in 1970 (Osobennosti gidrologicheskogo rezhima r. Koksu v 1970 g.),
W73-13354 2E

EGIONAL ANALYSIS
Institutional Requirements for Optimal Water Quality Management in Arid Urban Areas,
W73-13002 5G

Attitudes, Values, and Perceptions in Water Resource Decision-making Within a Metropolitan Area,
W73-13008 6B

Reliability: A New Parameter in Urban Water Quality Management,
W73-13156 5D

EGIONAL DEVELOPMENT GUIDELINES
Upper Mississippi River Comprehensive Basin Study, Appendix Q--Framework for Development.
W73-13497 6B

EGIONAL ECONOMICS
Evaluation of Discontinuities in Regional Population Projections,
W73-13006 6B

EGRESSION ANALYSIS
Use of Cross Correlation Between Hydrological Time Series to Improve Estimates of Lag One Autoregressive Parameters,
W73-13364 7C

EGULATION
Data Acquisition Systems in Water Quality Management,
W73-13024 5G

Modelling the Regulation of Lake Superior under Uncertainty of Future Water Supplies,
W73-13140 4A

Environmental Legislation: How it Affects Fossil-Fuel-Fired Power-Generating Equipment,
W73-13474 6E

RELATIVE HUMIDITY
Data on the Water Balance of Some Xerothermic Terrestrial Lichens,
W73-13397 2I

RELIABILITY
Reliability: A New Parameter in Urban Water Quality Management,
W73-13156 5D

The Sensitivity of Return Periods to Variations in Retention Levels for Different Definitions of Shortage,
W73-13162 4A

REMOTE MEASUREMENT
Apparatus for Remote Centralized Measurement of Soil Humidity by the Electrometric Method, (In Italian),
W73-13582 2G

REMOTE SENSING
Developments in Applications of Remote Sensing to Hydrologic Modeling,
W73-13146 2E

Polarization: A Key to an Airborne Optical System for the Detection of Oil on Water,
W73-13167 5A

Environmental Application of Remote Sensing Methods to Coastal Zone Land Use and Marine Resource Mnagement,
W73-13210 2L

On Multidisciplinary Research on the Application of Remote Sensing to Water Resources Problems.
W73-13299 5A

REPRODUCTION
Effects of Temperature, Salinity, and Dissolved Oxygen on the Survival of Striped Bass Eggs and Larvae,
W73-13460 5C

RESEARCH
Annual Report. 1971-1972. New Jersey Water Resources Research Institute.
W73-13545 9D

RESEARCH AND DEVELOPMENT
Changing Times for Water Research and Technology Transfer,
W73-13038 6B

On Multidisciplinary Research on the Application of Remote Sensing to Water Resources Problems.
W73-13299 5A

Mariculture Comes of Age,
W73-13452 8I

RESEARCH PRIORITIES
Proceedings of Conference on Toward a Water Resources Research Plan for Minnesota.
W73-13303 6E

RESERVOIR DESIGN
A Mathematical Model for Preliminary Evaluations of Candidate Reservoir Systems,
W73-13529 8D

RESERVOIR OPERATION
Reservoir Management: Optimal Pricing and Rationing Policies under Uncertainty,
W73-13141 4A

RESERVOIR SITES
Preliminary Study of Potential Sites for Water-Supply Reservoirs in West and Southeast Alabama,
W73-13041 6D

RESERVOIR STORAGE
Preliminary Study of Potential Sites for Water-Supply Reservoirs in West and Southeast Alabama,
W73-13041 6D

The Sensitivity of Return Periods to Variations in Retention Levels for Different Definitions of Shortage,
W73-13162 4A

RESERVOIRS
Study of Suspended Sediments in Reservoirs by the Method of Spectral Diffusivity (Izucheniye vzveshennykh nanosov v vodokhranilishchakh metodom spektral'noy yarkosti),
W73-13052 2J

Climatic Uncertainty Effects on Management and Design of Reservoir-Irrigation Systems,
W73-13137 3F

'Extended-Range' Meteorological Forecasts Applied to Multi-Reservoir Management Decisions,
W73-13139 2A

A Mathematical Model for Preliminary Evaluations of Candidate Reservoir Systems,
W73-13529 8D

RESINS
Chromatographic Separation of Phenols Using an Acrylic Resin,
W73-13166 5A

Treatment of Acid Mine Waters,
W73-13549 5F

Analytical Applications of Polyamine-Polyurea Chelating Resins,
W73-13571 5A

RESISTIVITY
Estimating Water Quality from Electrical Logs,
W73-13556 4B

RESOURCE ALLOCATION
Decision Making in Water Resource Allocation,
W73-13301 6B

RESPIRATION
Influence of Phenol and Temperature on the Respiration of a Freshwater Snail Helisoma Trivolvis,
W73-13454 5C

Inverse Compensation for Temperature in Oxygen Consumption of the Hylid Frog Pseudacris Triseriata,
W73-13458 5C

RETENTION LEVELS
The Sensitivity of Return Periods to Variations in Retention Levels for Different Definitions of Shortage,
W73-13162 4A

RETENTION TIME
Identification by Means of Retention Parameters,
W73-13511 5A

RETENTION VOLUME
Identification by Means of Retention Parameters,
W73-13511 5A

RETURN FLOW
Sociological Considerations in Irrigation Water Management: Facing Problems of Water Quality Control,
W73-13307 5G

Irrigation Management for Control of Quality of Irrigation Return Flow,
W73-13469 5G

Selected Irrigation Return Flow Quality Abstracts 1970-1971, Second Annual Issue,
W73-13472 5G

REVERSE CIRCULATION
Dual String Drilling Method Yields Improved Samples,
W73-13565 8C

REVIEWS
Computer Programs in Hydrology,
W73-13076 7C

Trends in Methodology for Evaluation of Effects of Pollutants on Marine Organisms and Ecosystems,
W73-13171 5C

A Literature Survey of Ocean Pollution,
W73-13211 5B

Literature Pertaining to Water Quality and Quantity in Unsaturated Porous Media,
W73-13302 5B

Potential for the Use of Cobalt-60 Irradiation in the Treatment of Waste Waters,
W73-13401 5D

Magnetic Treatment of Water.
W73-13544 5F

REYNOLDS CREEK WATERSHED (IDAHO)
Evaluation of Techniques for Determining Average Precipitation in Semiarid Valleys of Idaho,
W73-13028 2B

RHIZOCTONIA SOLANI
Pathogenicity of Rhizoctonia Solani to Aquatic Plants,
W73-13503 5C

RHONE RIVER
Levels of Mercury in the Sediments of some Swiss Lakes, Including Lake Geneva and the Rhone River,
W73-13617 5B

RICE SEEDLINGS
Rice Seedlings Germinated in Water with Normal and Impeded Environmental Gas Exchange,
W73-13092 3F

RIPARIAN PLANTS
Contributions of Allochthonous Detritus to the Energy Regime of Doe Run, Meade County, Kentucky,
W73-13056 5B

RIPARIAN RIGHTS
Rights to Nebraska Streamflows: An Historical Overview with Recommendations,
W73-13506 6E

RIPPLE MARKS
Near-Shore Ripples: Some Hydraulic Relationships,
W73-13530 8B

The Origin and Significance of Some Downcurrent-Dipping Cross-Stratified Sets,
W73-13538 2J

RISKS
International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol. II.
W73-13134 4A

Climatic Uncertainty Effects on Management and Design of Reservoir-Irrigation Systems,
W73-13137 3F

Modelling the Regulation of Lake Superior under Uncertainty of Future Water Supplies,
W73-13140 4A

Reservoir Management: Optimal Pricing and Rationing Policies under Uncertainty,
W73-13141 4A

Bayesian Hydrologic Model Building,
W73-13144 2A

Strategic Uncertainty and the National Environmental Policy Act,
W73-13148 6B

Problems of Water Resource Development in the Gulf Coast Estuarine Zone,
W73-13152 2L

Some Possible Changes in Future Social Values and Priorities: Strategic Implications for Water Resources Planning,
W73-13153 6B

Treatment of Some of the Uncertainties Encountered in the Conduct of Hydrologic Cost-Effectiveness Evaluations,
W73-13154 6B

A Report on Corps of Engineers Research on the Management of Uncertainty in Water Resources Planning,
W73-13155 6B

Reliability: A New Parameter in Urban Water Quality Management,
W73-13156 5D

The Margin of Safety for Compensating Losses Due to Uncertainties in Hydrological Statistics,
W73-13157 6B

Uncertainty in the Return Period of Maximum Events: A Bayesian Approach,
W73-13158 2B

Hydrologic and Hydraulic Design under Uncertainties,
W73-13159 8B

Dry Farming: Uncertainty in Land and Water Productivity,
W73-13160 3F

Optimal Design Strategy for Small Flood-Control Structures,
W73-13161 8B

RIVER BASINS
Some Characteristics of Modern Glaciers in the Naryn River Basin (Nekotoryye cherty sovremennogo oledeneniya basseyna r. Naryna),
W73-13358 2C

Description of Glacier Recession in the Amu-Dar'ya River Basin from Aerial Photographic Survey Data for 1946-66 (Kharakteristika otstupaniya lednikov basseyna r. Amudar'i po materialam aerofotos'yemki 1946-1966 gg.),
W73-13359 2C

RIVER DEE (WALES)
The Sensitivity of Return Periods to Variations in Retention Levels for Different Definitions of Shortage,
W73-13162 4A

RIVERS
Characteristics of the Hydrologic Regimen of the Koksu River in 1970 (Osobennosti gidrologicheskogo rezhima r. Koksu v 1970 g.),
W73-13354 2E

ROAD SALTING
Effects of Highway De-Icing Salts on Groundwater and Water Supplies in Massachusetts,
W73-13525 5B

ROCK EXCAVATION
Project Tugboat: Explosive Excavation of a Harbor in Coral,
W73-13212 8H

ROMANIA MURESH RIVER
Distribution, Structure and Trophic Relationships of the Fish Population of the Upper Course of the Muresh River, (In Rumanian),
W73-13610 2I

ROOT SYSTEMS
Compeittion Between Grass and Clover for Phosphate: II. Effect of Root Activity, Efficiency of Response to Phosphate, and Soil Moisture,
W73-13097 3F

Root Distribution and Soil Moisture Studies in Some Perennial Ryegrass and Phalaris Pastures on Southern Tablelands, South-eastern Australia,
W73-13110 2I

ROTARY-HYDRAULIC DRILLING
Design of Casings and Screens for Water Production and Injection Wells,
W73-13568 8B

ROTIFERA
Hydrobiological Investigation of Lake Lere and Neighboring Ponds: II. Rotifera,
W73-13636 2H

ROTIFERS
Seasonal Variations in the Rotifer Population of the Natron Containing Waters of Kanem (Chad),
W73-13467 2H

ROUGH-SKINNED NEWT
Synergistic Bio-Effects of Oil and Irradiation in an Aquatic Organism, Taricha Granulosa,
W73-13248 5C

ROUTING
Technique for Implicit Dynamic Routing in Rivers with Tributaries,
W73-13363 2E

ROWLESBURG RESERVOIR (W VA)
A Mathematical Model for Preliminary Evaluations of Candidate Reservoir Systems,
W73-13529 8D

RURAL SOCIOLOGY
Functional and Psychological Integration in a Rural Community,
W73-13305 6B

RYE GRASS
Root Distribution and Soil Moisture Studies in Some Perennial Ryegrass and Phalaris Pastures on Southern Tablelands, South-eastern Australia,
W73-13110 2I

SAGEBRUSH
Effect of Plant Moisture Stress on Carbohydrate and Nitrogen Content of Big Sagebrush,
W73-13309 2I

SALICYLANILIDES
Toxicity of 33NCS (3'-Chloro-3-Nitrosalicylanilide) to Freshwater Fish and Sea Lamprey,
W73-13293 5C

SALINE SOILS
Pedogenic Calcite Accumulation in Arid and Semiarid Regions of the Indo-Gangetic Alluvial Plain of Erst-While Punjab (India)--Their Morphology and Origin,
W73-13311 2G

Plant Induced Soil Salinity Patterns in Two Saltbush (Atriplex SPP.) Communities,
W73-13316 3C

SALINE WATER
A New Method for Determining the Total Carbonate Ion Concentration in Saline Waters,
W73-13063 2K

SALINE WATER-FRESHWATER INTERFACES
Hydraulic Sand-Model Study of the Cyclic Flow of Salt Water in a Coastal Aquifer,
W73-13558 2L

SALINE WATER INTRUSION
Effect of Solute Dispersion on Thermal Convention in a Porous Medium Layer,
W73-13381 2F

Preliminary Report on the Disposal of Oil-Field Brines in the Ritz-Canton Oil Field, McPherson County, Kansas,
W73-13564 5G

SALINITY
Postdepositional Osmotic Adjustments in Sediments from Soap Lake, Washington,
W73-13064 2J

Salinity and Drainage in a Brown Chernozem Irrigated at Different Minimum Moisture Contents,
W73-13109 3C

Salt Pickup from Agricultural Lands in the Grand Valley of Colorado,
W73-13202 5B

Navifacial Temperature and Salinity Along the Track From Samoa to Hawaii, 1957-1965,
W73-13435 2E

Effects of Temperature, Salinity, and Dissolved Oxygen on the Survival of Striped Bass Eggs and Larvae,
W73-13460 5C

Irrigation Management for Control of Quality of Irrigation Return Flow,
W73-13469 5G

On Properties of Seawater Defined by Temperature, Salinity and Pressure,
W73-13477 2K

Effects of Highway De-Icing Salts on Groundwater and Water Supplies in Massachusetts,
W73-13525 5B

SALMON
Effects of DDT Upon Salmon From Schoodic Lake, Maine,
W73-13120 5C

SALMON DIET
Tests of Variations of the Abernathy Salmon Diet, 1970,
W73-13499 8I

SALMONELLA TYPHIMURIUM
Survival of Salmonella Typhimurium in Animal Manure Disposal in a Model Oxidation Ditch,
W73-13253 5C

SALT
Materials for Hygienic Assessment of Salt Composition in Drinking Water: VI. Effect of Consumption of Magnesium Salts with Drinking Water on Ossification Processes in Growing Animals,
W73-13630 5C

SALT FLUX
The Effect of water and Salt Fluxes on the Transroot Potential in Helianthus annuus,
W73-13066 2I

SALT STORAGE
Water Pollution and Associated Effects from Street Salting,
W73-13471 5B

SALT TOLERANCE
Plant Induced Soil Salinity Patterns in Two Saltbush (Atriplex SPP.) Communities,
W73-13316 3C

Salt and Meal-Salt Help Distribute Cattle use on Semidesert Range,
W73-13317 3F

SALT WATER RESERVOIRS
Preliminary Report on the Disposal of Oil-Field Brines in the Ritz-Canton Oil Field, McPherson County, Kansas,
W73-13564 5G

SALTBUSH
Plant Induced Soil Salinity Patterns in Two Saltbush (Atriplex SPP.) Communities,
W73-13316 3C

SAMPLE PREPARATION
Distortion of Mirex Residues in Insects Owing to Use of Isopropyl Alcohol as a Collection Solvent,
W73-13274 5A

Determination of Nitrogen-15 by Chemical Ionization Mass Spectrometry,
W73-13280 5A

Gas Chromatographic Determination of Residues of Methylcarbamate Insecticides in Crops as Their 2,4-Dinitrophenyl Ether Derivatives,
W73-13282 5A

Mercury Residues in Fish, 1969-1970 - National Pesticide Monitoring Program,
W73-13514 5A

SAMPLE PRESERVATION
Effects of Fixation on the Extraction of Dieldrin and p,p'-DDT from Muscle Tissue,
W73-13247 5A

SAMPLED DATA
Loss of Information by Discretizing Hydrologic Series,
W73-13075 7A

SAMPLING
An Analysis of Sampling-Frequency Alternatives for Fitting a Daily Stream-Temperature Model,
W73-13142 4A

A Sediment Squeezer for Removal of Pore Waters Without Air Contact,
W73-13531 2J

A Vibratory Coring System for Continental Margin Sediments,
W73-13532 2J

A Splitter for Unconsolidated Cores Taken in Plastic Liners,
W73-13535 2J

Oceanic Sediments and Their Diagenesis: Some Examples From Deep-Sea Drilling,
W73-13542 2J

A Portable Sampler for Collecting Water Samples from Specific Zones in Uncased or Screened Wells,
W73-13557 4B

Core Orientation,
W73-13567 8C

SAN ANGELO (TEX)
Subjective Planning: A Model for Water Resource Development,
W73-13150 6A

SAN ANTONIO RIVER (TEX)
Methodology for Assessment of Urban Water Planning Objectives,
W73-13017 3D

SAN ANTONIO (TEX)
Reliability: A New Parameter in Urban Water Quality Management,
W73-13156 5D

Ground-Water Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1972.
W73-13515 4B

SAN FRANCISCO BAY REGION
Map Showing Ranges in Probable Maximum Well Yield from Water-Bearing Rocks in the San Francisco Bay Region, California,
W73-13519 7C

Maps Showing Areas in the San Francisco Bay Region where Nitrate, Boron, and Dissolved Solids in Ground Water May Influence Local or Regional Development,
W73-13520 7C

SAND BARS
Barrier Islands, Sand Spits and Dunes in the Southern Gulf of St. Lawrence,
W73-13206 2J

SAND BARS

Heavy Minerals of Horn Island, Northern Gulf of Mexico,
W73-13541 2J

SAND SPITS
Barrier Islands, Sand Spits and Dunes in the Southern Gulf of St. Lawrence,
W73-13206 2J

SANDS
Comparison Between Compressibilities of Sands and Clays,
W73-13534 2G

Heavy Mineral Concentrating Processes and Density/Shape/Size Equilibria in the Marine and Coastal Dune Sands of the Apalachicola, Florida, Region,
W73-13540 2L

SANGUINICOLA-INERMIS
Sanguinicolosis in Carp in the Winter,
W73-13625 5C

SANTA RITA EXPERIMENTAL RANGE (ARIZ)
Salt and Meal-Salt Help Distribute Cattle use on Semidesert Range,
W73-13317 3F

Responses of Semidesert Grasses to Seasonal Rest,
W73-13318 4A

SAPROBIOLOGICAL METHOD
Comparison of Pollution Degree of Fluvial Waters Evaluated by Means of the BOD5 Test and a Saprobiological Method,
W73-13622 5B

SARGASSUM NATANS
Hydrocarbons in the Pelagic Sargassum Community,
W73-13172 5B

SATURATED SOILS
Pedogenic Calcite Accumulation in Arid and Semiarid Regions of the Indo-Gangetic Alluvial Plain of Erst-While Punjab (India)--Their Morphology and Origin,
W73-13311 2G

SAVANNAH RIVER PLANT
Potential for the Use of Cobalt-60 Irradiation in the Treatment of Waste Waters,
W73-13401 5D

SCALING
Corrosion and Scaling in Nuclear-Stimulated Geothermal Power Plants,
W73-13231 8H

Magnetic Treatment of Water.
W73-13544 5F

SCIRPETUM-SILVATICI
Contribution to the Knowledge of Scirpetum Silvatici in Czechoslovakia (Western Part),
W73-13616 2I

SEA LAMPREY
Toxicity of 33NCS (3'-Chloro-3-Nitrosalicylanilide) to Freshwater Fish and Sea Lamprey,
W73-13293 5C

SEA WATER
Determination of Low Phosphate Concentrations in Seawater by an Isobutyl Acetate Extraction Procedure,
W73-13057 5A

A Reactive Silicate Budget for the Arctic Ocean,
W73-13061 2K

Size Classes of Organic Carbon in Seawater,
W73-13062 5B

Polychlorobiphenyls in North Atlantic Ocean Water,
W73-13178 5A

The New Method for the Determination of Cobalt in Sea Water by Solvent Extraction with 2-Nitroso-5-Diethylaminophenol,
W73-13183 5A

A Simultaneous Determination of Lead-210 and Polonium-210 in Sea Water,
W73-13184 5A

The Determination of Selenium in Sea Water by Gas Chromatography with Electron-Capture Detection,
W73-13186 5A

The Determination of Molybdenum in Sea Water by Hot Graphite Atomic Absorption Spectrometry After Concentration on p-Aminobenzylcellulose or Chitosan,
W73-13199 5A

A Literature Survey of Ocean Pollution,
W73-13211 5B

Precise Shipboard Determination of Dissolved Nitrogen, Oxygen, Argon, and Total Inorganic Carbon by Gas Chromatography,
W73-13255 5A

Hydrocarbons from Sea Water,
W73-13257 5A

Persistence of Virus and Bacteria in Seawater,
W73-13272 5C

Application of a Sulfate-Sensitive Electrode to Natural Waters,
W73-13276 5A

Chemical Composition of Ocean Using a Direct Measuring Oceanographic Electrochemical Probe,
W73-13294 2K

Iron-55 in the Human Populations of the World.
W73-13347 5B

Effect of Noncondensables in Sea Water Evaporators,
W73-13463 3E

SEALANTS
Feasibility of Plastic Foam Plugs for Sealing Leaking Chemical Containers,
W73-13019 5G

SEASONAL
Estimating Benefits to Improved Seasonal Water Supply Forecasts: A Case Study of Irrigation Benefits,
W73-13143 3F

Responses of Semidesert Grasses to Seasonal Rest,
W73-13318 4A

Navifacial Temperature and Salinity Along the Track From Samoa to Hawaii, 1957-1965,
W73-13435 2E

Low-Temperature Acclimation and the Seasonal Temperature Sensitivity of some Tropical Marine Fish,
W73-13453 5C

Warm Water Advection in the Southern Beaufort Sea August-September 1971,
W73-13466 2E

SEDIMENT DEPOSITION
Destruction of Organic Substance in Ooze Deposits, (In Russian),
W73-13584 5B

SEDIMENT DISCHARGE
Regime, Theory, and Methods of Calculation and Measurement of Sediments and Waste Waters (Rezhim, teoriya, metody rascheta i izmereniya nanosov i stochnykh vod).
W73-13045 2J

Sediment Yield of Streams in European Russia (Stok nanosov rek Yevropeyskoy territorii SSSR),
W73-13046 2J

Relation of Average Long-Term Suspended-Sediment Yield of Streams in European Russia to Physiographic Factors (Zavisimost' srednego mnogoletnego stoka vzveshennykh nanosov rek Yevropeyskoy territorii SSSR ot fiziko-geograficheski kh faktorov),
W73-13047 2J

Experiment in Determining Total Sediment Discharge (Suspended Load and Bed Load) (Opyt vychisleniya polnogo raskhoda nanosov (vzveshennykh i vlekomykh)),
W73-13049 2J

SEDIMENT TRANSPORT
Engineering Hydrology,
W73-13016 3B

A Study of Sediment Transport in Norwegian Glacial Rivers, 1969,
W73-13026 2J

Regime, Theory, and Methods of Calculation and Measurement of Sediments and Waste Waters (Rezhim, teoriya, metody rascheta i izmereniya nanosov i stochnykh vod).
W73-13045 2J

Calculation of Suspended-Sediment Transport by Mountain Streams (K voprosu o raschete transporta vzveshennykh nanosov gornymi rekami),
W73-13048 2J

Experiment in Determining Total Sediment Discharge (Suspended Load and Bed Load) (Opyt vychisleniya polnogo raskhoda nanosov (vzveshennykh i vlekomykh)),
W73-13049 2J

Experimental Investigation of Settling Velocity of Sediments (Eksperimental'noye issledovaniye gidravlicheskoy krupnosti nanosov),
W73-13050 2J

Variations in Grain Size of Bottom Sediments in Lowland and Mountain Streams (Izmenchivost' krupnosti donnykh otlozheniy ravninnykh i gornykh rek),

Ecological Effects of Offshore Dredging and Beach Nourishment: A Review,
W73-13290 5C

In Situ Activation Analysis of Marine Sediments with Californium-252,
W73-13295 2K

Radionuclide Decline in Columbia River Water.
W73-13345 5B

A Sediment Squeezer for Removal of Pore Waters Without Air Contact,
W73-13531 2J

The Occurrence and Distribution of Mercury in the Sediments of Petit Lac (Western Lake Geneva),
W73-13588 5B

SEDIMENTS (PORFUNDAL)

Oxidation Reduction Potentials, Oxygen Concentration and Oxygen Uptake of Profundal Sediments in a Eutrophic Lake,
W73-13599 5C

SEEDS

Methods for Seeding Three Perennial Wheatgrasses on Cheatgrass Ranges in Southern Idaho,
W73-13319 4A

SEICHES

The Effects of Several Weather Disturbances on the Seiches in Lake Travis, Texas,
W73-13060 2H

SEISMIC PROPERTIES

Transient Vibration Techniques to Determine Wave Velocities In-Situ,
W73-13055 2G

SEISMIC STUDIES

Transient Vibration Techniques to Determine Wave Velocities In-Situ,
W73-13055 2G

SEISMIC WAVES

Transient Vibration Techniques to Determine Wave Velocities In-Situ,
W73-13055 2G

SELECTIVITY

A Potassium-Selective Silicone-Rubber Membrane Electrode Based on a Neutral Carrier,
W73-13185 5A

SELENIUM

The Determination of Selenium in Sea Water by Gas Chromatography with Electron-Capture Detection,
W73-13186 5A

Atomic Emission Spectrometry with an Induction-Coupled High-Frequency Plasma Source. The Determination of Iodine, Mercury, Arsenic and Selenium,
W73-13254 5A

SELF-PURIFICATION

An Improved Quick-Field Method of Calculating Waste Water Dilution in Rivers (Usovershenstvovaniye ekspress-metoda rascheta razbavleniya stochnykh vod v rekakh),
W73-13054 5B

SEMIARID CLIMATES

Terrestrial Plant Ecology.
W73-13340 5B

SENSITIVITY ANALYSIS

Information Content of the Regional Mean,
W73-13145 2A

SEPARATION TECHNIQUES

Chromatographic Separation of Phenols Using an Acrylic Resin,
W73-13166 5A

Separation of NTA and EDTA Chelates by Thin-Layer Chromatography,
W73-13168 5A

Extraction and Gas Chromatographic Determination of Methyl, -Ethyl-, and Methoxyethylmercury (II) Halides,
W73-13182 5A

The Determination of Molybdenum in Sea Water by Hot Graphite Atomic Absorption Spectrometry After Concentration on p-Aminobenzylcellulose or Chitosan,
W73-13199 5A

Separation of Manganese, Iron, Cobalt, Nickel, Copper, Zinc and Cadmium by Reversed-Phase Chromatography Using Tri-N-Octylamine as the Stationary Phase and Applying a Gradient Elution Technique, (Extraktionschromatographische Trennung Von Mangan, Eisen, Kobalt, Nickel, Kupfer, Zink Und Cadmium Unter Verwendung Von Tri-n-Octylamin Als Stationare Phase Und Gradientelution),
W73-13234 5A

Analysis of Organic Constituents Present in Drinking Water,
W73-13240 5A

Effects of Fixation on the Extraction of Dieldrin and p,p'-DDT from Muscle Tissue,
W73-13247 5A

Gas-Liquid Chromatographic Separation of Sulfur from Chlorinated Pesticide Residues in Wastewater Samples,
W73-13263 5A

Chromatography of 48 Metal Ions on Stannic Arsenate and Plain Papers in Butanol-Nitric Acid Media,
W73-13281 5A

Gas Chromatographic Determination of Residues of Methylcarbamate Insecticides in Crops as Their 2,4-Dinitrophenyl Ether Derivatives,
W73-13282 5A

The Application of Modern Solvent Extraction Techniques to the Removal of Trace Quantities of Toxic Substances From Industrial Effluents,
W73-13422 5D

Differentiation of Mycobacterium tuberculosis from Other Mycobacteria by Susceptibility to Ethyl and Methyl Esters of p-Nitrobenzoic Acid,
W73-13513 5C

Analytical Applications of Polyamine-Polyurea Chelating Resins,
W73-13571 5A

Solute Separation by Continuous Bubble Fractionation,
W73-13638 5D

Continuous Bubble Fractionation: Part I, Theoretical Consideration,
W73-13639 5D

Continuous Bubble Fractionation: Part II, Effects of Bubble Size and Gas Rate,
W73-13640 5D

Continuous Bubble Fractionation: Part III, Experimental Evaluation of Flow Parameters,
W73-13641 5D

Evaluation and Development of Physical-Chemical Techniques for the Separation of Emulsified Oil from Water,
W73-13642 5D

SESSILE ALGAE

Chlorophyll Content and Primary Production of Sessile Algal Community in Mountain Stream Chigonozawa Running Close to Kiso Biological Station of the Kyoto University,
W73-13614 5C

SETTLING BASINS

Process Design Manual for Phosphorus Removal,
W73-13129 5D

SETTLING VELOCITY

Experimental Investigation of Settling Velocity of Sediments (Eksperimental'noye issledovaniye gidravlicheskoy krupnosti nanosov),
W73-13050 2J

An Elutriator Method for Particle-Size Analysis with Quantitative Silt Fractionation,
W73-13533 2J

SEVAN SHORE

Effect of Clear Cutting in the Water Regime of the Principal Forest Trees of the Sevan Shore, (In Russian),
W73-13593 4A

SEVIN

Avoidance of Pesticides by Grass Shrimp (Palaemonetes pugio),
W73-13173 5C

SEWAGE

Secondary Sewage Treatment in Pipeline Contactors,
W73-13077 5D

SEWAGE EFFLUENTS

Behavior of Detergents (ABS), Bacteria, and Dissolved Solids in Water-Saturated Soils,
W73-13560 5B

SEWAGE TREATMENT

Secondary Sewage Treatment in Pipeline Contactors,
W73-13077 5D

Process Design Manual for Upgrading Existing Wastewater Treatment Plants.
W73-13132 5D

Screening and Aerating Concentrator,
W73-13321 5D

Process for the Reduction of the Biochemical Oxygen Demand of Sewage, and for the Recovery of the Inherent Protein,
W73-13334 5D

SHAD

The Biology of the West African Shad Ethmalosa Fimbriata (Bowdich) in the Lagos Lagoon, Nigeria,
W73-13600 2H

SHAKE EXTRACTION

Comparative Extraction of Chlorinated Hydrocarbon Insecticides from Soils 20 Years after Treatment,
W73-13285 5B

SHELLFISH

A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W73-13298 5B

Laboratory Observations on the Early Growth of the Abalone, Haliotis Sorenseni, and the Effect of Temperature on Larval Develooment and Settling Success,
W73-13428 5C

SHELLFISH FARMING

A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W73-13298 5B

SHIPBOARD MEASUREMENTS

Precise Shipboard Determination of Dissolved Nitrogen, Oxygen, Argon, and Total Inorganic Carbon by Gas Chromatography,
W73-13255 5A

SHRIMP

Avoidance of Pesticides by Grass Shrimp (Palaemonetes pugio),
W73-13173 5C

SIEVE ANALYSIS

Sieve Load Equations and Estimates of Sample Size,
W73-13536 2J

SIEVE LOADS

Sieve Load Equations and Estimates of Sample Size,
W73-13536 2J

SILICA

A Reactive Silicate Budget for the Arctic Ocean,
W73-13061 2K

SILICATES

A Reactive Silicate Budget for the Arctic Ocean,
W73-13061 2K

Fixing Cation Interaction with Blister-Like Osmotic Swelling on Vermiculite Cleavages,
W73-13425 2G

SILICON

Evidence for Buffering of Dissolved Silicon in Fresh Waters,
W73-13238 5B

SILTS

Engineering Hydrology,
W73-13016 3B

An Elutriator Method for Particle-Size Analysis with Quantitative Silt Fractionation,
W73-13533 2

SILVER

Ion-Selective Carbon-Paste Electrodes for Halides and Silver (I) Ions,
W73-13187 5A

SILVER/SILVER CHLORIDE ELECTRODE

A Rugged Silver-Silver Chloride Electrode for Field Use,
W73-13193 7B

SIMULATION ANALYSIS

HYDRA: Dynamic Model for Urban Hydrologic Systems,

Application of a Simple Hydrologic Model for Rainfall-Runoff Relations of the Dalton Watershed,
W73-13362 2A

SITES

Final Environmental Statement Related to Operation of Surry Power Station Unit 1.
W73-13408 5G

Final Environmental Statement Related to the St. Lucie Plant Unit No. 1.
W73-13410 5G

Final Environmental Statement Related to the Continuation of Construction of Unit 2 and the Operation of Units 1 and 2 Millstone Nuclear Power Station.
W73-13411 5G

Final Environmental Statement Related to the Construction of Susquehanna Steam Electric Station Units 1 and 2.
W73-13412 5C

Final Environmental Statement Related to Construction of Nine Mile Point Nuclear Station Unit 2.
W73-13413 5C

KIMMING
Apparatus for Eliminating Oil Slicks from Large Bodies of Water,
W73-13337 5G

KYLIGHT POLARIZATION
Polarization: A Key to an Airborne Optical System for the Detection of Oil on Water,
W73-13167 5A

LIME
Slime Production by Pseudomonas Aeruginosa. II. A New Synthetic Medium and Cultural Conditions Suitable for Slime Production by Pseudomonas Aerginosa,
W73-13088 5C

LUDGE
Method for Treating Acid Water Containing Metallic Values,
W73-13335 5D

LUDGE DISPOSAL
Feasibility of Using Pulp Mill Sludge as an Additive to Corrugating Medium,
W73-13081 5E

LUDGE TREATMENT
Potential for the Use of Cobalt-60 Irradiation in the Treatment of Waste Waters,
W73-13401 5D

LUG TESTS
On the Analysis of 'Slug Test' Data,
W73-13369 2F

LURRY
Description and Use of an Underwater Television System on the Atlantic Continental Shelf,
W73-13559 7B

Effect on Wheat Yield and Nitrogen Uptake from Manures Made from Spent-Slurry,
W73-13601 3F

MALL WATERSHEDS
Application of a Simple Hydrologic Model for Rainfall-Runoff Relations of the Dalton Watershed,
W73-13362 2A

MAIL PREDATION
Predation on Largemouth Bass Embryos by the Pond Snail Viviparus Georgianus,
W73-13603 5C

MAILS
Influence of Phenol and Temperature on the Respiration of a Freshwater Snail Helisoma Trivolvis,
W73-13454 5C

NAKE RIVER (WASH)
Reactions of Canada Geese to Reservoir Impoundment on the Snake River in Washington,
W73-13082 6G

NOW COVER
Monitoring Snow Water Equivalent by Using Natural Soil Radioactivity,
W73-13382 2C

SNOW REMOVAL
Water Pollution and Associated Effects from Street Salting,
W73-13471 5B

SNOW SURVEYS
Monitoring Snow Water Equivalent by Using Natural Soil Radioactivity,
W73-13382 2C

SNOWFALL
Sulphate Deposition by Precipitation Into Lake Ontario,
W73-13270 5B

SNOWMOBILES
Ecological Effects of Snowmobiles,
W73-13113 4C

SNOWPACKS
Monitoring Snow Water Equivalent by Using Natural Soil Radioactivity,
W73-13382 2C

SOAP LAKE (WASH)
Postdepositional Osmotic Adjustments in Sediments from Soap Lake, Washington,
W73-13064 2J

SOCIAL ASPECTS
Treatment of Some of the Uncertainties Encountered in the Conduct of Hydrologic Cost-Effectiveness Evaluations,
W73-13154 6B

Sociological Considerations in Irrigation Water Management: Facing Problems of Water Quality Control,
W73-13307 5G

SOCIAL VALUES
Some Possible Changes in Future Social Values and Priorities: Strategic Implications for Water Resources Planning,
W73-13153 6B

SODIUM
Temperature-Dependence of Permeability to Water and to Sodium of the Gill Epithelium of the Eel Anguilla Anguilla,
W73-13475 5C

SODIUM CHLORIDE
Interacting Effects of pH, Temperature, and Salt Concentration on Growth and Survival of Vibrio Parahaemolyticus,
W73-13245 5C

On the Influence of Sodium on the Water Status of Sugar Beet,
W73-13393 3F

SODIUM WATER
Studies on Sodium Water for Irrigation. Effect of Addition of Cations: K, Ca or Mg,
W73-13192 3C

SOIL ALGAE
A Study of the Blue-Green Algae From Paddy Field Soils of India,
W73-13498 5C

SOIL ANALYSIS
Comparative Extraction of Chlorinated Hydrocarbon Insecticides from Soils 20 Years after Treatment,
W73-13285 5B

SOIL COLUMNS
Nitrogen Balance in Soil Columns Intermittently Flooded with Secondary Sewage Effluent,
W73-13116 5B

SOIL CONTAMINATION
Residue Determination of Ethylenethiourea (2-Imidazolidinethione) From Tomato Foliage, Soil, and Water,
W73-13259 5A

Soil Contamination. 2. Penetration of Radioactive Ions Present in Solutions Dumped on the Surface (Contamination Des Sols. Comportement Des Ions Radioactifs Dans Les Sols Non Stures),
W73-13417 5B

SOIL CONTAMINATION EFFECTS
Plant Accumulations of Radioactive Strontium with Special Reference to the Strontium-Calcium Relationship as Influenced by Nitrogen,
W73-13418 5B

SOIL DYNAMICS
Transient Vibration Techniques to Determine Wave Velocities In-Situ,
W73-13055 2G

SOIL FILTERS
Behavior of Detergents (ABS), Bacteria, and Dissolved Solids in Water-Saturated Soils,
W73-13560 5B

SOIL HUMIDITY
Apparatus for Remote Centralized Measurement of Soil Humidity by the Electrometric Method, (In Italian),
W73-13582 2G

SOIL MECHANICS
One-Dimensional Consolidation of a Clay Layer with Impeded Drainage Boundaries,
W73-13368 2G

SOIL MOISTURE
A Stochastic Model for the Occurrence of Moisture in Vadose Media,
W73-13074 2G

Studies on the Soil-Water System in the Field: II. Statistical Consideration on the Soil Moisture Content (in Japanese),
W73-13091 2G

Root Distribution and Soil Moisture Studies in Some Perennial Ryegrass and Phalaris Pastures on Southern Tablelands, South-eastern Australia,
W73-13110 2I

A Comparative Study of Soil Versus Follar Application of Ammonium Nitrate to Wheat under Different Moisture Regimes,
W73-13313 3F

Change in the Free Amino Acid Content in Cryptomeria Japonica Transplants Under Various Soil Moisture Conditions,
W73-13592 2K

SOIL PHYSICAL PROPERTIES
Physical Problems and their Amelioration in Salty Soils,
W73-13308 2G

SOIL TEXTURE
Pedogenic Calcite Accumulation in Arid and Semiarid Regions of the Indo-Gangetic Alluvial Plain of Erst-While Punjab (India)--Their Morphology and Origin,
W73-13311 2G

SOIL TREATMENT
Fixing Cation Interaction with Blister-Like Osmotic Swelling on Vermiculite Cleavages,
W73-13425 2G

SOIL TREATMENTS
Vertical Mulch Effects on Soil Water Storage,
W73-13436 2G

SOIL WATER
On the Uptake of Tritium by Soil Water and Groundwater,
W73-13372 2F

SOIL WATER MOVEMENT
A Numerical and Similarity Analysis of Infiltration Into Crusted Soils,
W73-13379 2G

SOIL-WATER-PLANT RELATIONSHIPS
Prairie Sandreed (Calamovilfa longifolia): Water Infiltration and Use,
W73-13312 2I

Plant Induced Soil Salinity Patterns in Two Saltbush (Atriplex SPP.) Communities,
W73-13316 3C

Characteristics of Hanford Soil and Aquatic Sediments.
W73-13342 5B

Plant Accumulations of Radioactive Strontium with Special Reference to the Strontium-Calcium Relationship as Influenced by Nitrogen,
W73-13418 5B

SOIL-WATER STORAGE
Vertical Mulch Effects on Soil Water Storage,
W73-13436 2G

SOIL WATER STRESS
Water Stress in 'Turoa' Red Clover Under 'Aotea' Wheat,
W73-13527 3F

SOILS
Nitrogen Balance in Soil Columns Intermittently Flooded with Secondary Sewage Effluent,
W73-13116 5B

Nitrogen-Fixing Blue-Green Algae of Soils, Rice Fields and Ephemeral Basins of the Southern Ukraine, (In Russian),
W73-13391 5C

The Soils of the Villecartier Forest,
W73-13604 2G

Solubility of Manganese in the Presence of Soil Chemicals,
W73-13645 5B

SOILS (CLAY LOAM)
Influence of Soil Bulk Density and Matric Pressure on Soil Resistance to Penetration,
W73-13127 2G

SOILS (PLOWED AND UNPLOWED)
Influence of Surface Soil Conditions on Drying in Early Spring,
W73-13098 3F

SOLAR RADIATION
Cloudiness as a Global Climatic Feedback Mechanism: The Effects on the Radiation Balance and Surface Temperature of Variations in Cloudiness,
W73-13441 2B

SOLUBILITY
Solubility of Manganese in the Presence of Soil Chemicals,
W73-13645 5B

SOLUTES
Simultaneous Transport of Solutes and Water Under Transient Unsaturated Flow Conditions,
W73-13380 2G

Solute Separation by Continuous Bubble Fractionation,
W73-13638 5D

SOLVENT EXTRACTIONS
Determination of Low Phosphate Concentrations in Seawater by an Isobutyl Acetate Extraction Procedure,
W73-13057 5A

Extraction and Gas Chromatographic Determination of Methyl, -Ethyl-, and Methoxyethylmercury (II) Halides,
W73-13182 5A

The New Method for the Determination of Cobalt in Sea Water by Solvent Extraction with 2-Nitroso-5-Diethylaminophenol,
W73-13183 5A

The Application of Modern Solvent Extraction Techniques to the Removal of Trace Quantities of Toxic Substances From Industrial Effluents,
W73-13422 5D

SOUNDING
Radar Sounding of the Abramov Glacier (Radiolokatsionnoye zondirovaniye lednika Abramova),
W73-13356 2C

SOUTH CAROLINA
Food of Largemouth Bass (Micropterus Salmoides) from a South Carolina Reservoir Receiving Heated Effluent,
W73-13083 5C

Ecological Comparisons of Thermally Affected Aquatic Environments,
W73-13439 5C

SOUTH CAROLINA (PRATERS CREEK)
Some Ecological Relationships of the Invertebrate Drift in Praters Creek, Pickens County, South Carolina,
W73-13107 2I

SOUTH DAKOTA
Water Resources and Geology of Mount Rushmore National Memorial, South Dakota,
W73-13522 2F

SOUTHERN NAIAD
Cadmium Toxicity and Accumulation in Southern Naiad,
W73-13251 5C

SOVIET CENTRAL ASIA
Glaciology of Soviet Central Asia (Glyatsiologiya Sredney Azii).
W73-13350 2C

SOXHLET EXTRACTION
Comparative Extraction of Chlorinated Hydrocarbon Insecticides from Soils 20 Years after Treatment,
W73-13285 5B

SPATIAL DISTRIBUTION
The Geographic Distribution of Freshwater Hirudinoidea in Canada,
W73-13170 5B

Evidence for Buffering of Dissolved Silicon in Fresh Waters,
W73-13238 5B

SPECIATION
The Geographic Distribution of Freshwater Hirudinoidea in Canada,
W73-13170 5B

SPECIES DIVERSITY INDEX
Benthic Macroinvertebrate Community Structure in a Great Plains Stream Receiving Feedlot Runoff,
W73-13180 5C

SPECTRAL DIFFUSIVITY
Study of Suspended Sediments in Reservoirs by the Method of Spectral Diffusivity (Izucheniye vzveshennykh nanosov v vodokhranilishchakh metodom spektral'noy yarkosti),
W73-13052 2J

SPECTROPHOTOMETRY
The New Method for the Determination of Cobalt in Sea Water by Solvent Extraction with 2-Nitroso-5-Diethylaminophenol,
W73-13183 5A

Colorimetric Assay for Carboxymethyloxysuccinate, A New Detergent Builder,
W73-13637 5A

SPERM
Toxicity of Methyl Mercury for Steelhead Trout Sperm,
W73-13250 5C

SPINACH
Effect of Substrate Humidity Conditions on Lettuce and Spinach Mineral Nutrition. 1. Effect of Humidity on Plant Yield (In Russian),
W73-13635 3F

SPORT FISH
Upper Mississippi River Comprehensive Basin Study, Appendix L--Fish and Wildlife Resources.
W73-13492 6B

SPRAY PONDS
Simplified Method for Determining Tower Drift Rate,
W73-13457 5D

SPRINKLER IRRIGATION
Productivity of Tall Wheatgrass and Great Basin Wildrye Under Irrigation on Greasewood-Rabbitbrush Range Site,
W73-13314 3

ST. THOMAS (V I)
A Survey of the Water Resources of St. Thomas, Virgin Islands,
W73-13516 2

STABLE ISOTOPES
Relationship Between the Carbon Isotope Composition of Soil CO2 and Dissolved Carbonate Species in Groundwater,
W73-13360 2

STANDARDS
Environmental Legislation: How it Affects Fossil-Fuel-Fired Power-Generating Equipment,
W73-13474 6

STATE GOVERNMENTS
Upper Mississippi River Comprehensive Basin Study, Appendix O--State and Federal Water Laws, Policies, and Programs.
W73-13495 6

TATISTICAL METHODS
Errors of Measurement, Precision, Accuracy and the Statistical Comparison of Measuring Instruments,
W73-13194 7A

Some Problems Associated with the Analysis of Multiresponse Data,
W73-13195 7C

Use of Cross Correlation Between Hydrological Time Series to Improve Estimates of Lag One Autoregressive Parameters,
W73-13364 7C

TATISTICAL MODELS
Some Problems in Stochastic Hydrology,
W73-13039 2A

EMPERATURE
Effects of Incubation Temperature on Survival of Largemouth Bass Eggs,
W73-13080 5C

An Analysis of Sampling-Frequency Alternatives for Fitting a Daily Stream-Temperature Model,
W73-13142 4A

Interacting Effects of pH, Temperature, and Salt Concentration on Growth and Survival of Vibrio Parahaemolyticus,
W73-13245 5C

Laboratory Observations on the Early Growth of the Abalone, Haliotis Sorenseni, and the Effect of Temperature on Larval Develooment and Settling Success,
W73-13428 5C

Navifacial Temperature and Salinity Along the Track From Samoa to Hawaii, 1957-1965,
W73-13435 2E

Cloudiness as a Global Climatic Feedback Mechanism: The Effects on the Radiation Balance and Surface Temperature of Variations in Cloudiness,
W73-13441 2B

Temperature Profiles in Condensers,
W73-13445 3E

Heat-Transfer Agents for High-Temperature Systems,
W73-13446 8C

Heating and Cooling in Batch Processes,
W73-13448 5G

Measuring Thermal Plumes in Three Dimensions,
W73-13450 5B

The Effect of Temperature on the Development Rate of the Major Life Stages of Diaptomus Pallidus Herrick,
W73-13456 5C

Inverse Compensation for Temperature in Oxygen Consumption of the Hylid Frog Pseudacris Triseriata,
W73-13458 5C

Effects of Temperature, Salinity, and Dissolved Oxygen on the Survival of Striped Bass Eggs and Larvae,
W73-13460 5C

The Effect of Temperature on the Number of Circulating Hemocytes in the California Sea Hare, Aplysia California,
W73-13461 5C

Temperature-Dependence of Permeability to Water and to Sodium of the Gill Epithelium of the Eel Anguilla Anguilla,
W73-13475 5C

On Properties of Seawater Defined by Temperature, Salinity and Pressure,
W73-13477 2K

The Use of Water Quality Simulation Models in the Analysis of the Thermal Effects Problem,
W73-13479 5B

TEMPERATURE BALANCE
Studies on the Temperature and Water Balance of Chosen Plant Species of the Dry Area of Santa Marta (Colombia), (In Spanish),
W73-13385 2D

TEMPERATURE CONTROL
An Aquarium Temperature Control System for Field Stations,
W73-13079 5C

TEMPERATURE EFFECTS
Experimental Study of the Effect of Temperature on Some Pike Parasites, (In Russian),
W73-13399 5C

TEMPERATURES
Effect of Temperatures and Water Table Depth on the Growth of Creeping Bentgrass Roots,
W73-13105 2I

TEMPORAL DISTRIBUTION
Evidence for Buffering of Dissolved Silicon in Fresh Waters,
W73-13238 5B

TENNESSEE RIVER
Developments in Applications of Remote Sensing to Hydrologic Modeling,
W73-13146 2E

TENSIOMETERS
Improved Mercury Well for Multiple Tensiometer Systems,
W73-13523 7B

TERTIARY TREATMENT
Process Design Manual for Suspended Solids Removal.
W73-13130 5D

Inorganic Nitrogen Removal From Wastewater: Effect on Phytoplankton Growth in Coastal Marine Waters,
W73-13179 5C

TESTING PROCEDURES
Improved Water Analysis Kit,
W73-13297 7B

TEXAS
Methodology for Assessment of Urban Water Planning Objectives,
W73-13017 3D

The Effects of Several Weather Disturbances on the Seiches in Lake Travis, Texas,
W73-13060 2H

Water Resources Data for Texas, 1972: Part 1, Surface Water Records.
W73-13069 7C

Subjective Planning: A Model for Water Resource Development,
W73-13150 6A

Reliability: A New Parameter in Urban Water Quality Management,
W73-13156 5D

Ground-Water Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1972.
W73-13515 4B

THAILAND
Freshwater Diatoms in Thailand,
W73-13570 5A

THALLIUM
Determination of Traces of Thallium in Urine by Anodic Stripping AC Voltammetry,
W73-13279 5A

THEORETICAL ANALYSIS
On the Wind-Driven Circulation of a Stratified Ocean,
W73-13429 5B

THERMAL CONDUCTIVITY
Measurement of Groundwater Flow Using an In-Situ Thermal Probe,
W73-13013 2F

Heat-Transfer Agents for High-Temperature Systems,
W73-13446 8C

THERMAL PLUMES
Measuring Thermal Plumes in Three Dimensions,
W73-13450 5B

THERMAL POLLUTION
Food of Largemouth Bass (Micropterus Salmoides) from a South Carolina Reservoir Receiving Heated Effluent,
W73-13083 5C

Flow Properties of Submerged Heated Effluents in a Waterway,
W73-13084 5B

Effect of Thermal Shock on Vulnerability to Predation in Juvenile Salmonids. II. A Dose Response by Rainbow Trout to Three Shock Temperatures,
W73-13291 5C

THERMAL POLLUTION

Freshwater Ecology.
W73-13341 5B

Marine Sciences.
W73-13343 5B

Heat Recovery in Process Plants,
W73-13431 5D

Ecological Comparisons of Thermally Affected Aquatic Environments,
W73-13439 5C

Dynamic Cooling.
W73-13449 5B

Measuring Thermal Plumes in Three Dimensions,
W73-13450 5B

Influence of Phenol and Temperature on the Respiration of a Freshwater Snail Helisoma Trivolvis,
W73-13454 5C

Research Needs on Waste Heat Transfer from Large Sources into the Environment.
W73-13473 5G

Thermal Effects on Aquatic Organisms, Annotated Bibliography of 1971 Literature,
W73-13478 5C

The Use of Water Quality Simulation Models in the Analysis of the Thermal Effects Problem,
W73-13479 5B

THERMAL POWER PLANTS
Geothermal Power Still Iffy,
W73-13433 3E

THERMAL POWERPLANTS
Geothermal Energy--Resources, Production, Stimulation.
W73-13214 6D

Introduction: The Energy Outlook,
W73-13215 6D

Worldwide Status of Geothermal Resources Development,
W73-13216 6D

Assessment of U.S. Geothermal Resources,
W73-13217 6D

Characteristics of Geothermal Resources,
W73-13218 3E

Explorations for Geothermal Resources,
W73-13219 3E

Steam Production at the Geysers Geothermal Field,
W73-13220 3E

Design and Operation of the Geysers Power Plant,
W73-13221 8C

The Vapor-Turbine Cycle for Geothermal Power Generation,
W73-13222 8C

Environmental Impact of Geothermal Development,
W73-13224 6G

Stimulation of Geothermal Systems,
W73-13225 8C

Explosive Stimulation of Hydrothermal Reservoirs,
W73-13227 8H

Induction and Growth of Fractures in Hot Rock,
W73-13228 8H

Geothermal Resources Research,
W73-13232 6D

Research Needs on Waste Heat Transfer from Large Sources into the Environment.
W73-13473 5G

THERMAL PROBE
Measurement of Groundwater Flow Using an In-Situ Thermal Probe,
W73-13013 2F

THERMAL SHOCK
Effect of Thermal Shock on Vulnerability to Predation in Juvenile Salmonids. II. A Dose Response by Rainbow Trout to Three Shock Temperatures,
W73-13291 5C

THERMAL STRATIFICATION
On the Wind-Driven Circulation of a Stratified Ocean,
W73-13429 5B

THERMAL STRESS
Thermal Effects on Eggs, Larvae and Junveniles of Bluegill Sunfish,
W73-13020 5C

Effects of Incubation Temperature on Survival of Largemouth Bass Eggs,
W73-13080 5C

Effect of Thermal Shock on Vulnerability to Predation in Juvenile Salmonids. II. A Dose Response by Rainbow Trout to Three Shock Temperatures,
W73-13291 5C

THERMODYNAMIC BEHAVIOR
Heat-Transfer Agents for High-Temperature Systems,
W73-13446 8C

THIN LAYER CHROMATOGRAPHY
Separation of NTA and EDTA Chelates by Thin-Layer Chromatography,
W73-13168 5A

THIN-LAYER PLATES
A New Chromogenic Reagent for the Detection of Phenolic Compounds on Thin-Layer Plates,
W73-13169 5A

THIOACETAMIDE
Potentiometric Studies on Thioacetamide by Means of a Sulphide Ion-Selective Membrane Electrode,
W73-13197 5A

THIOLS
Micro and Semimicro Determination of Thiols with Ion-Selective Electrodes,
W73-13289 5A

TIDAL MARSHES
Tidal Marsh Ciliates (Protozoa): Morphology, Ecology, Systematics,
W73-13591 2H

TIDES
Brief Field Guide to Intertidal Sediments, Minas Basin, Nova Scotia,
W73-13204 2L

TIME SERIES ANALYSIS
Use of Cross Correlation Between Hydrological Time Series to Improve Estimates of Lag One Autoregressive Parameters,
W73-13364 7C

TISSUE HYDRATION (PLANTS)
Effect of Tissue Hydration on Nitrogen Metabolism in Barley Leaves, (In Russian),
W73-13577 3F

TORCH LAKE (MICH)
Factors Controlling Copper (II) Concentrations in the Keweenaw Waterway,
W73-13010 5B

TOURISM
Upper Mississippi River Comprehensive Basin Study, Appendix K--Recreation.
W73-13491 6B

TOXICITY
Acute Effects of Administration of Methyl Mercuric Chloride on Tissues and Enzyme Activity in Channel Catfish (Ictalurus punctatus),
W73-13029 5C

Synergistic Bio-Effects of Oil and Irradiation in an Aquatic Organism, Taricha Granulosa,
W73-13248 5C

Toxicity of Methyl Mercury for Steelhead Trout Sperm,
W73-13250 5C

Cadmium Toxicity and Accumulation in Southern Naiad,
W73-13251 5C

Comparative Toxicity of 29 Nitrosalicylanilides and Related Compounds to Eight Species of Fish,
W73-13288 5C

Toxicity of 33NCS (3'-Chloro-3-Nitrosalicylanilide) to Freshwater Fish and Sea Lamprey,
W73-13293 5C

TOXICITY (ACUTE)
The Effects of Methoxychlor on Fishes: I. Acute Toxicity and Breakdown Studies,
W73-13122 5C

TOXICITY RATINGS
A Method for Rting Chemicals for Potency Against Fish and Other Organisms,
W73-13269 5C

TRACE ELEMENTS
Determination of Ag, Hg, and Arsenic in Seawater.
W73-13346 5B

Contents of Trace Elements in Lucerne (Medicago Varia Mart) in Relation to Growth, Development and Weather Conditions in 3 Years of Experiment, (In German),
W73-13396 5B

Activation Analysis of Trace Elements in Biological Materials, (Analyse Par Activation De Mecroquantites D'Elements Dans Les Materiaux Biologique),
W73-13420 5A

TRACE LEVELS
Kinetic Microdetermination of Mercury in Natural Waters and Biological Materials,
W73-13271 5A

Atomic Absorption Spectrometry of Traces of Tri- and Hexavalent Chromium,
W73-13275 5A

Micro and Semimicro Determination of Thiols with Ion-Selective Electrodes,
W73-13289 5A

ACERS
sotophic Tracer Techniques for Identification f Sources of Nitrate Pollution,
V73-13201 5B

On the Uptake of Tritium by Soil Water and Groundwater,
773-13372 2F

Hydraulic Sand-Model Study of the Cyclic low of Salt Water in a Coastal Aquifer,
773-13558 2L

ANSPIRATION
hysiology of Daily Transpiration Rhythm in Woody Plants,
773-13095 2D

heritance and Physiological Effects of Sto-atal Frequency in Barley,
773-13125 3F

tudies on the Temperature and Water Balance f Chosen Plant Species of the Dry Area of anta Marta (Colombia), (In Spanish),
773-13385 2D

ifferential Stomatal Response Between C3 nd C4 Species to Atmospheric CO2 Concen-ation and Light,
773-13398 2D

Digital Registration System for Net notosynthesis and Transpiration Measure-ents in the Field and an Associated Analysis Errors,
773-13597 2D

rst Data on the Water Regime of Plants From outhern Mongolia, (In Russian),
773-13607 2I

NSPORTATION
easibility of Plastic Foam Plugs for Sealing eaking Chemical Containers,
73-13019 5G

ATMENT FACILITIES
ost of Waste Water Pollution Abatement in oultry Processing and Rendering Plants in eorgia,
73-13003 5D

ctivated Sludge Modifications for Enhance-ent of Trickling Filter Plant Performance. I. esign, Operation, and BOD Removal in the nits. II. Nitrification,
73-13086 5D

ariations in Characteristics of Wastewater In-ent at the Mason Farm Wastewater Treat-nt Plant, Chapel Hill, North Carolina,
73-13087 5D

ocess Design Manual for Suspended Solids emoval.
73-13130 5D

ocess Design Manual for Carbon Adsorption.
73-13131 5D

ocess Design Manual for Upgrading Existing astewater Treatment Plants.
73-13132 5D

TREMATODES
Study of Parasites in Fishes of the Sind River: I. Trematodes of Hilsa ilisha (Ham.),
W73-13634 5C

TRICHOPTERA LARVAE
Productivity and Distribution of Trichoptera Larvae in a Colorado Mountain Stream,
W73-13124 2I

TRICKLING FILTERS
Activated Sludge Modifications for Enhancement of Trickling Filter Plant Performance. I. Design, Operation, and BOD Removal in the Units. II. Nitrification,
W73-13086 5D

TRITIATED WATER
The Effect of Ground Water Level on Water Movement in Peat: A Study Using Tritiated Water,
W73-13093 4A

TRITIUM
Freshwater Ecology.
W73-13341 5B

On the Uptake of Tritium by Soil Water and Groundwater,
W73-13372 2F

TROPHIC LEVEL
The Influence of Environmental Factors on the Distribution of Freshwater Algae: An Experimental Study. I. Introduction and the Influence of Calcium Concentration,
W73-13546 5C

TROPICAL REGIONS
Low-Temperature Acclimation and the Seasonal Temperature Sensitivity of some Tropical Marine Fish,
W73-13453 5C

TUBES
Fritted Disc Funnels and Tapered Stainless Steel Tubes and Stoppers for Use in Pesticide Residue Analysis,
W73-13246 5A

TULAREMIA FOCI
Natural Tularemia Foci Structure in the Floodlands of Small and Medium Rivers. II. Epizootologic Nature of Elementary Foci (In Russian),
W73-13628 5C

TUNGSTEN BRONZE ELECTRODES
Chelometric Titrations of Metal Cations Using the Tungsten Bronze Electrode,
W73-13278 5A

TURBINES
The Vapor-Turbine Cycle for Geothermal Power Generation,
W73-13222 8C

TURKEY (DIYARBAKIR)
Intestinal Infection Carrier Survey in Diyarbakir: I. (In Turkish),
W73-13631 5C

TURNOVERS
The Fall Overturn and Winter Cooling in Lake Superior,
W73-13059 2H

UKRAINE
A New Nematode Species in Carp Waters of the West Regions of Ukraine,
W73-13624 5C

UKRAINE (USSR)
Nitrogen-Fixing Blue-Green Algae of Soils, Rice Fields and Ephemeral Basins of the Southern Ukraine, (In Russian),
W73-13391 5C

UNDERGROUND SURVEYS
Underground Surveys with Borehold Cameras,
W73-13566 4B

UNDERWATER
Description and Use of an Underwater Television System on the Atlantic Continental Shelf,
W73-13559 7B

UNSATURATED FLOUR
Literature Pertaining to Water Quality and Quantity in Unsaturated Porous Media,
W73-13302 5B

UNSATURATED FLOW
Simultaneous Transport of Solutes and Water Under Transient Unsaturated Flow Conditions,
W73-13380 2G

UNSATURATED SOILS
Literature Pertaining to Water Quality and Quantity in Unsaturated Porous Media,
W73-13302 5B

UNSTEADY FLOW
Technique for Implicit Dynamic Routing in Rivers with Tributaries,
W73-13363 2E

Equation for One-Dimensional Vertical Flow of Groundwater: 1. The Rigorous Theory,
W73-13377 2F

Simultaneous Transport of Solutes and Water Under Transient Unsaturated Flow Conditions,
W73-13380 2G

UPPER MISSISSIPPI RIVER BASIN
Upper Mississippi River Comprehensive Basin Study, Appendix A--History of Investigation.
W73-13481 6B

Upper Mississippi River Comprehensive Basin Study, Appendix B--Aesthetic and Cultural Values.
W73-13482 6B

Upper Mississippi River Comprehensive Basin Study, Appendix C--Climatology and Meteorology.
W73-13483 6B

Upper Mississippi Comprehensive Basin Study, Appendix D--Surface Water Hydrology.
W73-13484 6B

Upper Mississippi Comprehensive Basin Study, Appendix E--Ground Water and Geology.
W73-13485 6B

Upper Mississippi River Comprehensive Basin Study, Appendix F--Mineral Resources.
W73-13486 6B

Upper Mississippi River Comprehensive Basin Study, Appendix G--Fluvial Sediment.
W73-13487 6B

Upper Mississippi River Comprehensive Basin Study, Appendix H--Water Supply and Quality Control.
W73-13488 6B

Upper Mississippi River Comprehensive Basin Study, Appendix I--Flood Control.
W73-13489 6B

UPPER MISSISSIPPI RIVER BASIN

Upper Mississippi River Comprehensive Basin Study, Appendix J--Navigation.
W73-13490 6B

Upper Mississippi River Comprehensive Basin Study, Appendix P--Economic Base Study and Projections.
W73-13496 6B

URALS (USSR)
Characteristics of Diatoms of Present-Day Glacial Lakes of the Polar Urals,
W73-13613 2H

URBAN ECOLOGY
Evaluation of Discontinuities in Regional Population Projections,
W73-13006 6B

URBAN HYDROLOGY
HYDRA: Dynamic Model for Urban Hydrologic Systems,
W73-13012 4A

The Effect of Urbanization on Runoff Quantity,
W73-13032 4C

URBAN PLANNING
A Procedure for Assessing Water Resources for Urban Planning,
W73-13035 6A

URBAN RUNOFF
Pollution of Karst Aquifers,
W73-13203 5B

URBAN WATER RESOURCES
Regional Water Resource Planning for Urban Needs: Part II (Appendices),
W73-13015 6A

Subjective Planning: A Model for Water Resource Development,
W73-13150 6A

URBANIZATION
Methodology for Assessment of Urban Water Planning Objectives,
W73-13017 3D

The Effect of Urbanization on Runoff Quantity,
W73-13032 4C

A Procedure for Assessing Water Resources for Urban Planning,
W73-13035 6A

UREA DECOMPOSITION
Competition for Urea Among Estuarine Microorganisms,
W73-13108 5C

URINE
Parathion Exposure Studies. A Gas Chromatographic Method for the Determination of Low Levels of p-Nitrophenol in Human and Animal Urine,
W73-13174 5A

Determination of Traces of Thallium in Urine by Anodic Stripping AC Voltammetry,
W73-13279 5A

USSR (ASTRAKHAN)
Effect of Waste Water from the Astrakhan Cellulose-Pasteboard Plant on Soil Properties,
W73-13315 5D

UTAH
A Comparison of Consumer's Surplus and Monopoly Revenue Estimates of Recreational Value for Two Utah Waterfowl Marshes,
W73-13018 6B

Effect of Plant Moisture Stress on Carbohydrate and Nitrogen Content of Big Sagebrush,
W73-13309 2I

The Plant Ecology of Utah's Desert Rangelands,
W73-13310 2I

Irrigation Management for Control of Quality of Irrigation Return Flow,
W73-13469 5G

VACATION HOMES
Attitudes of Riparians Towards Their Lake Environments: A Study of Lake Wyola and Damon Pond, Massachusetts,
W73-13007 6A

VADOSE MEDIA
A Stochastic Model for the Occurrence of Moisture in Vadose Media,
W73-13074 2G

VAPOR TURBINES
The Vapor-Turbine Cycle for Geothermal Power Generation,
W73-13222 8C

VARIABILITY
Variations in Grain Size of Bottom Sediments in Lowland and Mountain Streams (Izmenchivost' krupnosti donnykh otlozheniy ravninnykh i gornykh rek),
W73-13051 2J

Evidence for Buffering of Dissolved Silicon in Fresh Waters,
W73-13238 5B

VEGETATION
Plutonium Studies.
W73-13344 5B

The Flora and Vegetation of Pond-Banks in the Southern Part of the Entre-Sambre-Et-Meuse,
W73-13615 2I

VELOCITY
Thermally-Driven Linear Vortex,
W73-13443 8B

VENICE (ITALY)
Subsidence of the Venice Area During the Past 40,000 Yr,
W73-13526 2F

VERMICULITE
The Soils of the Villecartier Forest,
W73-13604 2G

VERMONT
Monitoring Snow Water Equivalent by Using Natural Soil Radioactivity,
W73-13382 2C

VERTICAL DISTRIBUTION
The Vertical Distribution of Some Ciliated Protozoa in the Plankton of a Eutrophic Pond During Summer Stratification,
W73-13101 5C

Distribution and Background Levels of Mercury in Sediment Cores From Selected Wisconsin Lakes,
W73-13264 5B

VIBRIO-PARAHAEMOLYTICUS
Studies on Vibrio Parahaemolyticus in Korea
Coastal Waters: I. The Distribution of V
Parahaemolyticus (In Korean),

W73-13640 5D

Continuous Bubble Fractionation: Part III, Experimental Evaluation of Flow Parameters,
W73-13641 5D

Evaluation and Development of Physical-Chemical Techniques for the Separation of Emulsified Oil from Water,
W73-13642 5D

Effect of pH Adjustment Upon Activated Carbon Adsorption of Dissolved Organics from Industrial Effluents,
W73-13646 5D

Treatment of Glue Factory Wastes by Physiocochemical Processes,
W73-13647 5D

Surface Adsorption: A Promising Approach for the Treatment of Tannery Effluents,
W73-13648 5D

WATER ALLOCATION (POLICY)
Reservoir Management: Optimal Pricing and Rationing Policies under Uncertainty,
W73-13141 4A

Decision Making in Water Resource Allocation,
W73-13301 6B

WATER ANALYSIS
Determination of Low Phosphate Concentrations in Seawater by an Isobutyl Acetate Extraction Procedure,
W73-13057 5A

A New Method for Determining the Total Carbonate Ion Concentration in Saline Waters,
W73-13063 2K

The Polarographic Determination of Trace Amounts of Cyanide,
W73-13067 5A

Enzymatic NH3-N Determination: A Specific Method for the Determination of Ammonia in Water and Sediments,
W73-13068 5A

Analysis of Some Inorganic Constituents in Well Waters and Their Sediments,
W73-13151 4B

A Simple Coulometric Method for the Determination of Chloride in Natural Water,
W73-13181 5A

A Simultaneous Determination of Lead-210 and Polonium-210 in Sea Water,
W73-13184 5A

WATER ANALYSIS

The Determination of Selenium in Sea Water by Gas Chromatography with Electron-Capture Detection,
W73-13186 5A

Atomic Absorption Inhibition Titration of Orthophosphate and Polyphosphates,
W73-13198 5A

Hydrocarbons from Sea Water,
W73-13257 5A

Gas-Liquid Chromatographic Separation of Sulfur from Chlorinated Pesticide Residues in Wastewater Samples,
W73-13263 5A

Kinetic Microdetermination of Mercury in Natural Waters and Biological Materials,
W73-13271 5A

Improved Water Analysis Kit,
W73-13297 7B

A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W73-13298 5B

Characteristics of Hanford Soil and Aquatic Sediments.
W73-13342 5B

Determination of Ag, Hg, and Arsenic in Seawater.
W73-13346 5B

Activation Analysis of Trace Elements in Biological Materials, (Analyse Par Activation De Mecroquantites D'Elements Dans Les Materiaux Biologique),
W73-13420 5A

A Portable Sampler for Collecting Water Samples from Specific Zones in Uncased or Screened Wells,
W73-13557 4B

Water: Examination, Assessment, Conditioning, Chemistry, Bacteriology, Biology,
W73-13573 5A

Colorimetric Assay for Carboxymethyloxysuccinate, A New Detergent Builder,
W73-13637 5A

WATER BALANCE

Concerning the Calculation of Level Veriation of Cutoff Water Balance,
W73-13163 4A

Dew: An Addition to the Hydrologic Balance of Douglas Fir,
W73-13366 2I

Studies on the Temperature and Water Balance of Chosen Plant Species of the Dry Area of Santa Marta (Colombia), (In Spanish),
W73-13385 2D

Data on the Water Balance of Some Xerothermic Terrestrial Lichens,
W73-13397 2I

WATER-BEARING ZONES

A Portable Sampler for Collecting Water Samples from Specific Zones in Uncased or Screened Wells,
W73-13557 4B

WATER CHEMISTRY

A Reactive Silicate Budget for the Arctic Ocean,
W73-13061 2K

Effects of Temperature and Chemical Treatments on the Chemical Composition of Alkaline Water,
W73-13191 5G

Relationship Between the Carbon Isotope Composition of Soil CO2 and Dissolved Carbonate Species in Groundwater,
W73-13360 2K

Hydrochemical Environments of Carbonate Terrains.
W73-13361 2K

WATER CIRCULATION

Drogue Measurements of the Circulation in Grand Traverse Bay, Lake Michigan,
W73-13033 2H

WATER CONSUMERS

Reservoir Management: Optimal Pricing and Rationing Policies under Uncertainty,
W73-13141 4A

WATER CONVEYANCE

Proposed Central Arizona Project (Final Environmental Statement). Available from the National Technical Information Service as EIS-AZ-72-5357-F1. Bureau of Reclamation, Boulder City, Nevada. (FES 72-35) Septem ber 1972, 597 p. Maps. 203 ref.
W73-13552 4A

WATER DEMAND

Preliminary Study of Potential Sites for Water-Supply Reservoirs in West and Southeast Alabama,
W73-13041 6D

Upper Mississippi River Comprehensive Basin Study, Appendix Q--Framework for Development.
W73-13497 6B

WATER DISTRIBUTION (APPLIED)

A Minimum Cost Water Distribution Network,
W73-13071 4A

Design of Optimal Water Distribution Networks Using Dynamic Programming,
W73-13072 4A

An Interactive Design System for Water Distribution Networks,
W73-13073 4A

WATER EQUIVALENT

Monitoring Snow Water Equivalent by Using Natural Soil Radioactivity,
W73-13382 2C

WATER FLUX

The Effect of water and Salt Fluxes on the Transroot Potential in Helianthus annuus,
W73-13066 2I

WATER HYACINTH

Pathogenicity of Fungi and Bacteria from India to Hydrilla and Waterhyacinth,
W73-13502 5C

Pathogenicity of Rhizoctonia Solani to Aquatic Plants,
W73-13503 5C

WATER LAW

A Decade of Judicial Developments and Changes in Colorado Water Law: 1960-1970,
W73-13070 6E

Upper Mississippi River Comprehensive Basin Study, Appendix O--State and Federal Water Laws, Policies, and Programs
W73-13495 6B

WATER LEVEL

Concerning the Calculation of Level Veriation of Cutoff Water Balance,
W73-13163 4A

WATER LEVELS

Water levels and Spring Discharges for Selected Wells and Springs in Nevada, 1966-69,
W73-13043 4B

The Effect of Ground Water Level on Water Movement in Peat: A Study Using Triuated Water,
W73-13093 4A

WATER LOSS

Water Loss From Cut Grass With Special Reference to Hay-Making,
W73-13119 3F

WATER MANAGEMENT (APPLIED)

Institutional Requirements for Optimal Water Quality Management in Arid Urban Areas,
W73-13002 5G

The Margin of Safety for Compensating Losses Due to Uncertainties in Hydrological Statistics,
W73-13157 6B

Sociological Considerations in Irrigation Water Management: Facing Problems of Water Quality Control,
W73-13307 5G

Groundwater: From Windmills to Comprehensive Public Management,
W73-13505 6E

Rights to Nebraska Streamflows: An Historical Overview with Recommendations,
W73-13506 6E

WATER POLICY

Upper Mississippi River Comprehensive Basin Study, Appendix O--State and Federal Water Laws, Policies, and Programs.
W73-13495 6B

WATER POLLUTION

A Literature Survey of Ocean Pollution,
W73-13211 5B

Coliforms, Fecal Coliforms, and Fecal Streptococci as Indicators of Water Pollution,
W73-13262 5B

WATER POLLUTION CONTROL

Regional Water Resource Planning for Urban Needs: Part II (Appendices),
W73-13015 6A

An Act Prohibiting the Pollution Discoloration, Contamination, Clogging, or Diversion of Public Streams.
W73-13650 6E

WATER POLLUTION EFFECTS

Acute Effects of Administration of Methyl Mercuric Chloride on Tissues and Enzyme Activity in Channel Catfish (Ictalurus punctatus),
W73-13029 5C

Aquatic Organisms and Heavy Metals in Missouri's New Lead Belt,
W73-13037 5C

Extensive Oxygen Depletion in Mobile Bay, Alabama,
W73-13065 5C

Trends in Methodology for Evaluation of Effects of Pollutants on Marine Organisms and Ecosystems,
W73-13171 5C

Glucose Flux at the Sediment-Water Interface of Toronto Harbour, Lake Ontario, With Reference to Pollution Stress,
W73-13236 5B

Influence of Sulfite on Growth, Slime, and Fluoresecent Pigment Formation by Pseudomonas Aeruginosa,
W73-13237 5C

Synergistic Bio-Effects of Oil and Irradiation in an Aquatic Organism, Taricha Granulosa,
W73-13248 5C

A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W73-13298 5B

Freshwater Vertebrate and Invertebrate Ecology of Amchitka Island. July 1, 1971-June 30, 1972,
W73-13406 5C

ATER POLLUTION SOURCES

A Prototype High Seas Oil Recovery System: Phase I--System Development, Vol. III,
W73-13040 5G

Nitrification and Denitrification - A Selected Bibliography,
W73-13085 5B

Salt Pickup from Agricultural Lands in the Grand Valley of Colorado,
W73-13202 5B

Pollution of Karst Aquifers,
W73-13203 5B

Sulphate Deposition by Precipitation Into Lake Ontario,
W73-13270 5B

A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W73-13298 5B

Aquatic, Bioenvironmental Studies in the Columbia River at Hanford 1945-1971. A Bibliography with Abstracts,
W73-13409 5B

Effects of Highway De-Icing Salts on Groundwater and Water Supplies in Massachusetts,
W73-13525 5B

Effects of Phosphorus Application Rate, Soil Properties, and Leaching Mode on P-32 Movement in Soil Columns,
W73-13553 5B

An Act Prohibiting the Pollution Discoloration, Contamination, Clogging, or Diversion of Public Streams.
W73-13650 6E

ATER POLLUTION TREATMENT

Uptake of Mercury by Yeast Cells,
W73-13030 5D

WATER PROPERTIES

Improved Water Analysis Kit,
W73-13297 7B

Structure and Properties of Water and Their Significance for Biological Systems, (In Czech),
W73-13392 2I

WATER PURIFICATION

Water Purifying Apparatus,
W73-13326 5D

Liquid Filtering Apparatus,
W73-13327 5D

Apparatus for the Purification of Waste Water,
W73-13328 5D

Multi-Stage Flash Distillation Process,
W73-13336 3A

WATER QUALITY

Institutional Requirements for Optimal Water Quality Management in Arid Urban Areas,
W73-13002 5G

Quality of Surface Waters of the United States, 1968: Part II. Pacific Slope Basins in California.
W73-13200 2K

Water Resources of Broward County, Florida,
W73-13209 2A

Improved Water Analysis Kit,
W73-13297 7B

On Multidisciplinary Research on the Application of Remote Sensing to Water Resources Problems.
W73-13299 5A

Literature Pertaining to Water Quality and Quantity in Unsaturated Porous Media,
W73-13302 5B

Clogging in Simulated Glacial Aquifers Due to Artificial Recharge,
W73-13374 4B

Maps Showing Areas in the San Francisco Bay Region where Nitrate, Boron, and Dissolved Solids in Ground Water May Influence Local or Regional Development,
W73-13520 7C

Electrophoretic Evaluation and Process Control,
W73-13547 5F

Floating Aerator,
W73-13548 5F

A Portable Sampler for Collecting Water Samples from Specific Zones in Uncased or Screened Wells,
W73-13557 4B

WATER QUALITY CONTROL

Water Pollution: Environmental Impacts and Means of Control,
W73-13078 5G

Sociological Considerations in Irrigation Water Management: Facing Problems of Water Quality Control,
W73-13307 5G

Water Purifying Apparatus,
W73-13326 5D

Energy Implications of Several Environmental Quality Strategies,
W73-13421 5G

Upper Mississippi River Comprehensive Basin Study, Appendix H--Water Supply and Quality Control.
W73-13488 6B

WATER QUALITY MANAGEMENT

Data Acquisition Systems in Water Quality Management,
W73-13024 5G

WATER QUALITY STANDARDS

Data Acquisition Systems in Water Quality Management,
W73-13024 5G

Yellowstone National Park, Baseline Water Quality Survey Report.
W73-13133 5B

Pollution Abatement Programs in the Delaware River Estuary,
W73-13164 5G

A Report on Bacterial Pollution Affecting Shellfish Harvesting in Newport River, North Carolina.
W73-13298 5B

WATER REQUIREMENTS

Salt and Meal-Salt Help Distribute Cattle use on Semidesert Range,
W73-13317 3F

Water Requirements of the Petroleum Refining Industry,
W73-13561 3E

WATER RESOURCES

Water and Land Resources in Eden Valley, Wyoming,
W73-13044 3F

The Impact of Water Resources on the Location of Economic Activities,
W73-13149 6D

Some Possible Changes in Future Social Values and Priorities: Strategic Implications for Water Resources Planning,
W73-13153 6B

A Report on Corps of Engineers Research on the Management of Uncertainty in Water Resources Planning,
W73-13155 6B

On Multidisciplinary Research on the Application of Remote Sensing to Water Resources Problems.
W73-13299 5A

A Survey of the Water Resources of St. Thomas, Virgin Islands,
W73-13516 2A

An Overview of Water Management Problems,
W73-13551 5G

WATER RESOURCES DEVELOPMENT

International Symposium on Uncertainties in Hydrologic and Water Resource Systems, Vol. II.
W73-13134 4A

Strategic Uncertainty and the National Environmental Policy Act,
W73-13148 6B

WATER RESOURCES DEVELOPMENT

Subjective Planning: A Model for Water Resource Development,
W73-13150 6A

Problems of Water Resource Development in the Gulf Coast Estuarine Zone,
W73-13152 2L

Water Resources of Broward County, Florida,
W73-13209 2A

Upper Mississippi River Comprehensive Basin Study: Volume I, Main Report.
W73-13480 6B

Upper Mississippi River Comprehensive Basin Study, Appendix A--History of Investigation.
W73-13481 6B

Upper Mississippi River Comprehensive Basin Study, Appendix B--Aesthetic and Cultural Values.
W73-13482 6B

Upper Mississippi River Comprehensive Basin Study, Appendix C--Climatology and Meteorology.
W73-13483 6B

Upper Mississippi Comprehensive Basin Study, Appendix D--Surface Water Hydrology.
W73-13484 6B

Upper Mississippi Comprehensive Basin Study, Appendix E--Ground Water and Geology.
W73-13485 6B

Upper Mississippi River Comprehensive Basin Study, Appendix F--Mineral Resources.
W73-13486 6B

Upper Mississippi River Comprehensive Basin Study, Appendix G--Fluvial Sediment.
W73-13487 6B

Upper Mississippi River Comprehensive Basin Study, Appendix H--Water Supply and Quality Control.
W73-13488 6B

Upper Mississippi River Comprehensive Basin Study, Appendix I--Flood Control.
W73-13489 6B

Upper Mississippi River Comprehensive Basin Study, Appendix J--Navigation.
W73-13490 6B

Upper Mississippi River Comprehensive Basin Study, Appendix P--Economic Base Study and Projections.
W73-13496 6B

WATER RESOURCES INSTITUTE

Proceedings of Conference on Toward a Water Resources Research Plan for Minnesota.
W73-13303 6E

Annual Report. 1971-1972. New Jersey Water Resources Research Institute.
W73-13545 9D

WATER RESOURCES RESEARCH ACT

Changing Times for Water Research and Technology Transfer,
W73-13038 6B

WATER REUSE

Effect of Waste Water from the Astrakhan Cellulose-Pasteboard Plant on Soil Properties,
W73-13315 5D

Effect of Calcium Lignosulfonate on Properties of Concrete at Early Ages,
W73-13644 5D

Surface Adsorption: A Promising Approach for the Treatment of Tannery Effluents,
W73-13648 5D

WATER SHED MANAGEMENT

Engineering Hydrology,
W73-13016 3B

WATER SHORTAGE

The Sensitivity of Return Periods to Variations in Retention Levels for Different Definitions of Shortage,
W73-13162 4A

WATER SPORTS

Upper Mississippi River Comprehensive Basin Study, Appendix K--Recreation.
W73-13491 6B

WATER STORAGE (PLANTS)

Complex Characteristics of the Water-Holding Capacity of Plant Tissues, (In Russian),
W73-13576 3F

WATER STRUCTURE

Structure and Properties of Water and Their Significance for Biological Systems, (In Czech),
W73-13392 2I

WATER SUPPLY

Regional Water Resource Planning for Urban Needs: Part II (Appendices),
W73-13015 6A

Public and Industrial Water Supplies in Northern Mississippi,
W73-13042 6D

Modelling the Regulation of Lake Superior under Uncertainty of Future Water Supplies,
W73-13140 4A

Reservoir Management: Optimal Pricing and Rationing Policies under Uncertainty,
W73-13141 4A

Estimating Benefits to Improved Seasonal Water Supply Forecasts: A Case Study of Irrigation Benefits,
W73-13143 3F

The Sensitivity of Return Periods to Variations in Retention Levels for Different Definitions of Shortage,
W73-13162 4A

Upper Mississippi River Comprehensive Basin Study, Appendix H--Water Supply and Quality Control.
W73-13488 6B

Water Resources and Geology of Mount Rushmore National Memorial, South Dakota,
W73-13522 2F

Water Requirements of the Petroleum Refining Industry,
W73-13561 3E

WATER TABLE DEPTH

Effect of Temperatures and Water Table Depth on the Growth of Creeping Bentgrass Roots,
W73-13105 2I

WATER TEMPERATURE

Thermal Effects on Eggs, Larvae and Juveniles of Bluegill Sunfish,
W73-13020 5C

Wind-Swept Water Surface in Laboratory Cooled by Applying Heat,
W73-13434 2H

WATER TRANSMISSION

Water Transmission Properties of an Asphalt Barrier,
W73-13126 2G

WATER TREATMENT

Effects of a Polyelectrolyte as a Filter Aid,
W73-13089 5F

Optimum Economical Design for Municipal Diatomite Filter Plants,
W73-13090 5F

Process and System for Extracting Salts, Concentrated Brine, and/or Pure Water From Saline Water,
W73-13323 3A

The Present Status of Research on the Disinfection of Drinking Water in the USSR,
W73-13390 5F

Water Treatment for Heating and Process Steam Boilers,
W73-13462 5D

Magnetic Treatment of Water.
W73-13544 5G

Electrophoretic Evaluation and Process Control,
W73-13547 5D

Floating Aerator,
W73-13548 5G

Treatment of Acid Mine Waters,
W73-13549 5D

A Little Phenol Stirs up a Lot of Public Relations,
W73-13550 5G

WATER UTILIZATION

Terrestrial Plant Ecology.
W73-13340 2I

WATER WELLS

Water levels and Spring Discharges in Selected Wells and Springs in Nevada, 1966-69,
W73-13043 7C

Chemical Explosive Stimulation of Geothermal Wells,
W73-13229 8G

Design of Casings and Screens for Water Production and Injection Wells,
W73-13568 8A

WATER YIELD

Engineering Hydrology,
W73-13016 3B

Ground-Water Discharge from the Edwards and Associated Limestones, San Antonio Area, Texas, 1972.
W73-13515 2F

Map Showing Ranges in Probable Maximum Well Yield from Water-Bearing Rocks in San Francisco Bay Region, California,
W73-13519 7C

WATERFOWL

Reactions of Canada Geese to Reservoir Impoundment on the Snake River in Washington,
W73-13082 2H

Use of Hanford Waste Ponds by Waterfowl and Other Birds,
W73-13404 5C

ATERFOWL HUNTING
A Comparison of Consumer's Surplus and Monopoly Revenue Estimates of Recreational Value for Two Utah Waterfowl Marshes,
W73-13018 6B

ATERSHED MANAGEMENT
Determination of Optimal Multiple Uses of a Small Water Resource,
W73-13009 6A

ATERSHEDS (AGRICULTURAL)
Phosphate Movement From an Agricultural Watershed During Two Rainfall Periods,
W73-13115 5B

ATERSHEDS (BASINS)
Hydrologic Response of Massachusetts Watersheds,
W73-13034 2A

Developments in Applications of Remote Sensing to Hydrologic Modeling,
W73-13146 2E

AVES (WATER)
Reconnaissance Survey of Hog Island, Prince Edward Island,
W73-13205 2J

A Note on Wind and Wave Conditions in the Southern Gulf of St. Lawrence,
W73-13207 2L

Near-Shore Ripples: Some Hydraulic Relationships,
W73-13530 8B

EATHERING
The Significance of the Solution of Feldspar in Porosity Development,
W73-13537 2J

ELL CLEANING
Ground Water Development and Management in the Owens Valley,
W73-13569 4B

ELL SCREENS
Design of Casings and Screens for Water Production and Injection Wells,
W73-13568 8B

ELL STIMULATION
Stimulation of Geothermal Systems,
W73-13225 8C

Explosive Stimulation of Hydrothermal Reservoirs,
W73-13227 8H

Induction and Growth of Fractures in Hot Rock,
W73-13228 8H

Chemical Explosive Stimulation of Geothermal Wells,
W73-13229 8H

Environmental Aspects of Nuclear Stimulation,
W73-13230 8H

Corrosion and Scaling in Nuclear-Stimulated Geothermal Power Plants,
W73-13231 8H

WELL WATER
Analysis of Some Inorganic Constituents in Well Waters and Their Sediments,
W73-13151 4B

WELLS
Environmental Aspects of Nuclear Stimulation,
W73-13230 8H

Corrosion and Scaling in Nuclear-Stimulated Geothermal Power Plants,
W73-13231 8H

WEST VIRGINIA
A Mathematical Model for Preliminary Evaluations of Candidate Reservoir Systems,
W73-13529 8D

WETLANDS
Economic Criteria for Decisions on Preservation and Use of Inland Wetlands in Massachusetts,
W73-13518 6B

WHEAT (AOTEA)
Water Stress in 'Turoa' Red Clover Under 'Aotea' Wheat,
W73-13527 3F

WHEAT EARS
Effect of Awns and Drought on the Supply of Photosynthate and Its Distribution Within Wheat Ears,
W73-13595 3F

WHEAT (HOP GROWING)
Copper Accumulation in Soils Used for Hop Growing in Bavaria, (In German),
W73-13395 5B

WHEAT YIELD
Economic Significance of Dry-Land Farming in the Arid Northern Negev of Israel,
W73-13121 3F

Description and Use of an Underwater Television System on the Atlantic Continental Shelf,
W73-13559 7B

Effect on Wheat Yield and Nitrogen Uptake from Manures Made from Spent-Slurry,
W73-13601 3F

WHEATGRASS
Productivity of Tall Wheatgrass and Great Basin Wildrye Under Irrigation on a Greasewood-Rabbitbrush Range Site,
W73-13314 3B

WHEATGRASSES
Methods for Seeding Three Perennial Wheatgrasses on Cheatgrass Ranges in Southern Idaho,
W73-13319 4A

WHITE PERCH
Utilization of the Crayfish Orconectes Limosus as Forage by White Perch (Morone Americana) in a Maine Lake,
W73-13106 2H

WILDLIFE
Determination of Optimal Multiple Uses of a Small Water Resource,
W73-13009 6A

Upper Mississippi River Comprehensive Basin Study, Appendix L--Fish and Wildlife Resources.
W73-13492 6B

WILLAMETTE RIVER BASIN (ORE)
Decision Making in Water Resource Allocation,
W73-13301 6B

WILMINGTON (DEL)
The Effect of Urbanization on Runoff Quantity,
W73-13032 4C

WIND CURRENTS
Use of Computers to Compute Unsteady Wind Currents in Bodies of Water as Illustrated by Lake Baykal (Primeneniye EVM dlya rascheta neustanovivshikhsya vetrovykh techeniy v vodoyemakh (na primere oz. Baykal)),
W73-13053 2H

WINDS
Use of Computers to Compute Unsteady Wind Currents in Bodies of Water as Illustrated by Lake Baykal (Primeneniye EVM dlya rascheta neustanovivshikhsya vetrovykh techeniy v vodoyemakh (na primere oz. Baykal)),
W73-13053 2H

On the Wind-Driven Circulation of a Stratified Ocean,
W73-13429 5B

Wind-Swept Water Surface in Laboratory Cooled by Applying Heat,
W73-13434 2H

WINTER
Change in Feeding and Body Condition of Brown Bullheads Overwintering in the Heated Effluent of a Power Plant,
W73-13430 5C

WISCONSIN
Fossil Pigments in the Surface Sediments of a Meromictic Lake,
W73-13099 5B

Distribution and Background Levels of Mercury in Sediment Cores From Selected Wisconsin Lakes,
W73-13264 5B

WITHDRAWAL
Subsidence of the Venice Area During the Past 40,000 Yr,
W73-13526 2F

WOODLAND STREAM
Ecology of Two Related Species of Caddis Fly Larvae in the Organic Substrates of a Woodland Stream,
W73-13286 5B

WOODY PLANTS
Physiology of Daily Transpiration Rhythm in Woody Plants,
W73-13095 2D

WYOMING
Water and Land Resources in Eden Valley, Wyoming,
W73-13044 3F

Streamflow Data Usage in Wyoming,
W73-13306 7C

X-RAY EMISSION SPECTROSCOPY
The Determination of All Detectable Elements in the Aquatic Plants of Linsley Pond and Cedar Lake (North Bradford, Connecticut) By X-Ray Emission and Optical Emission Spectroscopy,
W73-13261 5A

X-RAY FLUORESCENCE
Hydrocarbons from Sea Water,
W73-13257 5A

XEROTHERMIC LICHENS
Data on the Water Balance of Some Xerothermic Terrestrial Lichens,
W73-13397 2I

YEASTS
Uptake of Mercury by Yeast Cells,
W73-13030 5D

The Significance of Hydrocarbon Assimilation in Yeast Identification,
W73-13512 5A

YELLOW PERCH
The Effects of Methoxychlor on Fishes: I. Acute Toxicity and Breakdown Studies,
W73-13122 5C

YELLOWSTONE NATIONAL PARK
Yellowstone National Park, Baseline Water Quality Survey Report.
W73-13133 5B

ZETA POTENTIAL
Electrophoretic Evaluation and Process Control,
W73-13547 5F

ZINC
Separation of Manganese, Iron, Cobalt, Nickel, Copper, Zinc and Cadmium by Reversed-Phase Chromatography Using Tri-N-Octylamine as the Stationary Phase and Applying a Gradient Elution Technique, (Extraktionschromatographische Trennung Von Mangan, Eisen, Kobalt, Nickel, Kupfer, Zink Und Cadmium Unter Verwendung Von Tri-n-Octylamin Als Stationare Phase Und Gradientelution),
W73-13234 5A

Iron Spectral Interference in the Determination of Zinc by Atomic Absorption Spectrometry,
W73-13277 5A

ZONE OF DIFFUSION
Hydraulic Sand-Model Study of the Cyclic Flow of Salt Water in a Coastal Aquifer,
W73-13558 2L

ZOOPLANKTON
A Comparison of the Zooplankton Communities in Seven Mountain Lakes Near Lillehammer, Norway (1896 and 1971),
W73-13117 5C

Taxonomic Guides to Arctic Zooplankton (V): Pelagic Polychaetes of the Central Arctic Basin,
W73-13233 5A

Nitrogen Metabolism in the Sea.
W73-13292 5B

Taxonomic Guides to Arctic Zooplankton (VI): Appendicularians of the Central Arctic, Mysids of the Arctic Ocean and Confluent Seas, Field Guide to Arctic Zooplanktonic Crustaceans Ostracods of the Central Arctic,
W73-13300 5A

ZOOPLANKTON GRAZING
The Seasonal Cycle of Pheopigments in Lake Ontario with Particular Emphasis on the Role of Zooplankton Grazing,
W73-13572 5C

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association.
- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.

SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
R 2 5 1974
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 6, NUMBER 22
NOVEMBER 15, 1973

W73-13651 -- W73-14200

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 6, NUMBER 22
NOVEMBER 15, 1973

W73-13651 – W73-14200

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

s tenth volume in the Studies and Reports in
drology series presents the proceedings of the
rnational Conference on the Practical and
ntific Results of the International Hydrologi-
Decade and on International Cooperation in
rology, held at UNESCO Headquarters in
s from December 8-16, 1969, in pursuance of
lution 2.332 adopted by the Unesco General
ference at its fifteenth session. The aims of the
ference were to stimulate further active par-
ation in the decade by member states, and to
le member states to assess the progress of the
vities conducted within the framework of the
de and to consider the needs and possibilities
long-term program of action. The conference
with three main topics: (a) a review of the
accomplished during the first half of the
de; (b) the preparation of proposals for future
of the decade and for possible changes in
tion of the program; and (c) an exchange of
s on a long-term plan of action in the field of
ology. Six scientific papers discuss the most
rtant problems of the International Hydrolog-
Decade program. (See W73-13766 thru W73-
4) (Knapp-USGS)

The Working Group on the World Water Balance has initiated the following activities: compilation of a bibliography of pertinent references; estimation of long-term avearage amounts of water participating in the hydrological cycle and of water in the several realms where it accors; compilation of data on the transportation of dissolved and suspended solids in water; and study of variations of hydrological phenomena. Several member states have published national water-balance estimates, but many States do not have sufficient data to do so. For the world as a whole, more information is available about surface runoff than about any other phenomenon in the land phase of the water cycle. Even so, data are lacking or inadequate for about two-thirds of the land area for runoff and all other parameters. Among steps taken to accelerate acquisition of data and understanding is improved cooperation among international intergovernmental agencies in hydrological studies. WMO, FAO and IAEA have been especially productive. Even closer collaboration between hydrologists and meteorologists, however, is necessary. Under the stimulus of the IHD and the Coordinating Council, more and more countries are systematizing hydrological dataprograms and publication of data. Thereby, previously unavailable data are becoming available for regional analyses. Data that are still notoriously deficient, however, concern the discharge of suspended and dissolved solids by rivers into the seas. Much remains to be done also in the development and standardization of instruments and analytical methods for obtaining and processing data. (See also W73-13765) (Knapp-USGS)
W73-13766

INFLUENCE OF MAN ON THE HYDROLOGICAL CYCLE: GUIDELINES TO POLICIES FOR THE SAFE DEVELOPMENT OF LAND AND WATER RESOURCES.

In: Status and Trends of Research in Hydrology, 1965-74; Proc. of International Conference held at UNESCO Headquarters, December 8-16, 1969, Paris: United Nations Educational, Scientific and Cultural Organization, Paris, p 31-70, 1972. 2 fig, 101 ref.

Descriptors: *International Hydrological Decade, *Environmental effects, *Hydrologic cycle, *Land use, Water pollution, Erosion, Sedimentation, Urbanization, Political aspects, Ecology, Water resources development, Legislation, Regulation, Legal aspects, Social aspects.
Identifiers: *World water balance.

The sciences and technologies involved in the measurement of hydrological results of changes in land use are reviewed. Evidence from large-scale catchment studies of experimental changes in land use, as distinct from tests on small plots, is still scarce and is reviewed in some detail. Records of experience of the hydrological effects of major land use changes are scattered among many departments in each country. Positive land use policies are needed for forest lands, grasslands, arable land, irrigation and salinity, swamp drainage, urbanization, water pollution, landslides, road construction, and the location of danger areas in very large catchments. In technically advanced countries the pressures of economic forces are rewarding the good and penalizing the bad land use policies so that progressive improvement is occurring. Water pollution remains the most serious problem and this will be overcome only at high cost with support of strong public opinion to secure enactment and enforcement of legislation. In developing countries rapid increases of population are resulting in unplanned proliferation of subsistence agriculture, without the means or the discipline to protect natural resources. Provision of fertilizers, of improved seeds, and of financial credit to permit their use is recommended as the most direct means to combat soil erosion and to protect land and water resources. Discipline in the use of water resources for irrigation and their protection from pollution is advised as a high priority. Education alone is ineffective since the application of technical knowledge too often fails through political inertia. (See also W73-13765) (Knapp-USGS)
W73-13767

SOIL EROSION AND TRANSPORT OF SOLIDS BY STREAMS, (EROSION DU SOL ET TRANSPORTS SOLIDES DES COURS D'EAU).

In: Status and Trends of Research in Hydrology, 1965-74; Proc. of International Conference held at UNESCO Headquarters, December 8-16, 1969, Paris: United Nations Educational, Scientific and Cultural Organization, Paris, p 71-83, 1972. 2 tab, 6 ref.

Descriptors: *Sedimentology, *Sedimentation, *Sediment transport, *International Hydrological Decade, *Erosion, Research and development, Soil erosion, Silting, Bed load, Suspended load.
Identifiers: *World water balance.

Research in erosion by water, sedimentation in deltas and dams the mechanisms of transport (especially of bed-loads), the relations between fluid and solid discharge, radioisotopes, and other methodological studies are reviewed. To implement the IHD project on estimation of global sediment transfer to the ocean and erosion in the various ecological zones of the world, systematic measuring work will have to be continued and stepped up. It will be necessary to arrange to collate the data submitted by the countries during the decade with a view to making the final estimates. Recourse would also have to be made to extrapolation in order to apply known values to regions where no measurements have been made. In order to form a complete picture of how much sediment is being transferred to the ocean, it is necessary to carry out measurements of dissolved matter. The Continental Erosion Commission of the IASH could offer a convenient venu for specialists and provide the framework for final collation of data. (See also W73-13765) (Knapp-USGS)
W73-13768

STATUS AND TRENDS IN HYDROLOGICAL FORECASTS: PART A, FORECASTING OF RUN-OFF, RIVER AND LAKE LEVEL, ICE CONDITIONS AND SURFACE-WATER TEMPERATURE,
P. I. Miljukov.
In: Status and Trends of Research in Hydrology, 1965-74; Proc. of International Conference held at UNESCO Headquarters, December 8-16, 1969, Paris: United Nations Educational, Scientific and Cultural Organization, Paris, p 85-100, 1972. 55 ref.

Descriptors: *Runoff forecasting, *Streamflow forecasting, *Water temperature, *International Hydrological Decade, Data collections, Data processing, Stream gages, Snowmelt, Water yield, Water balance.
Identifiers: *World water balance.

Hydrological forecasting constitutes one of the essential aspects of applied hydrology and one which is of interest to many sectors of a country's economy. The past activities of the World Meteorological Organization (WMO), in the field of hydrological forecasting are summarized. The types of hydrological forecasting and of the main fundamental methods employed are reviewed. Examples are given of methods for short-term forecasting of levels and discharges which are based on the evaluation of the volume of water in a river or on

calculation of the movement of the water in a river bed. Also described are methods of long-term forecasting of volumes of flow following the melting of ice and snow. Despite the introduction of electronic calculating machines which have all but eliminated the problems of complex calculations in hydrological forecasting, the question of observation still remains to be solved, both from a technological and a theoretical viewpoint. Improved techniques, especially the installation of automated systems for the acquisition and processing of hydrometeorological data, should increase the efficiency of hydrological forecasting; international cooperation is essential if progress is to be made in this field. (See also W73-13765) (Knapp-USGS)
W73-13769

STATUS AND TRENDS IN HYDROLOGICAL FORECASTS: PART B, FORECASTING OF GROUND WATER, SOIL MOISTURE AND SEDIMENTATION.

In: Status and Trends of Research in Hydrology, 1965-74; Proc. of International Conference held at UNESCO Headquarters, December 8-16, 1969, Paris: United Nations Educational, Scientific and Cultural Organization, Paris, p 101-112, 1972. 21 ref.

Descriptors: *Groundwater, *Soil moisture, *Sedimentation, *International Hydrological Decade, Research and development, Transmissivity, Diffusivity, Specific yield, Storage coefficient, Hydrogeology.
Identifiers: *World water balance.

Groundwater forecasting is concerned with changes that may be brought about in hydrogeological systems by natural or external causes. Difficulties are encountered in evaluating precisely aquifer constants and boundary conditions. Even though there now exist methods for computing certain basic parameters (such as coefficients of transmissibility, storage and specific yields), no methods have yet been developed for the computation of coefficients of diffusion, absorption or crossflow. Further theoretical and practical research is needed. Fundamental research is very important in the field as well as in the laboratory. (See also W73-13765) (Knapp-USGS)
W73-13770

NETWORK PLANNING AND DESIGN: PART A, REVIEW OF SCIENTIFIC APPROACHES AND PROBLEMS IN HYDROLOGICAL NETWORK DESIGN,
J. C. Rodda.
In: Status and Trends of Research in Hydrology, 1965-74; Proc. of International Conference held at UNESCO Headquarters, December 8-16, 1969, Paris. United Nations Educational, Scientific and Cultural Organization, Paris, p 113-125, 1972. 1 fig, 1 tab, 60 ref.

Descriptors: *Data collections, *Network design, *Hydrologic data, Data processing, International Hydrological Decade, Gaging stations, Telemetry, Remote sensing, Variability, Systems analysis.
Identifiers: *World water balance, Information theory.

Concepts of network design are reviewed stressing the present state of the science, recent developments and trends. Many present networks are inadequate partly as a result of lack of adequate criteria for design of networks. A network collects ordered data to achieve a given objective. Methods of analysis and synthesis of data could help define objectives for a network. For instance, mapping or regionalization could determine accuracy criteria for extrapolation as well as those criteria to be used in network design. More recent developments use information theory concepts for network design, and use the primary-secondary station concept, in which the primary stations sample time variability and the secondary stations sample spatial variability. The balance between the two types of stations is determined by the relative information content and eventually the value of each type of data should be related in economic terms, in order that the various kinds of hydrological networks could be used to their full extent on a joint basis. (See also W73-13765) (Knapp-USGS)
W73-13771

NETWORK PLANNING AND DESIGN: PART B, NETWORK DESIGN FOR OBSERVATION OF WATER QUALITY, SEDIMENT TRANSPORT, GROUND WATER, AND SOIL MOISTURE.

In: Status and Trends of Research in Hydrology, 1965-74; Proc. of International Conference held at UNESCO Headquarters, December 8-16, 1969, Paris: United Nations Educational, Scientific and Cultural Organization, Paris, p 126-130, 1972.

Descriptors: *Data collections, *Network design, *Surveys, *Hydrologic data, Data processing, International Hydrological Decade, Gaging stations, Telemetry, Remote sensing, Variability, Systems analysis.
Identifiers: *World water balance, Information theory.

A survey was made of network design for water quality, sediment transport, groundwater and soil moisture in the countries participating in the IHD. Some networks are very rudimentary and are intended to serve as a basis for further expansion, while others only function locally but are very close-knit so as to deal with some specific practical problem. As regards their purpose each of the networks falls into one of three categories: networks for the evaluation of resources for planning purposes; networks for studying the relationship between the parameter studied and a hydrological characteristic already observed in a conventional network of adequate density (for example, the relationship between the level of groundwater reservoirs and surface waters); and network providing basic data for further studies of the problem. The number of networks dealing with all four types of data (water quality, sediment transport, groundwater, and soil moisture) and organized on a national basis is small and progress in their organization therefore depends primarily on action at the national level. (See also W73-13765) (Knapp-USGS)
W73-13772

THE PROBLEM OF FLOODS AND THEIR COMPUTATION,
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
A. A. Sokolov, and D. L. Sokolovskii.
In: Status and Trends of Research in Hydrology, 1965-74; Proc. of International Conference held at UNESCO Headquarters, December 8-16, 1969, Paris: United Nations Educational, Scientific and Cultural Organization, Paris, p 131-139, 1972. 24 ref.

Descriptors: *Flood forecasting, *International Hydrological Decade, Floods, Statistical methods, Probability, Data collections, Flood frequency, Flood recurrence interval.
Identifiers: *World water balance.

The methods presently in use for the computation and forecasting of floods are reviewed. These methods are based on statistical study and on analysis of the genesis of past floods and can be divided into two categories: empirical or semi-empirical methods which calculate the maximum discharge of a flood by using data such as the surface area of the basin and the intensity of the precipitation; and methods based on the genesis of the flood (isochrones, unit hydrographs, mathematical models) based on the study of the transformation of snowmelt and rainfall water into a flow hydrograph by the watershed. The lack of information on the computation of probable frequency of catastrophic floods means that methods of statistical forecasting based on the probability of exceptional rainfall are of interest. An international survey of methods of study and computation of floods in use in different regions and the establishment of a world catalogue of floods observed in different countries would be the first steps in the preparation of and international guide on the computation of floods. Descriptors: *Subsurface runoff, *Snowmelt, *Mathematical models, Base-flow, *Idaho, Saturated flow, Unsaturated flow, Unsteady flow, Small watersheds, Basalts, Risks, Computer models, Monte Carlo method, Model studies.
Identifiers: *Hydrologic response model, Deterministic flow equations, Stochastic parameter distributions, *Reynolds creek experimental watershed.

A mathematical model of subsurface flow is used to complement a field study of snowmelt runoff in a small upstream source area in the Reynolds Creek Experimental Watershed near Boise, Idaho. Field measurements from an instrumented cross-section show that the mechanism of streamflow generation is subsurface delivery of melt-water over limited distances through shallow, high-permeability, low-porosity formations of altered and fractured basalt. The mathematical model provides a two-dimenstional, transient, saturated-unsaturated analysis of the subsurface flow at the field site. It proved to be a valuable aid to a unified interpretation of the field measurements. For mathematical models that consist of boundary-value problems with boundary conditions that are temporally and spatially dependent, the boundary-condition sensitivity can thwart the rational calibration-validation procedure. This, together with the more serious limitations of data availability and computer capacity, precludes the imminent use of fully-deterministic hydrologic response models on a regional scale. A brief summary of the project is reported. (See also W73-03257).

DETERMINATION OF PEAK DISCHARGE OF A MEDIUM-SIZED WATERSHED FOR THE REQUIRED FREQUENCY BY SIMPLIFIED RATIONAL METHOD,
ant Coll of Tech., Pantnagar (India).
). Mukherjee.
ndian Geohydrology (Calcutta), Vol 8, No 2, p 59-0, December 1972. 4 fig, 3 ref.

Descriptors: *Rational formula, *Peak discharge, Rainfall-runoff relationships, Time of concentration, Runoff forecasting.

A simplified rational method was evolved so that he peak discharge of a specific frequency can be omputed in a short time from meteorological and oil data. Watershed area is generally measured rom contour maps or air photos. Main channel lope should represent the average slope, excluding the upper, intermediate and lower relatively eep reaches. Time permitting, the slope should e calculated from contour maps. Shape factor is a easure of the elongation of the watershed. The egree of elongation of the watershed has an imortant effect on the time of concentration. (K-app-USGS)

SOME ASPECTS OF HYDROMETEOROLOGY,
ndia Meteorological Dept., New Delhi.
. Koteswaram.
ndian Geohydrology (Calcutta), Vol 8, No 1, p 10-2, June 1972.

Descriptors: *Data collections, *Hydrologic data, Meteorological data, *Flood forecasting, Warning systems, Streamflow forecasting, Snowmelt.
Identifiers: *India.

India ranks high among the countries of the world in the field of hydrometeorology. The importance of systematic measurements of rainfall has been recognized in India for more than 100 years. There are about 4500 ordinary rain-gage stations distributed over the country. In addition, there are about 350 recording rain gages which give a continuous record of rainfall and provide valuable information about short-duration rainfall values. Snow gages have been set up at a number of stations located in the Himalayas. The hourly, daily and monthly data of these stations have been put on punched cards. They are thus available for being fed into modern electronic computers for the calculation of any required rainfall statistics. Evaporation data using the standard Class 'A' pan evaporimeters are being recorded at a network of about 120 stations in India and these data are available for nearly a decade. The Regional Forecasting Offices of the India Meteorological Department at Bombay, Calcutta, Madras, Nagpur and New Delhi are issuing weather and flood forecasts and heavy rainfall warnings pertaining to areas under their jurisdiction. Flood forecast centers provide information about river levels and forecast of river levels during the flood season at desired points along the main rivers and their tributaries and issue warnings of high water levels to add executive authorities and to general public. The India Meteorological Department is cooperating in this venture by providing necessary weather forecasts through its Regional Meteorological Centers. (Knapp-USGS)

MATHEMATICAL MODELING OF STREAMFLOW (MATEMATICHESKOYE MODELIROVANIYE RECHNOGO STOKA),
L. S. Kuchment.
Gidrometeoizdat, Leningrad, 1972. 192 p.

Descriptors: *Streamflow, *Model studies, *Mathematical models, Computer models, Input-output analysis, Hydrographs, Discharge (Water), Runoff, Storm runoff, Overland flow, Snowmelt, Floods, Routing, Streamflow forecasting, Watershed (Basins), Rivers, Mathematics, Optimization, Fourier analysis, Laplaces equation.
Identifiers: USSR, Deterministic models, St. Venant equations.

Methodology of building mathematical models of runoff and use of these models in hydrologic forecasts and computations are discussed. Watershed and channel models are constructed on the basis of input and output observations, and special attention is paid to inverse problems and to determination of parameters in the model. Methods proposed for solution of these problems for individual models are based on the theory of incorrectly formulated problems and optimization techniques, and examples are given of the practical application of classical methods of mathematical physics to streamflow modeling. ESTIMATE OF THE CONTENT OF SPRAY DROPS IN THE NEAR-WATER LAYER OF THE ATMOSPHERE,
L. Yu. Preobrazhenskii.
Fluid Mechanics--Soviet Research, Vol 2, No 2, p 95-100, March-April 1973. 3 fig, 2 ref.

Descriptors: *Drops (Fluids), *Particle size, *Air-water interfaces, *Atmosphere, Air circulation, Winds, Storms, Waves (Water), Height, Estimating, Analytical techniques, Anemometers, Curves, Equations.
Identifiers: USSR.

Spectral composition and concentration of spray drops transported by air currents in lower layers of the atmosphere above the sea were determined during an expedition by the Main Geophysical Observatory to the North Atlantic in the fall of 1969. Research was carried out when winds were moderate (6-10 m/sec) and wave height was 1.5-2.5 m and when winds were strong (15-25 m/sec) and wave height was 4-6 m. Maximum concentrations were observed for drops having diameters ranging from 0.0005 cm to 0.0030 cm. In moderate winds, 1 cu m of air contains 100 to 1,000 particles and in strong winds, 1,000 to 10,000 particles. Spray-drop concentration decreases as particle size and distance from the surface increase. The largest particles observed at a height of 1.5 m have a diameter ranging from 0.0130 cm to 0.0150 cm. Under stormy conditions, maximum spray-drop sizes observed at a height of 2 m range from 0.0500 cm to 0.2000 cm, and their concentration is low (1 cu m of air contains 1 to 20 large drops). Particles having diameters smaller than 0.0200 cm reach a level of 4 m and those having a diameter of 0.0090 cm reach a level of 7 m. Distribution of spray-drop concentrations by size and height, and vertical distribution of water content in lower layers of the atmosphere are graphed for cases of moderate and strong winds. ESTIMATION OF AVERAGE DAILY RAINFALL FROM SATELLITE CLOUD PHOTOGRAPHS,
National Environmental Satellite Service, Washington, D.C.
W. A. Follansbee.
Available from NTIS, Springfield, Va. 22151 as COM-73-10539 Price $3.00 printed copy; $1.45 microfiche. Technical Memorandum NESS 44, January 1973. 39 p, 14 fig, 15 15 tab, 17 ref.

Descriptors: *Weather forecasting, *Rainfall, *Aerial photography, *Clouds, Methodology, Satellites (Artificial), Climatology, Mathematical studies, Correlation analysis.

In the past 5 years a number of investigators have made progress in the development of techniques for estimating rainfall from meteorological satellite imagery. A simple technique is described for estimating the average daily rainfall over subsynoptic scale areas in the tropics and subtropics. The procedure is to determine the percentage of a given area covered by each of three rain-producing cloud types (cumulonimbus, nimbostratus, and cumulus congestus); these percentages are multiplied by empirically established coefficients to obtain the rainfall contribution to be expected from each cloud type. The method was tested for Zambia, Thailand, California, Florida, and the south central United States; results were encouraging. Weighting factors to adapt the technique to the heaviest rainfall stations of India were derived. (Woodard-USGS)

RAINFALL INTENSITY INSTRUMENTS AND MEASUREMENTS,
Hawaii Univ., Honolulu. Water Resources Research Center.
C. M. Fullerton, and D. J. Raymond.
Available from the National Technical Information Service as PB-223 010, $3.00 in paper copy, $1.45 in microfiche. Technical Report No 67, June 1973. 32 p, 9 fig, 1 tab, 6 ref. OWRR B-024-HI (2) 14-31-0001-3575.

Descriptors: *Instrumentation, Networks, *Precipitation (Atmospheric), Rainfall, *Rainfall intensity, *Rain gages, *Hawaii, Measurements.

Two instruments have been used to measure the rate of rainfall from tropical clouds over the windward coast of the Island of Hawaii. The Workman intensity gauge employes strain gauges to sense the deflection in a movable trough and hence the flow of water down the trough. The Raymond-Wilson gauge, a new instrument developed during this program, measures the electrical resistance of flowing water to determine the rainfall rate. These instruments were deployed in a small scale array

of eight gauges to measure space and time variations in high intensity rainfall as showers move across the network. Comparative measurements were made with a standard weighing rain gauge, a tipping bucket rain gauge and the Jardi rate of rainfall gauge. Both the Workman gauge and the Raymond-Wilson gauge are clearly superior to the other instruments, because of their rapid response time and their capacity to measure high intensity showers continuously and automatically. The Raymond-Wilson gauge contains no moving parts and is operationally more suitable than the Workman gauge for deployment in a network of gauges. A sensor which measures the rate of change of atmospheric pressure has also been developed and is being used in the research program. An example of rainfall intensity measured during a 43-day period in October and November, 1972, is presented, along with a preliminary estimate of the in-cloud liquid water content of shallow Hawaiian clouds.

USE OF THE ELECTRON MICROSCOPE HYDRATION CHAMBER TO STUDY SMALL WATER DROPS,
Roswell Park Memorial Inst., Buffalo, N.Y. Electron Optics Lab.
W. Chang.
In: Proceedings 31st Annual Meeting Electron Microscopy Society of America, New Orleans, La., Aug 14-17, 1973. Edited by J. Arceneaux. Claitor's Publishing Division, Baton Rouge, La. p 16-17. 1973. 4 fig, 3 ref.

Descriptors: *Water properties, *Drops (Fluids), *Laboratory equipment, *Electron microscopy, Dropwide condensation, Evaporation, Physical properties, Water structure, Analytical techniques, Cloud physics, Clouds, Air temperature, Saturation, Super-saturation, Temperature, Humidity, Moisture, Thin films, Crystallography.

A modified hydration chamber for electron microscopes has been developed which can be used as an observable micro-atmosphere to study droplet formation, evaporation, coalescence into rain drops, freezing into hail, and related phenomena as functions of supersaturation and temperature. In the specific study reported, which illustrates the utility of the technique, droplet formation and growth on polystyrene-modified carbon film substrates were recorded photographically or on video tape. The observed mode radius (radius corresponding to the maximum number of droplets) was 0.16 micron, which is one order of magnitude less than that observed in clouds. Densitometric contrast measurements suggested that water does not possess strong scattering properties and hence would not hinder the imaging of wet objects in the electron microscope. They also suggested that the structure of water is not crystalline but mainly amorphous. Electron diffraction of thin water layers on different substrates will be used to shed further light. AN EMPIRICAL METHOD OF ESTIMATING DAILY AVERAGE BASINWIDE SNOWMELT,
Geological Survey, Menlo Park, Calif.
S. E. Rantz.
Available from NTIS, Springfield, Va., 22151 as PB-222 066 Price $3.50 printed copy; $1.45 microfiche. Water-Resources Investigations 14-73, June 1973. 27 p, 5 fig, 4 tab, 4 ref.

Descriptors: *Snowmelt, *Water yield, *Snow surveys, *Routing, Runoff forecasting, Water measurement, Streamflow forecasting, California.

The traditional but relatively unreliable degree-day method of computing daily snowmelt was modified by the addition of a daily index of the areal extent of the snowpack. The index used is actually a computed index of daily water equivalent of the pack. Because a fairly close relation often exists between water equivalent and areal extent of the snowpack at the start of the melt season, a relation also often exists during the melt season between the water-equivalent index and the snowpack area. The proposed method can be readily modified to make use of any available data from a pressure-pillow snow gage in the basin. Once obtained, the daily basinwide snowmelt values are used as input to a hydrologic routing model to compute daily values of snowmelt runoff (Knapp-USGS)

e physical and mathematical aspects of simul-
eous turbulent heat and water vapor exchange
ween a large open water body and the sur-
nding atmosphere were studied. Thus analyti-
and numerical solutions were developed for
ious conditions of fetch, surface roughness, at-
spheric stability, etc., that are likely to be of
sical importance. One of the main findings was
t in spite of some theoretical limitations the
ni-empirical turbulent diffusion model provides
nethod for the prediction of heat and water
or transfer, that should be useful for engineer-
calculations. Although the interaction between
mentum, sensible heat and water vapor is con-
erable, for evaporation or cooling calculation
poses it is probably permissible to uncouple
r transfer mechanisms provided the water sur-
e temperature is known and the averaging
iod under consideration is about a week. In ad-
on the validity of the semi-empirical assump-
n in the near-water surface layer was analyzed
determining the anisotropy of the eddy dif-
ivity, the effects of radiative transfer and of
er wave action on the eddy diffusivity. Finally,
ractical method was developed to determine
potranspiration from the surrounding land sur-
e based on the geostrophic drag concept. (EPA)

ic Meteorol. Vol 10, No 4/5, p 331-348, 1972. Il-

ntifiers: *Beans, *Canada (Ontario), *Evapora-
, Heat flux, Humidity, Radiation, Soils, Sur-
, Temperature, Wind speed, Transpiration.

poration from a row crop of beans in southern
ario, Canada, was examined within the com-
tion model framework using
rometeorological measurements of tempera-
, humidity, wind speed, net radiation and soil
flux collected during 10 days in 1970. Actual
poration values were higher than anticipated
the 30-40% vegetation ground cover but in
ping with the high ratio (80-95%) of transpiring
ace to ground plan area. Equilibrium evapora-
compared closely (to within 10%) with actual
poration on 6 days when the atmosphere was
humid and the ground was moderately dry.
Poorer agreement was obtained on the other days which were cooler and less humid. Wind profile and silhouette analyses showed that the bean crop was aerodynamically smoother than the crop height would suggest. Values of surface resistance were calculated from actual and potential evaporation, air temperature and aerodynamic resistance. These showed a response to changes in soil moisture and were related to the ratio of actual evaporation to available energy. Potential evaporation was significantly larger than actual evaporation and close to the net radiation.--Copyright 1973, Biological Abstracts, Inc.

ECO-PHYSIOLOGICAL INVESTIGATIONS ON WILD AND CULTIVATED PLANTS IN THE NEGEV DESERT: II. THE INFLUENCE OF CLIMATIC FACTORS ON CARBON DIOXIDE EXCHANGE AND TRANSPIRATION AT THE END OF THE DRY PERIOD,
Hebrew Univ., Jerusalem (Israel). Avdat Research Farm.
E. D. Schulze, O. L. Lange, and W. Koch.
Oecologia (Berlin), Vol 8, No 4, p 334-355, 1972, Illus.
Identifiers: Artemisia-herba-alba-D, *Carbon dioxide exchange, Citrullus-colocynthus-D, Climatic conditions, Datura-metel-D, Deserts, Hammada-scoparia-D, Light, *Negev Desert, Noaea-mucronata-D, Plants, Prunus-armeniaca-D, Reaumuria-negevensis-D, Salsola-inermis-D, Stomata, Temperature, *Transpiration, Vitus-vinifera-D, Wild, Zygophyllum-dumosum-D.

Species studied included: dominant species on the natural vegetation (Artemisia herba-alba, Hammada scoparia, Noaea mucronata, Reaumuria negevensis, Salsola inermis, Zygophyllum dumosum), cultivated plants receiving rainfall and run-off water during the winter season in the run-off farm Avdat (Prunus armeniaca, Vitis vinifera), and irrigated cultivated plants receiving additional water during the summer season (Citrullus colocynthis, Datura metel). Light saturation of net photosynthesis was reached at 60-90 klx conforming to the high solar radiation intensities of the desert. Maximum rates of CO2 uptake per unit of dry weight for the irrigated mesomorphic plants was 10 times that of the wild plants. In comparison to the other species, maximal rates of CO2 uptake for wild plants were higher when calculated on a leaf area basis than when represented on a dry weight basis. Maximum rates of net photosynthesis per unit chlorophyll content for some of the wild plants (Salsola and Noaea) were comparable to those of the cultivated Vitis and irrigated Citrullus and Datura. Hammada exhibited even higher rates than Prunus. Maximum rates of net photosynthesis of Hammada were measured when the temperature of the photosynthetic organs was 37 deg C; at 49 deg C photosynthesis was only reduced by 50%. Leaf temperature affects plant gas exchange by influencing stomatal aperture. Diffusion resistance of leaves to water vapor was reduced at low temperatures and increased at high temperatures. Reduction of net photosynthesis and transpiration of desert plants at midday may, therefore, be the result of temperature-induced stomatal closure. The possible influence of peristomatal transpiration on stomatal aperture is also discussed. (See also W73-01072)--Copyright 1972, Biological Abstracts, Inc.

2E. Streamflow and Runoff

FLOODS OF DECEMBER 1971 IN WESTERN ARKANSAS,
Geological Survey, Little Rock, Ark.
R. C. Gilstrap.
Arkansas Geological Commission Water Resources Summary No 8, 1973. 26 p, 5 fig, 3 tab, 5 ref.

Descriptors: *Floods, *Flood data, *Flood damage, *Flood frequency, *Arkansas, Precipitation (Atmospheric), Streamflow, Flow rates, Gaging stations, Hydrologic data, Data collections, Rainfall-runoff relationships, Flood discharge, Streams.

Heavy rains of December 1971 in western Arkansas caused record-breaking floods on many streams. Heavy rains began on December 8 and continued to December 10. The heaviest rain fell from the afternoon of December 9 to the early morning of December 10. Maximum accumulated rainfall for the 40-hour period exceeded 13 inches at Vandervoort. Most notable of the floods was on Ouachita River near Mount Ida, where there is a continuous record since 1941. The peak stage of 38.62 feet was 6.44 feet higher than the previous known maximum, which occurred in 1960, and the corresponding discharge of 95,500 cubic feet per second (cfs) was 67% greater than the previous known maximum. Lake Ouachita near Hot Springs and Nimrod Lake near Nimrod had the maximum computed peak inflows of 160,000 cfs and 80,000 cfs, respectively, for periods of record. No lives were lost as a result of the floods, but property damage was about $2,780,000. (Woodard-USGS)

FLOODS IN NEW YORK--1971,
Geological Survey, Albany, N.Y.
F. L. Robison.
Open-file report, 1973. 33 p, 7 fig, 2 tab.

Descriptors: *Floods, *New York, Data collections, Rainfall-runoff relationships, Hurricanes, Storms, Snowmelt.

The most damaging floods in New York in 1971 were caused by Tropical Storm Doria. The center of this storm passed over the northern part of New York City about 5 a.m. on August 28 and continued over land in a northeasterly direction into western Connecticut. In addition to the damage from the floods of Tropical Storm Doria in the southeastern region, a large part of the other damage reported in 1971 was also in the same region. In every month except January and September, flooding occurred somewhere in the New York City area or the lower Hudson River valley. Staten Island was especially hard hit by several storms. February ice jams caused some flooding at Utica, Mohawk, Herkimer, and Ilion in the central and eastern regions, and at Silver Creek, Sunset Bay, and the Buffalo area in the western region. During the months of April through September, heavy, short-duration rains and thunderstorms caused various degrees of flooding at many sites in the State. (Knapp-USGS)

APPRAISAL OF THE WATER RESOURCES OF EASTERN PALM BEACH COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
L. F. Land, H. G. Rodis, and J. J. Schneider.
Geological Survey Open-file report 73006, 1972. 117 p, 40 fig, 5 tab, 21 ref.

Descriptors: *Water resources, *Groundwater resources, *Surface waters, *Florida, *Water quality, Chemical analysis, Water yield, Water wells, Aquifer characteristics, Pumping, Drawdown, Specific capacity, Groundwater recharge, Rainfall, Streamflow, Canals, Hydrologic data, Data collections, Water supply, Water utilization.

Identifiers: *Eastern Palm Beach County (Fla).

Rapid population growth in the eastern coastal areas of Palm Beach County, Florida, places increasing demands on the water resources of the area and locally has created critical problems. Groundwater from the shallow aquifer, a hydrologic unit comprised of the Biscayne, Pamlico and Anastasia Formations, underlies the entire area and is the principal source of water for most uses. The top of the Floridan aquifer, a limestone under high artesian pressure, underlies the area at depths ranging from 800 to 1,000 feet below land surface but the water is too salty for most uses. Specific capacities of municipal wells range from about 10 to more than 350 gallons per minute per foot of drawdown. Municipal pumping averaged about 75 million gallons per day during 1970. West Palm Beach is the only community which uses surface water for municipal supply. Total dissolved solids of the freshwater in the shallow aquifer system ranges from 200 to 300 mg/liter in the coastal ridge to more than 500 mg/liter in the western areas. In the surface water system, the water containing the least amount of dissolved solids, generally less than 200 mg/liter, occurs in Canal 18 and Canal M immediately downstream from the Loxahatchee Slough. (Woodard-USGS)

HYDROLOGIC RECONNAISSANCE OF STREAMS AND SPRINGS IN EASTERN BROOKS RANGE, ALASKA--JULY 1972,
Geological Survey, Anchorage, Alaska. Water Resources Div.
J. M. Childers, C. E. Sloan, and J. P. Meckel.
Basic-data report, 1973. 25 p, 20 fig, 1 tab, 6 ref.

Descriptors: *Flood forecasting, *Streamflow, *Flood peak, *Alaska, Mathematical studies, Regression analysis, Flow rates, Springs, Water quality, Water temperature, Aerial photography, Flood recurrence interval, Chemical analysis, Geology, Topography, Surveys.
Identifiers: *Eastern Brooks Range (Alaska).

Estimates of bankfull discharge and maximum evident flood peak discharge by slope-conveyance methods were made for selected streams in the eastern Brooks Range, Alaska, based on field observations. Flood discharges for 2-year and 50-year average recurrence intervals were estimated for the same sites using regression equations that relate flood discharge to basin physical and climatic characteristics. Discharge, temperature, and specific conductance of selected springs were measured during the reconnaissance and water samples were collected for chemical analysis. All but one of the springs discharged from limestone bedrock or associated colluvial and alluvial deposits. Water from the springs is of the calcium bicarbonate type and has low total dissolved solids. Discharge, at time of measurement, ranged from about 4 to 36 cfs and temperature ranged from about 3 to 9C. (Woodard-USGS)

RELATIONSHIP BETWEEN STREAM WATER TEMPERATURE AND AMBIANT AIR TEMPERATURE (RELATION ENTRE LA TEMPERATURE DE L'EAU D'UNE RIVIERE ET LA TEMPERATURE DE L'AIR AMBIANT),
National Inst. of Scientific Research, Quebec.
D. Cluis.
INRS-Eau Technical Report No 3, July 1972. 11 p, 1 tab.

Descriptors: *Water temperature, *Air temperature, Streams, *Mathematical models, Measurement, Heat budget, Climatology.

The water temperature of streams and rivers is required for various practical purposes and is frequently obtained by calculating the heat budget. This method is tedious and yields rather inaccurate values for water temperature. This paper presents an alternative approach, using inexpensive and simple measurements of air temperature. It is demonstrated that a useful separation can be made between the seasonal cyclic variations and the daily stochastic fluctuations of temperature. (INRS-Eau)

KINEMATICS OF WATER PARTICLE MOTION WITHIN THE SURF ZONE,
Naval Postgraduate School, Monterey, Calif.
R. Steer.
Available from NTIS, Springfield, Va. 22151 as AD-756 523; Price $3.00 printed copy; $1.45 microfiche. M Sc Thesis, September 1972. 56 p, 25 fig, 7 ref.

Descriptors: *Kinetics, *Ocean waves, *Surf, *Ocean currents, Measurement, Current meters, Methodology, Velocity, Density, Energy, Tides.
Identifiers: Breaking waves, Water particle motion.

The kinematics of the water particle motion within the surf zone and within breaking waves was studied. Simultaneous measurements of sea surface elevation and horizontal and vertical particle velocities at 39 and 69 cm elevations in the column of water of 130 cm total depth were made inside the surf zone. Also, the offshore sea surface elevation at this location was measured for purposes of comparison. The velocities were measured using electromagnetic flow meters, and the sea surface elevation was measured using pressure wave gages. Probability density functions, pdf, were determined for each record. The pdf's for the sea surface elevation and particle velocities inside the surf zone were highly skewed. Spectral computations show that the range of significant energy was between 0.05 and 0.6 hertz. The phase angle was compared to linear wave theory and shows a shifting of phase for the horizontal velocity with sea surface elevation from 0 deg at low frequency to 90 deg at higher frequencies. The energy-density spectra show that the horizontal component is approximately 95% of the total kinetic energy of the surf zone. In the range of significant energy, a coherence of about 0.9 was found for the sea surface elevation and particle velocities which indicates that the particle motion inside the sur zone is for the most part wave-induced (Woodard USGS)

Geological Survey of India, Calcutta.
A. Subramanian.
Indian Geohydrology (Calcutta), Vol 8, No 2, p 7 85, December 1972. 2 fig, 1 tab, 3 ref.

Descriptors: *Tides, *Tidal streams, *Water qua ty, *Saline water intrusion, Tidal effects, Salinit Tidal waters, Streamflow.
Identifiers: *India (Goa).

Tidal effects are felt deep inland in the rivers flo ing in the Union Territory of Goa. An attempt h been made to study the fluctuations in river stag on the river Zuari due to tides and their bearing the quality of the river water. The effects were st died at two stations. Significant improvement water quality was observed during low tides. Su improvement in the quality of water during l tides can be taken advantage of for cyclic develo ment of water resources from tidal rivers. (Knap USGS)

criptors: *Aquitards, *Hydrologic properties, akage, Groundwater recharge, Pump testing, ne water intrusion, Management, *California, oundwater movement.
ntifiers: Oxnard (Calif), Newark-Fremont lif).

s research was aimed at developing improved hods of evaluating the hydrologic properties of itards and investigating the effect of the move-nt of water through aquitards on regional undwater flow patterns and water quality. Field mping tests from an earlier investigation of a y aquifer system in the Oxnard area of Califor- provided data that were analyzed. It has been nd that a simple method of evaluating the draulic properties of the aquitard is to measure wdown in the aquitard, s', and compare it to drawdown, s, in the adjacent aquifer that is ng pumped. The ratio s'/s can be directly corre-d with the hydraulic properties of the aquitard. ther work has shown that the ratio method uld also be applicable in areas where there are ional changes in head resulting from water hdrawal at one or more points in a groundwater in. A second field test of the ratio method was rted in the Newark-Fremont area of California emplacing piezometers in an aquitard overlying aquifer where degradation of groundwater is coming severe through salt water intrusion. By end of this project, not enough data had been collected to enable a further evaluation of the ratio method, but an unexpected development during the emplacement of piezometers in the aquitard layers has revealed that unusually high concentrations of salt are present in the pore waters of those aquitard layers that are located beneath salt evaporation ponds in the area.

STRUCTURAL AND STRATIGRAPHIC FRAMEWORK, AND SPATIAL DISTRIBUTION OF PERMEABILITY OF THE ATLANTIC COASTAL PLAIN, NORTH CAROLINA TO NEW YORK,
Geological Survey, Washington, D.C.
P. M. Brown, J. A. Miller, and F. M. Swain.
Available from GPO, Washington, D C 20402, $50.00 including plates. Professional Paper 796, 1972. 79 p, 13 fig, 59 plate, 2 tab, 177 ref.

Descriptors: *Hydrogeology, *Stratigraphy, *Structural geology, *Atlantic Coastal Plain, Permeability, Sedimentology, Sedimentation, Maps, Mapping, Geologic mapping, Cross-sections, Subsurface mapping.

Adetailed subsurface mapping program was undertaken in the part of the Atlantic Coastal Plain which extends from the South Carolina and North Carolina border through Long Island, N.Y. Data obtained from more than 2,200 wells are analyzed. Seventeen chronostratigraphic units are mapped in the subsurface. They range in age from Jurassic (question) to post-Miocene. The purpose of the mapping program was to determine the external and internal geometry of mappable chronostratigraphic units and to derive and construct a permeability-distribution network for each unit based upon contrasts in the textures and compositions of its contained sediments. A structure map and a combined isopach, lithofacies, and permeability-distritution map for each of the chronostratigraphic units delineated in the subsurface are included. Also included is a map of the top of the basement surface. These maps, together with 36 stratigraphic cross sections, present a three-dimensional view of the regional subsurface hydrogeology. They provide focal points of reference for a discussion of regional tectonics, structure, stratigraphy, and permeability distribution. Taken together and in chronologic sequence, the maps constitute a detailed sedimentary model, the first such model to be constructed for the middle Atlantic Coastal Plain. The series of combined isopach, lithofacies, and permeability-distribution maps, together with the series of structure-contour maps, illustrate the distribution of intrinsic permeability. CALIBRATION OF DISTRIBUTED PARAMETER GROUNDWATER FLOW MODELS VIEWED AS A MULTIPLE-OBJECTIVE DECISION PROCESS UNDER UNCERTAINTY,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Dept. of Soil and Water.
S. P. Neuman.
Water Resources Research, Vol 9, No 4, p 1006-1021, August 1973. 11 fig, 35 ref.

Descriptors: *Groundwater resources, *Flow, *Management, *Decision making, *Linear programming, *Aquifers, Finite element analysis, Optimization, Anisotropy, Systems analysis, Mathematical models, *Risks.
Identifiers: Multiple objectives, Sensitivity analysis.

Due to the deterministic nature of most groundwater flow models, there has been a tendency to overlook the strong element of uncertainty that invariably enters into the problem of parameter identification. Because of this uncertainty, an approach based on the minimization of a single error functional generally does not lead to satisfactory results. A multiple-objective decision process is postulated, accounting for all the available information on the aquifer flow system, as well as the range of environmental conditions under which the system is expected to operate in the future. According to this new approach, a continuous or discrete set of alternative solutions to the identification problem is generated with the aid of mathematical programming techniques, and the decision maker is asked to apply his own value judgment in selecting a particular model structure. The method is illustrated by applying parametric linear programming to a finite element model of steady state flow in a locally anisotropic aquifer. The reliability of each parameter estimate is ascertained using postoptimal sensitivity analysis. (Bell-Cornell)

Idaho Univ., Moscow. Dept. of Geology.
R. W. Wallace.
Ph D Dissertation, November 1972. 166 p, 8 fig, 4 plate, 35 ref, 5 append. OWRR A-018-IDA (6).

Descriptors: *Hydrogeology, *Finite element analysis, *Groundwater movement, *Mathematical models, *Alluvial channels, *Idaho, Alluvium, Water balance.
Identifiers: *Camas Prairie (Idaho).

A finite-element, planar-flow model was applied to groundwater movement in an intermontane valley in Camas and Elmore Counties, Idaho. The valley sides and surrounding areas are composed mainly of igneous and volcanic rocks that are relatively impermeable. The basement rock beneath the valley floor is assumed to be of the same material as the sides. The groundwater system consists of a shallow water table aquifer, a clay unit and two artesian aquifers separated by relatively impermeable silty clay. A finite-element mesh is developed corresponding to a geologic section parallel to the valley axis. The program computes head, potential, flow velocities in 2 directions normal to each other, resultant flow velocity and resultant flow direction with respect to the coordinate system, for each element in the mesh. CHEMICAL AND SPECTROCHEMICAL ANALYSES OF SELECTED GROUND WATER IN COLORADO,
Geological Survey, Lakewood, Colo.
E. C. Mallory, Jr., and P. R. Barnett.
Open-file report, June 1973. 47 p, 1 fig, 11 tab, 7 ref.

Descriptors: *Water analysis, *Chemical analysis, *Spectrometers, *Groundwater, *Colorado, Sampling, Data collections, Analytical techniques, Correlation analysis, Inorganic compounds, Nutrients, Trace elements, Water temperature, Geochemistry, Chemical reactions.

Chemical and spectrographic analyses are presented for 44 saline and 48 fresh samples of groundwater from wells and springs in Colorado. Thirty-two of the samples were from thermal springs. The samples were collected during 1967-69, many from the same sources sampled in 1911 and and 1912 in order to compare analytical data. Samples were collected and analyzed by the U. S. Geological Survey employing both conventional wet analytical and emission spectrographic techniques. Emission spectrographic analyses yielded determinations of elements not reported in the early studies, and modern instruments and methods in general make possible more accurate and sensitive chemical analyses. Comparison of 1967-69 with 191112 measurements of water temperature for selected spring water and groundwater showed little difference. Dissolved solids of 1967-69 water samples appeared to be slightly lower than those reported of 1911-12 samples, but this difference may be largely due to different methods of analysis. Some water contained arsenic, cadmium, iron, manganese, sulfate, chloride, and fluoride in concentrations that equalled or exceeded standards adopted by the U. S. Public Health Service for drinking water. (Woodard-USGS)

Identifiers: *Eugene-Springfield area (Ore).

The cities of Eugene and Springfield (Oregon) and their outlying suburban and rural districts constitute an area of rapid population growth where progressively greater volumes of groundwater are being required for irrigation and industrial and public supplies. The area is also one of diverse geologic and hydrologic conditions. Storage capacity of the central lowland in the Eugene-Springfield area is estimated to be about 2.1 million acre-feet in the zone 10-150 feet below land surface. The quantity of groundwater available annually from this area is far greater than the 23,000 acre-feet pumped for all uses in 1968. Groundwater from the alluvial deposits of the valley plain is chemically suitable for irrigation and other uses, as is most of the water obtained from perched-water bodies i volcanic rocks. However, the mineral content of water from the older sedimentary rocks, particularly from deeper producing zones, is greater than the mineral content of water from the alluvial deposits. Locally, some of the water from the older rocks is too saline for most uses. Increased use of groundwater may result in certain problems pertaining to waste-disposal practices, local overdraft of aquifers, well interference, and well construction. (Woodard-USGS)

S. Mallick, and D. Niyogi.
Indian Geohydrology (Calcutta), Vol 8, No 2, p 86-98, December 1972. 7 fig, 10 ref.

Descriptors: *Hydrogeology, *Geomorphology, *Alluvial channels, Terraces (Geologic), Alluvium, Sands, Deltas, Exploration, Investigations, Aquifer characteristics.
Identifiers: *India (Bengal).

The Quaternary terrain around Burdwan, India shows two common and distinct types of landforms--deltaic plains and valley plains. On the basis of a detailed photogeomorphic map groundwater potential was predicted through geomorphpositions of buried channels, filled valley-cuts and substrata of formations are possible aquifers. Laterite uplands are generally low-potential zones. Terraces of the rivers are considered to be good-potential zones. A detailed photogeomorphic map is very helpful for locating the positions of the ancient buried channels within the terraces. (Knapp-USGS)

THE MODERN SCOPE OF HYDROGEOLOGY,
Research Council of Alberta, Edmonton.
J. Toth.
Indian Geohydrology (Calcutta), Vol 8, No 1, p 23-41, June 1972. 2 fig, 40 ref.

Descriptors: *Hydrogeology, *Reviews, Education, Hydraulics, Forestry, Engineering, Water resources development, Exploration, Geology, Geomorphology.

Hydrogeology is the science of interaction between groundwater and the rock framework. This interaction is manifested in a wide range of processes and phenomena both underground and at the land surface. Knowledge and understanding are utilized to solve scientific and technical problems of several disciplines such as water resources development, civil engineering and environmental studies, agriculture and forestry, mining, exploration for minerals and hydrocarbons, general geology, and geomorphology. The hydrogeologic parameters and relevant material properties are determined with numerous and very different techniques and methods. The very broad and advanced type of education required for the modern hydrogeologist seems to present a problem to universities indeveloping suitable curricula. (Knapp-USGS)

THERMAL SPRINGS OF INDIA AND THEIR DEVELOPMENT,
Indian Association of Geohydrologists, Calcutta.
M. S. Balasundaram.
Indian Geohydrology (Calcutta), Vol 8, No 1, p 1-9, June 1972.

Descriptors: *Thermal springs, *Thermal water, Hot springs, Geothermal studies, Thermal power, Water temperature, Hydrogeology.
Identifiers: *India.

The thermal springs of India are classified into three categories: springs located in the stable shield areas unaffected by post-Paleozoic movements; those in the shield areas affected by Mesozoic vulcanicity and/or post-Gondwana tectonism; and springs in the post-Mesozoic mobile belts. In the Indian subcontinent, except for the fumaroles and thermal springs of Naraka Kundam Island, there are no active volcanic fields. However, fumarolic or solfataras fields occur in the form of a few mild geysers in the Himalayan region. The first group is characterized by relatively low temperature, 30-35C; the temperatures of those of the second group vary from 35-75C and those of the third group vary from 50-102C. A few have temperatures above the boiling point. (Knapp-USGS)

COMPARISON OF STATISTICAL AND DETERMINISTIC APPROACHES IN THE DETERMINATION OF HYDROLOGICAL PARAMETERS OF AQUIFERS,
Bundesanstalt fuer Bodenforschung, Frankfurt am Main (West Germany).
H. J. Duerbaum, and K. Trippler.
In: Proceedings (Vol III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tuc-

son, Dec. 11-14, 1972, p 1009-1028, (1972). 11 fig, 6 ref.

Descriptors: *Groundwater basins, *Parametric hydrology, *Hydrogeology, Hydraulics, *Statistical methods, Permeability, Transmissivity, Mathematical models, Systems analysis, Flow, Pumping.
Identifiers: Errors, W. Germany.

The procedure to evaluate and interpret hydrogeological, hydrological and hydraulic data for short and long term aquifer behavior must be more or less of a statistical nature. Only in very rare ideal cases does the observed data fit the theoretical behavior of a model in all details. Thus, only to a certain extent do analog and digital models allow checking the compatibility of the data. It depends somewhat on the scale under which the aquifer is being considered. The hydrological behavior of a more or less extended polygon is to be represented in the model by a few parameters which are constants or time-dependent in a comprehensible way. The relatively great distances between the nodes of the observation grid have a smoothing influence; to a certain extent the nonrepresentative character of the observation data and the hydrogeological inhomogeneities on the other side introduce larger errors in the difference approximations of the second order derivatives. These points are demonstrated with the aid of several examples where a large amount of data is avilable which has been treated in various ways. Estimates are given on the influence of the grid mesh, the recording sequence, and other variables which can be chosen in such investigations. (See also W73-14166) (Bell-Cornell)

Identifiers: Bet guvrin catena, *Catenary soil relationships, Chalk, *Israel (Shefela), *Limestone crust, Morphology, Nari, Physical relationships, Soil.

The catena on the nari covered northern slope consists of grumusolic dark brown soil (Haplargids) on the flat hilltops, thick noncalcareous brown rendzina soil (Rendolls) on the moderate sloping uplands, typical brown rendzina on the steep slopes and brown rendzinic colluvial-alluvial soils (Haploxerolls) in narrow gullies. On soft chalk rock (southern slope) brown rendzina is replaced by pale rendzina and brown rendzinic colluvial-alluvial soils by highly calcareous colluvial-alluvial soil (Haplorthents). The origin of brown soils (brown rendzina and grumusolic dark brown soils) is attributed mainly to accumulation of aeolian dust, while the pale rendzina soils formed from the weathering of the underlying soft rocks. The leaching the decalcification stage depends mainly on soil depth, exposure and age. The shallow brown rendzinas are usually noncalcareous and the profile on the northern slope exhibits transformation of montmorillonite to kaolinite. The leaching stage of the grumusolic dark brown soil is typical of the semiarid regional climate. The soils are calcareous throughout with a typical calcic horizon at the modal depth of moisture penetration. The pale rendzinas are not leached due to their young age. Although shallow, the brown rendzinas are mature soils and cover stable slopes where the rate of erosion is slow. The pale rendzinas represent the typical mature soil of the area. The soils of gullies are young and immature, especially those encountered on chalky slopes.--Copyright 1973, Biological Abstracts, Inc.

A STUDY OF FOREST SOILS AND LEACHATES ON SLOPING TOPOGRAPHY USING A TENSION LYSIMETER,
Washington Univ., Seattle.
W. W. Bourgeois, and L. M. Lavkulich.
Can J Soil Sci. Vol 52, No 3, p 375-391. 1972. Illus.
Identifiers: *Forest soils, *Leachates, *Lysimeter (Tension), Mineralogical studies, Sloping soils, Topography, Ionic concentration.

Acrylic tension lysimeters were used to collect both vertically and horizontally moving water from soils at 2 different forest sites on sloping topography. The leachates were analyzed for ion content and the values compared within each soil, between soils, and relative to soil properties. The topographically lower site (Whatcom soil) had an accumulative leachate volume collected over the 4-mo. study period of 2387.4 l, whereas the upper slope soil (Blaney series) yielded only 901.2 l of leachate. Collected leachate volumes varied within each pedon as expressed by the Whatcom soil values of 22.8 l from the surface soil horizons increasing to 1184.0 l from the horizons immediately above the impervious glacial material. Downslope movement of water occurred throughout each pedon but to a greater extent in the subsurface horizons. Although more leachate was collected from the Whatcom soil, the ionic concentrations were similar between the 2 sites. Within the pedons the podzol B horizons had the highest ion concentrations. The general order of cation abundance was Na greater than or equal to Ca > K > Mg, which was explained by the mineralogical composition of the soils. The anions varied in their abundance but bicarbonate was generally the most abundant. Seasonal trends were indicated in both anion and cation leachate concentrations.--Copyright 1973, Biological Abstracts, Inc.

INFILTRATION AND ANTECEDENT PRECIPITATION,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
C. N. Papadakis, and H. C. Preul.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY8, Paper 9940, p 1235-1245, August 1973. 4 fig, 1 tab, 11 ref, append.

Descriptors: *Infiltration, *Antecedent precipitation, *Hortons law, Infiltration rates, Soil water movement, Infiltrometers.

A simple, inexpensive, and expedient method is presented for determining the initial infiltration capacity (fo), the decay rate of infiltration (k), and the constant infiltration capacity (fc) to be used in Horton's equation. The method consists of performing a series of infiltration tests using flooding-type test tube infiltrometers for different antecedent precipitation conditions. Horton's equation is fitted to the available data, thus obtaining values of fo, fc and k for each test. Daily rainfall records are used, starting at least 2 months prior to the infiltration tests, to determine the antecedent precipitation index values corresponding to each test. Curves of antecedent precipitation index plotted against Horton's constants provide the designer with the proper values of fo and K for the soil on which infiltration tests were performed for any specified antecedent condition. ROLE OF DEPTH AND QUALITY OF WATERTABLE ON SOIL SALINIZATION,
Central Soil Salinity Research Inst., Karnal (India).
A. K. Bandyopadhya.
Indian Geohydrology (Calcutta), Vol 8, No 1, p 56-58, June 1972. 2 fig.

Descriptors: *Saline soils, *Water table, *Irrigation effects, *Drainage effects, Leaching, Chlorides, Soil chemical properties, Soil chemistry, Soil physical properties.
Identifiers: *Soil salinization.

Both heavy- and light-textured soils are salt affected. An experiment was undertaken to study the effect of soil texture on soil salinization keeping the depth and quality of water table constant. Sand was mixed with soil to get three different soil textures having 65%, 75% and 80% sand. Water table was maintained at 120 cm below the surface. Water contained 10 meq per liter each of sodium chloride, sodium sulfate and sodium carbonate. The soil having less sand percentages contains more salts throughout the profile than the other two soils. In all the three profiles, electric conductivity is near the water table. It then decreases in the profile and gradually increases towards the soil surface. Salt content is highest on the surface soil. The result of the experiment shows that the lighter the soil texture, the less it would be affected by salinity of the groundwater, and salt accumulation in the soil profiles would also be less. (Knapp-USGS)

Pochvovedeniye, No 9, p 89-94, September 1972. 1 fig, 4 tab, 15 ref.

Descriptors: *Soil physics, *Water vapor, *Condensation, *Chernozems, *Grasslands, Forests, Atmosphere, Meteoric water, Soil moisture, Soil temperature, Thermocline, Seasonal, Instrumentation, Analytical techniques.
Identifiers: USSR, *Ukraine.

Water vapor condensation in soil was investigated in 1965-67 on thick, low-humic Chernozems of the Drabovskaya Experimental Station in the forest steppe of the Ukraine. Field investigations were conducted with condensation meters (metal boxes) 12.5 cm wide, 10 cm deep, and 20 cm long. The water supplied in summer to the root zone of soil by atmospheric vapor condensation is negligible, amounting to about 4-5 mm a year. Considerably more moisture accumulates in the upper 1.5 m of soil in winter as a result of vapor movement from lower soil layers. Winter condensation reaches 7-25 mm, depending on original soil moisture content. (Josefson-USGS)

SUBMERGED VEGETATION OF THE ROTORUA AND WAIKATO LAKES: I. 'CYCLIC CHANGE' IN LAKE ROTOITI,
Auckland Univ. (New Zealand). Dept. of Botany.
V. J. Chapman, B. T. Coffey, and J. M. A. Brown.
N Z J Mar Freshwater Res. Vol 5, No 3/4, p 461-496, 1971. Illus.
Identifiers: *Cyclic change (Vegetation), Elatine-spp, Elodea-canadensis, Glossostigma-spp, Lagarosiphon, Lakes, Lilaeopsis-lacustris, Myriophyllum-propinquum, *New Zealand (Rotoiti lake), *Submerged vegetation.

In Lake Rotoiti, North Island, New Zealand, 'cyclic change' apparently occurs among mounds of the 'Low Mixed Community' of plants; this is the first evidence of cyclic change in a wholly submerged community. The Low Mixed Community grows on gently sloping sandy substrates near the shores of bays sheltered from the prevailing SW winds, and usually extends to depths of about 1.8 m, where dense beds of Lagarosiphon major begin. Composition, distribution, growth and fate of mounds at various depths were analyzed. One species of 5 genera (namely Glossostigma spp., Elatine spp., Lilaeopsis lacustris, Elodea canadensis, and Myriophyllum propinquum) colonized bare sand and trapped more sand; as the mound grew, other species appeared. Mounds in deeper water (>0.9 m) were larger and floristically richer than those in shallower water, and were thus probably older. In calm conditions, mounds sometimes fused to form a polytypic sward. Typically, the backwash of waves eroded the shoreward ends and sides of mounds; the mounds thus became elongated parallel to the wind direction. Provided that their growth at the offshore end at least balanced erosion at their shoreward ends, some marked mounds tended to grow downslope into deeper, less often disturbed water. Although backwash started mound erosion down to 0.6 m depth, it could also erode bare areas in mounds (caused by die-off of plants, herbicide sprays, and mechanical damage) down to 1.2 m, the depth to which it normally influenced loose substrate. In exceptional easterly storms, backwash might influence plants at greater depths, and perhaps locally destroy the community so that the cycle would have to begin again. An invasion of Lagarosiphon over mound plants into depths of only 0.9 m, and for the 'Low Mixed Community' the appropriate name Glossostigmatum aquaticae is proposed because Glossostigma spp. predominated in all floristic analyses.--Copyright 1973, Biological Abstracts, Inc.

A CLASSIFICATION OF THE LAKES OF OREGON,
Oregon State Univ., Corvallis. Air and Water Resources Research Inst.
J. R. Donaldson, D. W. Larson, J. G. Malick, and R. C. Kavanaugh.
Available from the National Technical Information Service as PB-222 913, $3.00 in paper copy $1.45 in microfiche. Completion Report, June 1, 1973. 23 p, 5 fig, 16 ref. OWRR A-003-ORE (8).

Descriptors: Lakes, Classification, Limnology, Recreation, Oregon, *Hydrologic data, *Data collections, Computer programs, Thermal properties, Optical properties, Chemical properties, Biological properties.
Identifiers: *Oregon lakes, *Lake classification.

The overall objectives of the project were: to assemble information presently available concerning lakes of Oregon; to sample selected lakes in different geological areas and/or drainage basins in order to accumulate limnological data essentail for a state classification scheme; and to develop a system for recording, storage, and retrieval of lake data that would be available for general use. A list of Oregon lakes that were sampled has been compiled; it includes number of visits to each lake by year, type of information obtained on each sampling, and the computer programs used for data analysis.

HYDROBIOLOGICAL INVESTIGATION OF LAKE LERE AND NEARBY PONDS: III. CLADOCERA AND COPEPODA,
Office de la Recherche Scientifique et Technique Outre-Mer, Fort-Lamy (Chad).
R. Gras, and L. Saint-Jean.
Cah O R S T O M Ser Hydrobiol, Vol 5, No 2, p 175-178, 1971.
Identifiers: *Cladocera, *Copepoda, Hydrobiological studies, *Lake Lere (Chad), Ponds.

Hydrobiological investigation of Lake Lere and neighboring ponds revealed 24 spp. or varieties of Cladocera, 11 Copepoda (free forms), and 1 Decapoda. The Lake Lere population of planktonic crustaceans appears to be less diversified than that of Lake Chad; 3 spp. of copepods (Tropodiaptomus cf. laurenti Gauthier, 1951, Mesocyclops leuckarti (Claus, 1857), and Thermoclyclops neglectus (Sars, 1901)) and 3 spp. of cladocera (Moina micrura Kurz, 1874, Ceriodaphnia cornuta f. cornuta Sars, 1886 and rigaudi Richard, 1894, Diaphanosoma excisum Sars, 1886) were present as opposed to 4 and 8 main species (respectively) in Lake Chad. The Moina population was composed of parthenogenetic females of the typical form of M. micrura and forms with a variable number of teeth on the sides of the post-abdomen. At the time of the year when the samples were made, Rotifers were the dominant element of the zooplankton; the rarity of adult forms of copepods and cladocera was attributed to the heavy nocturnal predation of larvae of Chaoborus. Contrary to what is observed at Lake Chad, the free forms of parasitic copepods were very abundant in Lake Lere and nearby ponds. The crustacean fauna of these ponds was quite varied containing littoral and grass forms as well as planktonic ones; all were present in Lake Chad with the exception of 2 spp. As for the copepods, only 1 sp. was peculiar to the Lake Lere region. Most of the species identified have a wide range in Africa; the cladocera and cyclopid fauna of Lake Lere had the most common species with the Niger basin.--Copyright 1973, Biological Abstracts, Inc.

BIOLOGY OF THE CRUSTACEANS OF LAKE CHAD: II. DIET OF THE PLANKTONIC ENTOMOSTRACA,
Office de la Recherche Scientifique et Technique Outre-Mer, Fort Lamy (Chad).
R. Gras, A. Iltis, and L. Saint-Jean.
Cah O R S T O M Ser Hydrobiol, Vol 5, No 3/4, p 285-296, 1971, Illus, English summary.
Identifiers: Anabaena, Biology, *Lake Chad, *Chad, *Crustaceans, Diets, *Entomostraca, Lakes, Mesocyclops-leuckarti, Plankton, Thermocyclops-incisus-circusi, Thermocyclops-neglectus, Thermodiaptomus-galebi, Tropodiaptomus-incognitus, Algae.

Planktonic Entomostraca of lake Chad ingest colonial and unicellular algae which size range from 4-30 micro. Tropodiaptomus incognitus and Thermocyclops neglectus ingest Anabaena, which is important in the lake. This ingestion probably depends on nutritional condition (behavior, abundance and form and size of Anabaena's chains...). Another diaptomid, Thermodiaptomus galebi, does not ingest this algae. Mesocyclops leuckarti and Thermocyclops incisus circusi are carnivorous species, and the third cyclopoid copepod, T. neglectus, has both carnivorous and herbivorous diet. The copepodid stages of M. leuckarti are herbivorous dominant at the first stages, and carnivorous dominant at stage C5. Diet is changing progressively. The copepodid stages of T. neglectus may be considered as herbivorous-detritivorous.--Copyright 1973, Biological Abstracts, Inc.

STUDY OF CERTAIN MERISTIC CHARACTERISTICS IN ALESTES BAREMOZE OF THE LOWER CHARI AND LAKE CHAD,
Office de la Recherche Scientifique et Technique Outre-Mer, Fort Lamy (Chad).
J. R. Durand, and G. Loubens.
Cah O R S T O M Ser Hydrobiol, Vol 5, No 2, p 113-136, 1971, Illus, English summary.
Identifiers: *Alestes-baremoze, Lakes, *Meristic characteristics, *Lake Chad.

The average vertebra number (v average) is always about 1/3 higher among the females. There is no difference between sexes for the anal fin ray counts (r average). Assuming that meristic characters depend upon temperature, correlation with this factor is positive for (v average) and negative for (r average). Amplitude of distribution for and fin ray number and variability of this characteristic (up to 1 ray of variation between samples extremes) makes doubtful the existence of the Chadian subspecies which could be identified as the western subspecies. According to (r average) variations, 2 populations successively enter the river system: the first one, from April or May has, on an average, 23.7 branched anal fin rays; the other one, in July, has 24.1. These 2 populations come from the lake and make a spawning run; spawning areas are probably distinct, as they enter the system one after another. They are situated above the studied zone of the first population; for the second population they include at least Chari the river from Mailao to Fort-Lamy and Logone from Fort-Lamy to Ivie. The first population comes from east of the archipelago, in which a distinct part corresponds to fishes spawning in that region. The second population comes from the north (lake as a whole or archipelago only). When comparing with results obtained north of the lake, populations are distinguished. They differ by one or more of following characteristics: migration, number of branched and fin rays; place and time of spawning; length at first growth ring. The part of the lake used as a shelter is clearly shown: fishing, is almost solely done in the river system during A. baremoze spawning runs.--Copyright 1973, Biological Abstracts, Inc.

METHANE IN LAKE KIVU: NEW DATA BEARING ON ITS ORIGIN,
Woods Hole Oceanographic Institution, Mass.
W. G. Deuser, E. T. Degens, G. R. Harvey, and M. Rubin.
Science, Vol 181, No 4094, p 51-54, July 6, 1973. 1 tab, 14 ref.

Descriptors: *Lakes, *Methane, *Carbon dioxide, *Water chemistry, *Africa, Chemical properties, Surface waters, Bacteria, Hydrogen, Limnology, Water properties, Microorganisms, Water types, Gases, Aquatic microorganisms, Deep water.
Identifiers: *Lake Kivu.

Lake Kivu, the most western and most elevated of a string of rift lakes curving through east-central Africa, has a peculiar hydrochemistry. Its deep waters (maximum depth nearly 500 m) contain up to 0.37 liter of methane and 1.4 liter of carbon dioxide (calculated at standard temperature and pressure) per liter of water. Data obtained on two recent expeditions suggest that most of the methane was formed by bacteria from abiogenetic carbon dioxide plus hydrogen, rather than by volcanic action or from decomposing organic matter. A PROBABILISTIC APPROACH TO THE DYNAMICS OF NATURAL POPULATIONS OF THE CHYDORIDAE (CLADOCERA, CRUSTACEA),
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
R. Keen.
Ecology, Vol 54, No 3, p 524-534, Late Spring, 1973. 7 fig, 30 ref.

Descriptors: *Animal populations, *Seasonal, *Dominant organisms, *Crustaceans, Sampling, Separation techniques, Biological communities, Reproduction, *Michigan, Community development, Fecundity, Invertebrates, Predation, Probability, Waterfleas.
Identifiers: Acroperus harpae, Graptoleberis testudinaria, Chydorus sphaericus, Camptocerus cf. rectirostris, Data interpretation, Cladocera, Macroinvertebrates, *Lawrence Lake (Mich.).

Populations of four chydorids in the littoral of Lawrence Lake, Michigan, were studied through an entire year. Samples were collected (at 2 to 7 day intervals) by lowering an inverted, 1-liter container to the proper depth and then letting it fill with water. Samples were transferred to beakers, allowed to settle, and gently heated to stimulate the chydorids to swim to the surface thereby separating themselves from debris. The water and animals were then decanted. Samples were concentrated with a net to about 10 ml and preserved with 95 percent ethanol. These were examined for counts of species and individual reproductive stages. Four species of chydorids dominated the samples: Acroperus harpae Baird, Graptoleberis testudinaria (Fischer), Chydorus sphaericus (O.F.M.), and Camptocerus cf. rectirostris Schodler. Through the entire year, these represented at least 75 percent, and usually more, of the chydorid numbers in each sample. Acroperus, Graptoleberis, and Camptocerus appeared in spring after a winter absence and reached maximum population in late summer or fall. Chydorus sphaericus peaked in spring and dropped to a low level in the summer, then rose through fall to a winter plateau. Predicted rates of birth were higher during summer when rates of observed change fluctuated considerably. A probabilistic method, based on reproductive potential, showed relatively large probabilities for changes observed from late fall to early spring in populations of Chydorus. Most population changes in the other three species, and in Chydorus during the summer, had zero probability. Most population loss appears to be predatory, emigation and 'natural' mortality are not important. (Little Battelle)

2I. Water in Plants

THE EFFECTS OF WATER MANAGEMENT PRACTICES ON THE MOVEMENT OF LARGEMOUTH BASS,
Mississippi State Univ., State College. Water Resources Research Inst.
W. J. Lorio, R. L. Warden, Jr., and T. D. Thornhill.
Available from the National Technical Information Service as PB 222 904, $3.50 in paper copy, $1.45 in microfiche. July 1973. 46 p, 29 fig, 1 tab, 7 ref. OWRR A-066-MISS (1).

Descriptors: *Fish behavior, *Fish migration, *Water temperature, Fish habitats, *Bass, *Tagging, Tracking techniques, Seasonal.
Identifiers: *Ultrasonic tracking.

Ultra sonic tracking proved to be a successful method for studying the behavior of largemouth bass in relation to water manipulation and other environmental parameters. Several preferred locations were selected by bass released in the spring and fall as opposed to one location by bass released in the summer and winter. Movement and activity were greater during the spring and fall and could explain the selection of more than one location for a home area. Three of the sonic tagged bass returned to the point of original capture after orientation. Remaining bass all passed their capture site at least once during their migration to other areas. Water temperature was the only parameter that could be associated with increased or decreased movement. Temperatures ranging from 50-75 deg were associated with peak movement. Water manipulation affected the acreage of bass habitat available but resulted in neither increased nor decreased movement. Home range varied with the time of the year. A maximum range of 400 feet was exhibited by bass in March and September. These months were also associated with peak movement periods. Range varied during the remaining months from 100 feet in summer to 250 feet in spring and fall.

BIOTA OF FRESHWATER ECOSYSTEMS, IDENTIFICATION MANUAL NO. 1, FRESHWATER PLANARIANS TURBELLARIANS) OF NORTH AMERICA,
Smithsonian Institution Washington, D.C. Dept. of Invertebrate Zoology.
R. Kenk.
Copy available from GPO Sup Doc as EP1.16:18050 ELD 02/72, $2.50; microfiche from NTIS as PB-222 922, $1.45. Environmental Protection Agency, Water Pollution Control Research Series, February 1972, 81 p, 96 fig, 65 ref. EPA Project 18050 ELD 02/72.

Descriptors: *Aquatic fauna, Life cycles, Preservation, Distribution patterns, *North America.
Identifiers: *Identification manual, Illustrated key, *Freshwater planarians, *Triclads, *Turbellaria, Species list, Collection, Culture, Anatomy, Distinguishing characteristics, Ecological requirements.

A key is presented for the identification of the species of North American freshwater triclads or planarians known at present. Introductory chapters deal with the collecting, culturing, preservation, study, and general organisation and life cycle of planarians. The key is followed by a listing of the species and subspecies, giving their distinguishing characteristics, ecological requirements, and geographical ranges. Illustrations depict the external appearance and diagrams of the reproductive organs of the individual taxa. The principal literature for each species is indicated and listed in the appended bibliography of 65 items. An index of the generic and specific names and synonyms concludes the report. One new subspecies, Polycelis coronata brevipenis is established for L. H. Hyman's Polycelis coronata. (EPA)
W73-13736

BIOTA OF FRESHWATER ECOSYSTEMS, IDENTIFICATION MANUAL NO. 2, THE GENUS ARGULUS (CRUSTACEA; BRANCHIURA) OF THE UNITED STATES,
Smithsonian Institution, Washington, D.C.
R. F. Cressey.
Copy available from GPO Sup Doc as EP1.16:18050 ELD 02/72, $2.50; microfiche from NTIS as PB-222 923 $1.45. EPA Report Water Pollution Control Research Series, February 1972. 14 p, 6 fig, 4 ref. EPA Project 18050 ELD 02/72.

Descriptors: *Aquatic fauna, United States, *Fish parasites, Distribution patterns.
Identifiers: Identification manual, Illustrated key, *Freshwater Branchiura, *Crustacea, *Argulus.

Twenty three species of Argulus are recognised as valid from the 37 reported from the United States. An illustrated key is provided to these species. Distribution and host records are also included. (EPA)

BIOTA OF FRESHWATER ECOSYSTEMS, IDENTIFICATION MANUAL NO.3, FRESHWATER SPHAERIACEAN CLAMS (MOLLUSCA: PELECYPODA) OF NORTH AMERICA,
Michigan Univ., Ann Arbor. Museum of Zoology.
J. B. Burch.
Copy available from GPO Sup Doc as EP1.16: 13050 ELD 03/72, $2.50; microfiche from NTIS as PB-222 924, $1.45. EPA Report, Water Pollution Control Research Series, March 1972. 31 p, 34 fig, 14 ref. EPA Project 18050 ELD 03/73.

Descriptors: *Aquatic fauna, Freshwater, *Mollusks, *Pelecypods, *Clams, Preservation, Distribution patterns, North America.
Identifiers: *Identification Manual, Illustrated key, *Sphaeriacea, Species List.

Bivalved mollusks of the superfamily Sphaeriacea (Order Heterodonta) are represented in North America by 34 native and four apparently introduced species of the cosmopolitan freshwater Sphaeriidae and by one introduced species (Corbicula manilensis) of the Afro-Oriental family Corbiculidae. The North American Sphaeriidae include three genera: Sphaerium with 12 species, Pisidium with 25 species, and Eupera with one species. The genera Sphaerium and Pisidium are world-wide in distribution and occur in all North American states and provinces. Eupera is restricted to the Western Hemisphere: northern South America, Central America and the southern Coastal Plain of eastern North America. Although characters of soft anatomy are used in taxonomy of the Sphaeriacea, especially in the classification at the generic level and above, all taxa can be identified readily by characters of the shells, and such shell characters are particularly important in distinguishing the species. The main feature of this publication is an illustrated toxonomic key using shell characters for identification of the 39 species of North American Sphaeriacea. (EPA)
W73-13738

BIOTA OF FRESHWATER ECOSYSTEMS, IDENTIFICATION MANUAL NO. 4, FRESHWATER POLYCHAETES (ANNELIDA) OF NORTH AMERICA,
Smithsonian Institution, Washington, D.C. Dept. of Invertebrate Zoology.
N. Foster.
Copy available from GPO Sup Doc as EP1.16:18050 ELD 03/72, $2.50; microfiche from NTIS as PB-222 925, $1.45. EPA Report, Water Pollution Control Research Series, March 1972. 15p, 5 fig, 10 ref. EPA Project 18050 ELD 03/72.

Descriptors: *Aquatic fauna, Freshwater, Preservation, Distribution patterns, North America.
Identifiers: *Identification Manual, Illustrated Key, *Freshwater polychaeta, *Annelida, Species list.

Eight species of freshwater polychaetes are reported in the form of a key. Three families are represented: Nereidae with six species; Sabellidae with one species; Serpulidae with one species. The key includes only those polychaetes actually collected from freshwater and not those reported to withstand low salinities under experimental laboratory situations. Collection and preservation methods are discussed as well as characters used in specific identification. (EPA)
W73-13739

BIOTA OF FRESHWATER ECOSYSTEMS, IDENTIFICATION MANUAL NO. 5, THE FRESHWATER AMPHIPOD CRUSTACEANS (GAMMARIDAE) OF NORTH AMERICA,
Old Dominion Univ., Norfolk, Va.
J. R. Holsinger.
Copy available from GPO Sup Doc as EP1.16:18050 ELD 04/72 $2.75; microfiche from NTIS as PB-222 926, $1.45. EPA Report, Water Pollution Control Research Series, April 1972. 89 p, 32 fig, 67 ref. EPA Project 18050 ELD 04/72.

Descriptors: *Aquatic fauna, *Amphipoda, Preservation, Distribution patterns, North America.
Identifiers: *Identification Manual, Illustrated key, *Crustacea, *Gammaridae, Species list, Ecology.

The amphipod crustacean family Gammaridae is represented in the freshwaters of North America by eight genera and 81 described species; numerous other species are still undescribed. These eight genera, with the number of described North American freshwater species in parentheses, include: Gammarus (9), Crangonyx (18), Synurella (4),Apocrangonyx (6), Stygonectes (29), Stygobromus (10), Bactrurus (3), and Allocrangonyx (2). Ecologically, the freshwater gammarids are an important group of aquatic invertebrates, with species found in a variety of biotopes, including lakes, streams, ponds, swamps, springs, and subterranean waters.
W73-13740

BIOTA OF FRESHWATER ECOSYSTEMS, IDENTIFICATION MANUAL NO. 6, AQUATIC DRYOPOID BEETLES (COLEOPTERA) OF THE UNITED STATES,
Oklahoma Univ., Norman. Dept. of Zoology.
H. P. Brown.
Copy Available from GPO Sup Doc as EP1.16:18050 ELD 04/72, $2.50; microfiche from NTIS as PB 222 927, $1.45. EPA Report, Water Pollution Control Research Series, April 1972. 82p, 198 fig, 45 ref. EPA Project 18050 ELD 04/72. 14-12-894.

Descriptors: *Aquatic fauna, *Insects, *Water beetles, United States, Preservation, Distribution patterns.
Identifiers: *Identification manual, Illustrated key, *Coleoptera, *Dryopoidea.

An illustrated key is given for all known species of adult dryopoid beetles of the United States which have aquatic stages and might be useful as indicators of water quality. A key is also given to the genera of larvae. For each species the known habitat and range are given. Life histories are briefly outlined and methods for collection, preservation, storage, and identification are suggested. Two new species, Optioservus ozarkensis Collier and Optioservus sandersoni Collier, are described. The genera included in the keys are: Chelonariidae--Chelonarium; Elmidae--Tribe Larini: Lara, Phanocerus; Tribe Elmini: Ampumixis, Ancyronyx, Atractelmis, Cleptelmis, Cylloepus, Dubiraphia, Elsianus, Gonielmis, Heterelmis, heterlimnius, Hexacylloepus, Macronychus, Microcylloepus, Narpus, Neocylloepus, Neoelmis, Optioservus, Ordobrevia, Oulimnius, Promoresia, Rhizelmis, Stenelmis, Zaitzevia; Dryopidae Dryops, Helichus, Pelonomus; Limnichidae--Limnichinae: Limnichus, Lutrochus, Physemus; Cephalobyrrhinae: Throscinus; Psephenidae--Eubriinae: Acneus, Dicranopselaphus, Ectopria; Eubrianacinae: Eubrianax; Psepheninae: Psephenus; Ptilodactylidae--Anchycteis, Anchytarsus, Stenocolus. The bibliography includes selected references in addition to the literature cited. (EPA)

BIOTA OF FRESHWATER ECOSYSTEMS IDENTIFICATION MANUAL NO. 9, CRAYFISHES (ASTACIDAE) OF NORTH AND MIDDLE AMERICA,
Smithsonian Institution, Washington, D.C.
H. H. Hobbs.
Copy available from GPO Sup Doc as EP 1.16:18050 ELD 05/72 $3.25; microfiche from NTIS as PB-222 930, $1.45. EPA Report, Water Pollution Control Research Series, May 1972. 173 p, 115 fig, 134 ref. EPA Project 18050 ELD 05/72. 14-12-894.

Descriptors: *Aquatic fauna, *Crustacea, *Crayfish, Distribution, Preservation patterns, North America.
Identifiers: *Identification manual, Illustrated key, *Decapoda, *Astacidae, Central America, Species list.

A brief introduction includes discussions of the systematic position of the 284 recognized species and subspecies of American crayfishes, their introductions into various regions of the United States and foreign lands, their habitats, methods of collecting and preservation, and problems of identification. Included in the series of illustrated keys that constitute the major part of the work are indications of the habitats and range of each crayfish. A list of selected references is followed by two appendices: one summarizing the distribution of each crayfish and the other consisting of a list of states and provinces with references to the crayfish that occur within them. An index to the taxa included constitutes the final section. (EPA)

BIOLOGICAL STUDIES ON THE FRESHWATER SHRIMPS IN KOREA: III. THE FOOD AND GROWTH OF THE LARVAE OF PALAEMON MODESTUS,
Pusan Fisheries Coll. (Republic of Korea).
K-S. Chung.
Bull Korean Fish Soc, Vol 4, No 2, p 55-60, 1971, Illus, English summary.
Identifiers: Biological studies, Food, Growth, Hatching, *Korea, Larvae, Palaemon-modestus, *Shrimps (Freshwater).

Shrimps were collected from the Karak River and carried to the laboratory; hatched larvae were reared. The hatching period in the laboratory water tank was 8 hr (20 deg C approximately 20.9 deg C). The larvae died off from the 6th day after hatch without food. Feeding began on the third day after hatch. The relationship between density of food and consumption was not concerned when the number of Artemia nauplii was 2-6/ml of water. The relationship between the day (X) and the food (Y) is: $Y \pm 6.49824X1.18384$. The carapace growth curve is: $Y \pm 1.1608X0.10024$. The relationship between food (X) and body length (Y) is: $Y \pm 2.8114X0.12767$. The relationship between the carapace length and body length (Y) is: $Y \pm 3.7564X-0.4601$.--Copyright 1973, Biological Abstracts, Inc.

WATER AND PHOTOSYNTHESIS RELATIONS OF DESERT PLANTS IN THE MAURITANIAN SAHARA: II. ALTERNATING-GREEN, SWITCH-BRANCHED AND STEM-SUCCULENT TREES,
Technische Hochschule, Darmstadt (West Germany).
O. Stocker.
Flora (Jena), Vol 160, No 5, p 445-494, 1971, Illus, English summary.
Identifiers: *Desert plants (Trees), Adenium-honghel, Arid lands, Boscia-senegalensis, Calotropis-procera, Capparis-decidua, Climates, Deserts, Desiccation, Leptadenia-pyrotechnica, Morphology, Nitraria-retusa, *Photosynthesis, Relations, Salvadora-persica, Tamarix-senegalensis, Transpiration, Trees, *Sahara (Mauritanian).

The following species were investigated: Nitraria retusa, Tamarix senegalensis, Leptadenia pyrotechnica, Capparis decidua, Calotropis procera, Adenium honghel. They are types intermediate between the deciduous-raingreen (Acacia raddiana) and the true evergreen constitutions (Boscia senegalensis, Salvadora persica). The dilemma within the arid period, dry up or die of hunger, is solved either by the seasonable alternation of leaves, adapted to arid or rainy season by structure and quantity (Nitraria, Calotropis), or by evergreen switch-branches (Tamarix, Leptadenia, Capparis). In the stem-succulent, raingreen Adenium the green cortex is of decisive importance. In spite of the large differences within the morphological structures, all types show a noteworthy stability and quantity of the water and photosynthesis turn-over, which is made possibly by an accurate regulation of the transpiration.--Copyright 1973, Biological Abstracts, Inc.
W73-13801

A DOUBLE-WALLED PLANT CONTAINER OF PLASTIC WITH AUTOMATIC WATERING (IN GERMAN),
Landesanstalt fuer Immissions- und Bodennutzungsschutz des Landes Nordrheim-Westfalen, Essen (West Germany).
H. Van Haut, G. Scholl, and G. Van Haut.
Landwirtsch Forsch, Vol 25, No 1, p 42-47, 1972. Illus, English summary.
Identifiers: Automatic systems, *Plant containers, Plastic, Watering plants.

The rectangular container consists of a jacket vessel containing the water reserve and an inserted pot for growing the plants which is equipped with 2 ceramic cylinders. In response to the soil water potential, water is sucked in from the reserve through tubes by capillary effect. The ceramic cylinders, serviceable from outside, are installed at the upper part of the inner pot and keep the germination bed sufficiently moist. In centralizing the water supply, several vessels can be connected with each other in such a manner that soil washout and transport of nutrients from one vessel to another is avoided. The vessels are white outside and black inside to prevent the growth of algae.--Copyright 1973, Biological Abstracts, Inc.
W73-13803

CHANGE OF CARP HELMINTH FAUNA DUE TO SUMMERING IN STREAMS,
Zooveterynarnyi Instytut, Lvov (USSR).
V. M. Ivasik, I. M. Karpenko, and O. P. Kulakovskaya.
Helminthologia (Bratisl) 10 p 171-175 1969 (1971).
Identifiers: *Carp, Fauna, *Helminth fauna, Parasites, Streams, Summering.

The effect of summering in streams on helminthofauna of carp and carp hybrids was analyzed on the basis of results of parasitological discoveries by the usual methods. Fish (1000) of various ages and various categories (nonspawning, growing, fattening, and wintering) were studied from 1949-1966. Ponds after summering are stocked with healthy fish, which have passed through an antiparasitic bath. Species (14) of helminths were found, with varying patterns of invasion. Summering in streams facilitates reduction of contamination of fish by parasites, especially by helminths with a complex cycle of development. Fish productivity increased in all areas studied.--Copyright 1973, Biological Abstracts, Inc.

LARGER SEEDS OF WINTERFAT GERMINATE BETTER,
Forest Service (USDA), Albuquerque, N. Mex. Rocky Mountain Forest and Range Experiment Station.
H. W. Springfield.
Journal of Range Management, Vol 26, No 2, p 153-154, March 1973. 1 tab, 1 fig, 7 ref.

Descriptors: *Seeds, Size, *Germination, *Forages, *New Mexico, Shrubs, Plant growth, Vegetation establishment, Temperature, Lighting, Laboratory tests, Moisture, Environmental effects.
Identifiers: *Winterfat, Seedlings.

Usually larger seeds of a plant produce not only more vigorious seedlings than smaller seeds but often yield higher germination results also. In this study to determine the effects of size on germination, ripe fruits of winterfat were collected from plants near Corona, New Mexico, separated into 3 size classes, and germinated in the laboratory at four different temperatures under varying light and dark regimes. At all four temperatures total germination was higher and more rapid for large and medium seeds than for small seeds. Maximum germination of smaller seeds may be possible only when such external factors as moisture and temperature are optimum; therefore fewer seedlings may be produced in a field environment. SOIL PROPERTIES AND NUTRIENT AVAILABILITY IN TARWEED COMMUNITIES OF CENTRAL WASHINGTON,
Forest Service (USDA), Wenatchee, Wash. Forest Hydrology Lab.
A. R. Tiedemann.
Journal of Range Management, Vol 25, No 6, p 438-443, Nov. 1972. 2 fig, 2 tab, 19 ref.

Descriptors: *Nutrient requirements, *Soil physical properties, *Revegetation, *Frost heaving, Soil-water-plant relationships, *Washington, Grasses, Seeds, Infiltration rates, Heat flow, Heat transfer, Soil moisture, Plant groupings.
Identifiers: *Tarweed, Needlegrass.

Nutrient levels and nutrient availability of soils were evaluated by comparing certain soil physical properties between tarweed communities and adjacent stable, productive needlegrass communities. The vegetation pattern of abrupt breaks in the grassland vegetation resulting in a mosaic of barren areas, dominated by cluster tarweed, appears to have resulted from intensive frost action associated with a periglacial climate. Revegetation studies have shown that competition for moisture by cluster tarweed, and frost heaving of new grass seedlings prevent revegetation. An abrupt drop in soil surface between needlegrass and tarweed communities indicates that much of the topsoil is either missing or has never developed, correlating the possibility that soil nutrients are a limiting factor in the tarweed community. The effect of higher bulk density and lower organic matter content on the microenvironment of tarweed soils probably contribute to rapid heat exchange between soil and atmosphere, rapid heat transfer within the soil, reduced infiltration, and rapid drying of soil surface. (Bahre-Arizona)

NITROGEN AND PHOSPHORUS AVAILABILITY IN A FERTILIZED RANGELAND ECOSYSTEM OF THE NORTHERN GREAT PLAINS,
Agricultural Research Service, Sidney, Mont.
A. L. Black, and J. R. Wight.
Journal of Range Management, Vol 25, No 6, p 456-460, Nov. 1972. 4 fig, 3 tab, 14 ref.

Descriptors: *Plant growth, *Nutrient requirements, *Fertilization, *Phosphorus, *Nitrogen, Ammonium compounds, Soil temperature, Soil water, Semiarid climates, Great Plains, *Montana, Ecosystems, Ranges.

The effect of high rate fertilization on plant growth and nutrient uptake was investigated on a native range site (Bouteloua-Carex- (Stipa) faciation of a mixed prairie association) near Sidney, Montana. Combinations of ammonium nitrate applied at rates of 0, 100, 300, and 900 lb/N/acre and concentrated superphosphate at rates of 0, 100, and 200 bl/P/acre increased total forage about 2.0-fold. Plants growing on the high N-P fertilizer plots began growth earlier and grew faster in the spring of both years than plants growing on unfertilized plots. High soil P levels reduce the sensitivity of plants to cool soil temperature, and N availability stimulates early plant growth. Timely nutrient availability is an extremely important growth aspect in relation to efficient plant utilization of stored soil water and growing season precipitation in a relatively cool, semiarid climate. Also included are data on the depth concentration of N and P in the soil layers and the variation within the 2-year study. (Bahre-Arizona)
W73-14001

ENERGY FIXATION AND PRECIPITATION--USE EFFICIENCY IN A FERTILIZED RANGELAND ECOSYSTEM OF THE NORTHERN GREAT PLAINS,
Agricultural Research Service, Sidney, Mont.
J. R. Wight, and A. L. Black.
Journal of Range Management, Vol 25, No 5, p 376-380, Sept. 1972. 4 fig, 1 tab, 19 ref.

Descriptors: *Ecosystems, *Nutrient requirements, *Soil water, *Energy budget, Genetics, Nitrogen, Phosphorus, Great Plains, *Montana, Semiarid climates, Efficiencies, Ranges, Cycling nutrients, Genetics.

At least 3 factors play dominant roles in regulating energy-fixing capabilities of rangeland ecosystems: soil water availability, genetic potential of chlorophyll-bearing plants in the ecosystem, and nutrient availability. The latter seems to play a more important part than soil water availability. Plant nutrients, particularly N and P, play a vital role in the energy-fixing processes of rangeland ecosystems in the northern Great Plains. The ecosystems appear to be functioning at an energy level about one-third to one-half that obtainable when N and P availability is adequate. Nutrient cycling, which is directly influenced by climatic factors such as temperature and water, appears inadequate to supply nutrients at rates needed to maintain levels of production consistent with climatic conditions. COMPARATIVE STUDIES ON THE DEPENDENCE OF AQUATIC COLEOPTERA TO THEIR ENVIRONMENT IN THE AREA OF NEUSS,
K. Koch.
Decheniana, Vol 124, No 2, p 69-112, 1971, (1972), Illus, English summary.
Identifiers: Aquatic plants, *Beetles, *Coleoptera, Comparative studies, Dependence, Environment, *Germany (Neuss).

In the district of Neuss (Rhineland) the aquatic life of 8 different kinds of water were studied. The dependence of aquatic beetles upon water temperature and depth, upon the total hardness of the water and upon the plant-life in and about those waters was established. These factors, among others, have an influence on the species and upon the population density of the environment.--Copyright 1973, Biological Abstracts, Inc.
W73-14005

STUDIES OF THE HELMINTH FAUNA OF NORWAY: XX. SEASONAL CYCLES OF FISH PARASITES IN THE GLOMMA,
Zoologisk Museum, Oslo (Norway).
O. Halvorsen.
Norw J Zool, Vol 20, No 1, p 9-18, 1972, Illus.
Identifiers: Acanthocephala, Cestodes, *Fauna (Helminth), Fish, Nematode, *Norway (Glomma River), *Parasites (Fish), Reproduction, Rivers, Seasonal, Trematodes.

Parasite species (15) including cestodes, trematodes, acanthocephala and nematodes found on 5 fish species in the river Glomma, southeastern Norway, were investigated for seasonality in occurrence and reproduction. The reproductive cycles of the ectoparasites were very uniform with a peak in June. This shows that water temperature acts directly on these parasites and governs their maturation and egg production. The differences in occurrence noted among the ectoparasites are caused by difference in longevity and reproductive behavior of the parasite and seasonal variations in the ecology of the hosts. Also the seasonal cycles of the endoparasites may be understood on this background taking into account that seasonality in 1 or more intermediate hosts may modify the basic temperature dependent cycle. In only 1 case was it not possible to separate maturation and egg production in the parasite from the sexual cycle of the fish host.--Copyright 1973, Biological Abstracts, Inc.

THE ROTIFER FAUNA OF ROCK-POOLS IN THE TVARMINNE ARCHIPELAGO, SOUTHERN FINLAND.
Bergen Univ. (Norway). Zoological Museum.
B. G. Bjorklund.
Acta Zool Fenn. 135p 3-30. 1972, Illus.
Identifiers: Fauna, *Finland (Tvarminne archipelago), Records, Rock pools, *Rotifer fauna.

Altogether, 63 spp. were found in 68 samples from 50 pools, of which 16 are situated on 5 islands in the outer archipelago zone, and the remainder on 5 islands in the sea zone. The pools are classified into 6 types based mainly on their location, exposure, macrovegetation, bottom sediment, water color, size, and to a lesser degree on salinity and pH. The rotifer species characteristic of each type are indicated. An analysis of communities is made for the 22 most common species by use of a trellis diagram. Three main rotifer associations are found, corresponding quite well with the dominating species in 3 of the pool types. Taxonomic and ecological notes are provided for the poorly known or questionable species, and 21 spp. are shown in figures. Some rather similar Lepadella species are discussed on the basis of a biometric analysis. Eleven species are new to Finland.--Copyright 1973, Biological Abstracts, Inc.

VEGETATION OF THE HYDROGRAPHIC REGION OF THE MOORS ON THE VELKE DARSKO POND (BOHEMIAN-MORAVIAN HIGHLAND). (IN CZECH),
Ceskoslovenska Akademie Ved, Prague. Biologicky Ustav.
R. Neuhaeusl.
Folia Geobot Phytotaxon, Vol 7, No 2, p 105-165, 1972, Illus, English summary.
Identifiers: Carex-Chordorrhiza, Cereal, Communities, Crops, *Czechoslovakia Bohemian-Moravian highlands, Festuca-tenuifolia, Forests, Highlands, *Hydrographic region, Juncus-squarrosus, Meesia-triquetra, Minerals, Moors, Paludella-squarrosa, Pond, Scorpidium-scorpioides, Soils, Spruce, *Vegetation, Weeds.

The plant cover of a small territory in the central part of the Bohemian-Moravian Highlands (Czechoslovakia) is described. Subatlantic-montane species such as Juncus squarrosus and Festuca tenuifolia are characteristic, besides submontane forest species, peat-bog species and some relic blanket-bog species (Carex chordorrhiza, Scorpidium scorpioides, Paludella squarrosa, Meesia triquetra). The moderate xerothermic species only seldom penetrate on chalky soils up to the centrum of the territory. The vegetation is noted for many communities, however poor in species. Floating-leaved communities, reed and tall sedge communities, secondary stages of the ancient pools (rising after peat digging) and drainage channels, and

peat-bog meadows of the alliance Caricion canescenti-fuscae Nordh. are described. The semicultivated meadows formed by amelioration of peat-bog meadows were described as Carici-Festucetum rubrae ass. nova prov. The most frequent cultivated meadow of the mineral soils was identified with Trifolio-Festucetum rubrae Oberd. (alliance Arrhenatherion elatioris (Br.-Bl. 1925) W. Koch 1926). The pastures are represented by 2 clear cut associations (Nardo-Festucetum capillatae Klika et Smarda and Nardo-Juncetum squarrosi (Nordh.) Buker) and by an insufficiently known group of the Hygro- up to Xeronardeta. The dwarf shrub heaths grow on the drained and deforested parts of the peat-bogs, somewhat less on rough mineral soils. The natural spruce forests (Calamagrosti villosae-Piceetum F. K. Hart.) of the alliance Vaccinio-Piceion are bound with damp and cool terrain depressions in the investigated territory which is situated in the Fagion zone. They are spread secondarily on the dead, partly drained, margins of the peat-bogs. The cultural forests were divided on the basis of their correspondence to the natural potential vegetation. Two groups of field weed communities, corresponding to the eutrophic (on chalky soils) and oligotrophic (on silicate rocks) substrates were distinguished. Practically no differences have been found between weed communities of the cereal and intertilled crops.--Copyright 1973, Biological Abstracts, Inc.

PHYTOSOCIOLOGICAL STUDIES ON GREEN MEADOW VEGETATION OF TAMA RIVER NEAR TOKYO, WITH A COMPARATIVE STUDY OF THE VEGETATION OF THE TONE RIVER,
Yokohama Municipal Univ. (Japan).
A. Miyawaki, and S. Okuda.
Vegetatio, Vol 24, No 4-6, p 229-311, 1972, Illus.
Identifiers: Comparative studies, *Japan (Tama River), Meadows, *Phytosociological studies, Rivers, Soils, Succession, Tone, Vegetation.

Phytosociological study of the green meadows of the Tama river, Japan, revealed 19 new associations and 6 new alliances. Most frequently occurring associations are Phragmitetea (Oenantho-Phalaridetum arundinaceae, Miscanthetum sacchariflori, Caricetum dispalatae), Bidentetea (Panico-Bidention, Alopecurion amurensis), Plantaginetalis asiaticae (Agropyro kamoji-Rumicion japonicae), annual dwarf rush associations (Lindernion procumbentis) and Artemisietea princeps (Anaphalio-Artemision princeps). The association complexes of the meadows were produced by slight differences in conditions produced by the effects of water, by the intensity of erosion and accumulation and by the particle size of the deposited material. A close coincidence was observed between plant association and soil profile. Zonation of the plant associations is closely related to the water level and soil conditions. Succession of these associations is rarely completed because of the flooding and constant renewal of the soil. A theoretical succession process on the Tama River is presented. The vegetation units observed are ecologically comparable and vicarious with associations from similar locations in Europe. Vegetation maps are included.--Copyright 1973, Biological Abstracts, Inc.

PHYTOSOCIOLOGICAL AND MYCOLOGICAL EXPLORATION OF THE RIXENSART HEATH AND THE LAND APPROACHING IT,
D. Thoen, and A. Bracke.
Nat Belg. Vol 52, No 5, p 225-244 1971. Illus.
Identifiers: Acid, Alder, *Belgium (Rixensart heath), Birches, Calluna, Destruction, Drosera-Rotundifolia, Exploration, Habitat, Heath, Land, Molina, *Mycological studies, *Phytosociological studies, Succession, Willows.

Reexamination of the Rixensart heath (Belgium) showed the botanical landscape to be in the midst of considerable evoution. The heath with Calluna shows a trend towards recolonization by the forest due to progressive abondoning of the practice of regular burning and grazing. The peat bog noted in 1941 has been colonized by the forest and is now in the form of a peaty thicket of willows, black alder, and birches. Observations on a stream of acidic water with Drosera rotundifolia indicated a certain stability of this grouping mainly due to frequent week-end trampling of the area by scouts. A basiclinal alder grove and meadows with high hygrophilous grasses are undergoing ruderalization and progressive filling because of dumping of earth and trash. Presently the abandoning of mowing is modifying the structure of the vegetation of meadows with Molinia. New villas and roads are also taking land and modifying the Rixensart heath.--Copyright 1973, Biological Abstracts, Inc.

CONTRIBUTION TO THE KNOWLEDGE OF THE FOREST ASSOCIATIONS OF THE LESSER CARPATHIANS, SLOVAKIA: 2. HABITAT CONDITIONS,
Ceskoslovenska Akademie Ved, Prague. Botanicky Ustav.
Z. Neuhaeuslova-Novotna.
Folia Geobot Phytotaxon, Vol 6, No 4, p 337-368, 1971, Illus, English summary.
Identifiers: Allium-ursinum, Beam, Carex-pilosa, *Czechoslovakia (Lesser Carpathians), Deschampsia-flexuosa, Dryopteris, *Forests, Genista, Habitat, Horn, Luzula-Spp, Oak, Primula, Sesleria-mercurialis, Soil types, *Ecological studies.

The ecological character of forest communities in the southern part of the Lesser Carpathians (Czechoslovakia) is discussed. The following communities were analyzed: a Carpathian oak-hornbeam forest Carici pilosae-Carpinetum with the moister Dryopteris subass., a typical subass., and the acidophilous Luzula albida subass., a secondary Primula oak-hornbeam forest on calcareous soils, originating from Cephalanthero-Fagetum or Carici-Carpinetum as may be demonstrated by soil types (brown rendzina-Cephalanthero-Fagetum, rendzina-braunerde-Carici pilosae-Carpinetum), an acidophilous subassociation of the mostly secondary, somewhat drier Festuco heterophyllae-Quercetum, an alluvial ash-alder forest Stellario-Alnetum in lower situated valleys with the moister Chrysosplenium subass. and Allium ursinum subass. on fresh soils, an alluvial forest Carici remotae-Fraxinetum on wet to swampy soils (nassgley), a Carpathian herbrich beech forest Dentario-Fagetum with the slightly oligotrophic Carex pilosa subass. and the very eutrophic Mercurialis subass., a calcareous beech forest Cephalanthero-Fagetum with the moister Circaea subass., a typical subass. and the very thermophilous Carex alba subass., a calcareous ravine forest Phyllitidi-Aceretum on shady slopes in submontane to montane regions, an acidophilous beech forest Luzulo-Quercetum with the slightly acidophilous Luzula subass. and the more oligotrophic Deschampsia flexuosa subass., xerophilous calcareous oak shrub forests of the Eu-Quercion pubescentis suballiance with the Sesleria xerophilous oak forest occurring on ridges and the more xerophilous Ceraso-Quercetum pubescentis on sunny slopes in the warmest regions, an acidophilous oak forest ofthe lower regions, Luzulo-Quercetum, with a typical subass. and the Genista subass.--Copyright 1973, Biological Abstracts, Inc.

LANDSLIDES AT BRECKENRIDGE, PINEVIEW GOLF CLUB, AND ROCKCLIFFE,
National Research Council of Canada, Ottawa (Ontario). Div. of Building Research.
R. J. Mitchell.
Available from National Research Council of Canada, Div of Building Research, Ottawa, Canada Price $0.50. Technical Paper No 322, September 1970. 19 p, 21 fig, 6 ref.

Descriptors: *Landslides, *Canada, *Clays, Soil strength, Mass wasting, Fissures (Geologic), Rheology, Rock mechanics, Soil mechanics.
Identifiers: *Ottawa (Ontario).

Landslides in the Ottawa area involve clay containing a system of small fissures. At low stress levels, the fissures give rise to dilatant behavior and predominantly frictional shearing resistance. Stability analyses based on these considerations result in reasonably good correlations between field measurements and strengths measured by soil testing procedures. (Knapp-USGS)

BALANCE OF REDUCING PROCESSES IN SEDIMENTS OF THE PACIFIC OCEAN (BALANS REDUKTSIONNYKH PROTSESSOV V OSADKAKH TIKHOGO OKEANA),
Akademiya Nauk SSSR, Moscow. Geologicheskii Institut.
N. M. Strakhov.
Litologiya i Poleznyye Iskopayemyye, No 4, p 65-92, July-August 1972. 9 fig, 7 tab, 18 ref.

Descriptors: *Geochemistry, *Reduction (Chemical), *Sediments, *Pacific Ocean, Sea water, Sediment-water interfaces, Inorganic compounds, Sulfides, Organic matter, Profiles, Depth, Deep water, Maps.
Identifiers: USSR, Oozes.

A method of calculating the balance of reducing processes is proposed and applied to the profile made during the 46th voyage of the Soviet research vessel 'Vityaz' in 1969 and to the entire area of the Pacific Ocean. This profile, extending from Japan to the Hawaiian Islands, is about 2,000 km long and passes through volcanogenic-terrigenous deposits, hemipelagic deposits with inclusions of volcanogenic particles, and through red clays. Discussed are: (1) concept of the balance of reducing processes and methods of calculating and expressing it; (2) morphology of the reducing zone along the profile; (3) balance of reducing processes, and intensity of 'exchange of materials' between sediments and water; (4) general distribution of reducing processes and 'exchange of materials' in the Pacific; and (5) dynamics of reducing processes, and thickness of the active zone of sediments. (Josefson-USGS)

Litologiya i Poleznyye Iskopayemyye, No 4, p 50-54, July-August 1972. 4 fig, 2 tab, 23 ref.

Descriptors: *Geochemistry, *Sulfur, *Sediments, *Pacific Ocean, Sulfates, Hydrogen sulfide, Pyrite, Organic matter, Chemical reactions, Reduction (Chemical), Oxidation, Mud, Littoral.
Identifiers: USSR, Thiosulfates, Hydrotroilite.

Recent sediments in the littoral zone of the Pacific Ocean east of Japan exhibit an unusually high content of free hydrogen sulfide. Hydrogen sulfide formed by bacterial reduction of sulfates in mud waters gives a number of derivatives, among which pyrite predominates. The content of other derivatives of hydrogen sulfide, sulfide, and free sulfur is not more than 0.01%, and the organic sulfur content is less than 0.1%. As a result of reduction, sulfate content may drop to 0.03%. The capacity of sulfate reduction, assessed from the sum of all reduced forms of sulfur and derivatives of hydrogen sulfide, is a function of the organic content of sediments. The capacity of sediments to accumulate free hydrogen sulfide depends on the content of reactive forms of iron. Spatial distribution of reduced forms of sulfur in sediments is examined. (Josefson-USGS)
W73-13687

PATTERNS OF CHANGE IN CHEMICAL COMPOSITION OF IRON-MANGANESE CONCRETIONS IN SEDIMENTS OF THE NORTHWESTERN PART OF THE PACIFIC OCEAN (ZAKONOMERNOSTI IZMENENIYA KHIMICHESKOGO SOSTAVA ZHELEZO-MARGANTSEVYKH KONKRETSIY V OSADKAKH SEVERO-Z APADNOY CHASTI TIKHOGO OKEANA),
Akademiya Nauk SSSR, Moscow. Institut Okeanologii.

Litologiya i Poleznyye Iskopayemyye, No 4, p 40-49, July-August 1972. 4 fig, 5 tab, 21 ref.

Descriptors: *Geochemistry, *Iron, *Manganese, *Pacific Ocean, *Sediments, Clays, Mud, Metals, Trace elements, Chemical reactions, Deep water.
Identifiers: USSR, *Concretions, Vanadium, Zirconium, Tungsten.

Accumulation of iron-manganese concretions in sediments of the northwestern part of the Pacific Ocean was investigated during the 46th voyage of the Soviet research vessel 'Vityaz' along a traverse extending from the Tsugaru Strait to Wake Atoll. Intensification of the ore process in the direction of the pelagic region is expressed in an increase in ore material and a decrease in insoluble mineral residue of concretions in the area between the periphery and the center. Diagenetic redistribution of ore elements between enclosing muds and concretions, leading to enrichment of concretions, increases from the periphery towards the fine pelagic muds. With absolute enrichment in all ore elements except Cr, concretions are relatively enriched in Mn, Mo, Cu, Ni, Co, and W, and, correspondingly, deprived of Fe, Ti, V, and Zr between the periphery and the center. The factor determining the relationship between elements of the Fe and Mn groups in concretions is the ratio of the reactive forms of Fe and Mn in enclosing muds. (Josefson-USGS)
W73-13688

IRON AND MANGANESE FORMS IN SEDIMENTS OF THE NORTHWEST PACIFIC OCEAN (FORMY ZHELEZA I MARGANTSA V OSADKAKH SEVERO-ZAPADNOY CHASTI TIKHOGO OKEANA),
Akademiya Nauk SSSR, Moscow. Institut Okeanologii.
A. G. Rozanov, V. S. Sokolov, and I. I. Volkov.
Litologiya i Poleznyye Iskopayemyye, No 4, p 26-39, July-August 1972. 4 fig, 2 tab, 29 ref.

Descriptors: *Geochemistry, *Pacific ocean, *Iron, *Manganese, *Sediments, Clays, Diagenesis, Chemical reactions, Oxidation, Reduction (Chemical), Littoral, Deep water, Depth.
Identifiers: USSR.

Distribution of iron and manganese in sediments in the northwestern part of the Pacific Ocean was investigated in geochemical surveying performed during the 46th voyage of the Soviet research vessel 'Vityaz'. The marked increase in total iron content with distance from the coast occurs without a marked increase in reactive iron content. The presence of interlayers of volcanic or coarsely fragmental terrigenous material sharply increases the iron content of sediments. The manganese content increases toward the pelagic region of the ocean, with an accompanying increase in the degree of oxidation of sediments. Three types of sediments, differing in their content of iron and manganese forms, are distinguished: reduced, oxidized (red clays), and transitional. Total iron content changes little with depth. The content of reactive iron increases in reduced sediments and decreases in oxidized sediments. The manganese content of red clays increases in the direction of lower horizons. (Josefson-USGS)

RADIOACTIVITY OF CASPIAN SEA SEDIMENTS AND THEIR DEPOSITION RATE (RADIOAKTIVNOST' I SKOROST' OBRAZOVANIYA OSADKOV KASPIYSKOGO MORYA),
V. K. Pokidin, Yu. V. Kuznetsov, E. A. Prozorovich, and F. A. Asadullayeva.
Geokhimiya, No 7, p 834-843, July 1972. 7 fig, 2 tab, 21 ref.

Descriptors: *Geochemistry, *Sediments, *Deposition (Sediments), *Sedimentation rates, *Radioactivity, Radioisotopes, Uranium radioisotopes, Radium radioisotopes, Radiochemical analysis, Chemical precipitation, Oxidation-reduction potential, Calcium carbonate, Sea water, Deep water, Shallow water, Cores, Curves.
Identifiers: USSR, *Caspian Sea, Thorium, Ionium.

Deposition rates of deep-sea and shallow-water sediments in the Caspian Sea were determined by the radium-ionium age method from data on vertical distribution of Ra-226, Th-230 (ionium), Th-232, and U-238 in II sediment cores taken from different parts of the sea. Sedimentation rates for deep-sea and shallow-water sediments are 6.0-26.0 cm and 100 cm per 1,000 years, respectively. Vertical distribution curves for Th-230 and Th-232 in deep-sea deposits differ, strengthening the view that the two isotopes enter pelagic deposits in different forms. Authigenic precipitation of ionium plays an important role in its accumulation on the sea floor in deep-sea areas. There is a close correlation between distribution of Th-230 and calcium carbonate in deep-sea sediments, indicating that sorption of ionium on finely dispersed suspensions is a principal mechanism of its precipitation from sea water. (Josefson-USGS)

IRON SULFIDE CONCRETIONS IN BOTTOM SEDIMENTS OF LAKE BAYKAL (KONKRETSII SUL'FIDOV ZHELEZA V DONNYKH OSADKAKH BAYKALA),
Limnologicheskii Institut, Irkutsk (USSR).
G. S. Goldyrev.
Akademiya Nauk SSSR Doklady, Vol 202, No 6, p 1404-1406, 1972. 1 fig, 14 ref.

Descriptors: *Mineralogy, *Lake sediments, *Bottom sediments, *Iron, *Sulfides, Pyrite, Metals, Size.
Identifiers: USSR, *Lake Baykal, *Concretions, Pyrrhotite.

Iron sulfide concretions in Holocene sediments of Lake Baykal range in size from minute microglobules to spherical and other forms with a diameter of 5 mm or more. Flaky concretions often have an area of as much as 25 sq cm and a thickness of 2 mm. Microspheroids also vary in size from 0.005 mm to 0.08 mm in diameter. Spectral analysis of concretions reveals traces of cobalt, nickel, barium, and manganese in amounts ranging from 0.06% to 0.07%. There is a direct relationship between magnetism of concretions and their pyrrhotite content. (Josefson-USGS)

THE INFLUENCE OF SUSPENDED SEDIMENT ON THE SURFACE REAERATION OF UNIFORM STREAMS,
Mississippi Univ. School of Engineering.
C. V. Alonso, J. R. McHenry, and J-C. S. Hong.
Available from the National Technical Information Service as PB-223 011, $3.50 in paper copy, $1.45 in microfiche. Mississippi Water Resources Research Institute, State College, Completion Report, July 1973. 50 p, 15 fig, 2 tab, 35 ref, append. OWRR A-062-MISS (1).

Descriptors: Open channels, *Reaeration, *Sediments, *Diffusion, Aeration, *Suspended solids, *Turbulent flow, Laboratory tests, Mixing, Turbulence.

The surface reaeration of uniform streams, with and without sediments in suspension, has been studied in the laboratory. Based on the promise that the reaeration rate is controlled by an effective vertical diffusivity at the free surface and by turbulent mixing beneath it, an equation was developed to predict the reaeration rate of uniform clear water flows. The laboratory data gave support to the developed equation. This equation was then modified in order to account for the effect of suspended sediments on the surface reaeration of uniform sediment-laden streams. The new equation was substantiated by the experimental results, which indicate that the reaeration rate decreases as the average sediment concentration increases. The decrease was attributed to the dynamic influence of the suspended particles on the turbulent flow field.

Descriptors: *Geochemistry, *Boron, *Bottom sediments, *Clays, Illite, Sedimentary basin (Geologic), Salinity, Saline water, Inflow, Maps. Identifiers: USSR, *Sea of Azov, Black Sea, Kerch' Strait.

Boron in bottom sediments of the Sea of Azov was investigated for its relationship to basin salinity. The boron content of sediments clearly varies with the rate of inflow of waters from the Black Sea and with the erosion of terrigenous material. The boron content of new Euxinian sediments in the northern part of the sea varies between 0.007% and 0.01% and reaches 0.012% in the southern part. Relatively high boron concentrations occur in new Azov sediments in the middle part of the basin, while highest boron concentrations are found in sediments of the Kerch Strait through which waters from the Black Sea flow. STUDY OF THE QUALITY OF FORMATION WATERS FROM ELECTRIC LOGS IN THE SALT AREA, CALCUTTA,
Central Groundwater Board, Calcutta (India).
S. Das.
Indian Geohydrology (Calcutta), Vol 8, No 2, p 99-103, December 1972. 2 fig, 1 tab.

Descriptors: *Water quality, *Borehole geophysics, *Electrical well logging, Resistivity, Salinity, Bicarbonates, Chlorides.
Identifiers: *India (Calcutta).

Electric logs were recorded in the exploratory boreholes drilled in the Salt Lake area, Calcutta, India, to evaluate the quality of formation water in the deeper aquifers and its suitability for domestic uses in the proposed township around the Salt Lake. Salinity as determined by chemical analysis varies from 1200 to 1600 ppm, and compares well with the values determined from resistivity of formation waters. Since the groundwater in the area is chloride-bicarbonate type, the actual values of total dissolved solids were intermediate between those computed from electric logs for sodium chloride and bicarbonate types of water. (Knapp-USGS)

GEOCHEMISTRY OF THE GANGA RIVER WATER,
Geological Survey of India, Calcutta.
B. K. Handa.
Indian Geohydrology (Calcutta), Vol 8, No 2, p 71-78, December 1972. 8 tab, 5 ref.

Descriptors: *Water chemistry, *Rivers, *Dissolved solids, Bicarbonates, Carbonates, Calcium, Alkaline earth metals, Magnesium, Geochemistry.
Identifiers: *India, *Ganga River.

Ganga river water (India) is of the alkaline earth bicarbonate type. However, near Calcutta, the influx of tidal water changes its character radically. The total dissolved mineral content of the river water gradually increases with distance from the source up to Varanasi; but thereafter it tends to decrease. The nature and concentration of the dissolved mineral content also varies in different seasons. During the monsoons the total dissolved minerals are not only lower but the alkaline earths and the bicarbonate ions are also more predominant. On the average the Ganga River carries annually around 90 million tons of various ions to the sea, of which nearly 79 million tons are the alkaline earth bicarbonates. (Knapp-USGS)

Descriptors: *Sediment transport, *Inland waterways, *Erosion control, *Sediment control, Channels, Sedimentation, Estuaries, Salinity, Flocculation.

The need to control erosion and deposition in waterways prompted this investigation of the fundamental laws governing transport of fine cohesive sediment. Shoaling is particularly a problem in estuaries where high salinity results in the settling of flocculated sediments. Experiments were conducted using a special testing apparatus free of secondary currents. A law describing the rates of deposition has been derived. This law gives the deposited fraction of the depositable portion of the sediment as a logarithmic-normal function of time. Using a sediment continuity principle, it was further shown that the apparent settling velocities of the flocs also depend on the same parameters. Data on the deposition of sediments from the San Francisco Bay estuary indicates a good agreement with the results derived from measurements in the testing apparatus. (Woodard-USGS)

SEDIMENT TRANSPORT IN A TIDAL INLET,
Geological Survey, Menlo Park, Calif.
J. R. Ritter.
In: Proceedings of 13th Coastal Engineering Conference, July 10-14, 1972, Vancouver, B C, Canada: American Society of Civil Engineers, New York, N Y, p 823-842, 1972. 6 fig, 3 tab, 7 ref.

Descriptors: *Sediment transport, *Sedimentation, *Lagoons, *Coasts, *California, Sands Tidal effects, Inlets (Waterways), Pacific Ocean, Discharge (Water), Flow rates, Tides, Particle size, Sediment yield.
Identifiers: *Bolinas Lagoon (Calif).

Five series of measurements of the quantity of sediment being transported by tides into and out of Bolinas Lagoon, Calif., were made as part of a study to determine the rate of sediment depostion in the lagoon and to define the sources and movement of the sediment. Three series of measurements were made at the inlet, and two series of measurements were made in two channels inside the lagoon not far from the inlet. In all, the suspended-sediment discharge for seven ebbtides and six floodtides was determined. The measurements were made during periods when inflow to the lagoon from upland sources was negligible; therefore, the values of sediment discharge represent those caused chiefly by tidal action. The highest flows and suspended-sediment discharges occurred during the major daily ebbtide. Most transported sediment was sand. Computations from a relation of suspended-sediment discharge and tidal range indicated that the annual suspended-sediment discharge of ebbtides exceeded that of floodtides by 9,000 tons. The highest concentration of suspended sediment occurred near the east shore of the inlet which is at the end of a sand spit. (Woodard-USGS)

CHEMICAL AND PHYSICAL CHARACTERISTICS OF WATER IN ESTUARIES OF TEXAS, OCTOBER 1969-SEPTEMBER 1970,
Geological Survey, Austin, Tex.
D. C. Hahl, and K. W. Ratzlaff.
Texas Water Development Board Report 171, June 1973. 123 p, 13 fig, 65 tab, 7 ref.

Descriptors: *Water quality, *Chemical analysis, *Estuaries, *Texas, Physical properties, Sampling, Data collections, Analytical techniques, On-site investigations, Laboratory tests, Dissolved oxygen, Specific conductivity, Water temperature, Hydrogen ion concentration, Turbidity, Biochemical oxygen demand, Chemical oxygen demand, Insecticides, Herbicides, Inorganic compounds, Nutrients.

In September 1967 the U.S. Geological Survey, in cooperation with the Texas Water Development Board, began a water-resources investigation of the principal estuaries along the Texas coast. This report presents data collected during the 1970 water year and is the third in an annual series of basic-data reports. Approximately 300 data collection sites were visited. About 55% of these sites are located adjacent to or between navigation aids, bridge piers, power poles, survey platforms, well structures, or landmarks and can be reoccupied exactly. At each data collection site, field data are collected from several points along a vertical. Samples for laboratory analyses are collected from a predetermined number of data-collection sites and at other sites in the network when significant changes in field data indicate a need for additional samples. Properties of constituents measured in the field are dissolved oxygen, specific conductance, temperature, pH, and transparency by Secchi disk. Laboratory analyses include the principal inorganic ions, biochemical oxygen demand (BOD), chemical oxygen demand (COD), insecticides and herbicides, ammonia, nitrite, nitrate, orthophosphate and total phosphate, and several other selected ions such as bromide, iodide, strontium, lithium, boron, and iron. (Woodard-USGS)

CALIFORNIA COAST NEARSHORE PROCESSES STUDY, ERTS-A EXPERIMENT NO. 088,
Army Engineer District, San Francisco, Calif.
D. M. Pirie, and D. D. Steller.
Available from NTIS, Springfield, Va., 22151 as E73-10375 Price $4.00 printed copy; $1.45 microfiche. National Aeronautics and Space Administration Contract Report CR-131016, March 1973. 32 p, 17 fig, 5 ref.

Descriptors: *Sediment transport, *Coasts, *Estuaries, *Remote sensing, *California, Aerial photography, Satellites (Artificial), Photography, Sediment discharge, Photogrammetry, Ocean currents, Tidal effects.
Identifiers: San Francisco area, Monterey Bay, Santa Barbara Channel, Los Angeles area, Earth Resources Programs.

Techniques used for enhancing and analyzing nearshore processes from ERTS-A and aircraft data are described. Four California nearshore sites are used as test cells including the San Francisco area, Monterey Bay, Santa Barbara Channel, and the Los Angeles area. Techniques used for analyzing the test cells were direct photographic processing, computer compatible tape gain change enhancement, discrete point density analysis and plotting, and densitometer enhancement. By using these methods, it is possible to measure the seaward extent of the suspended sediment transport and to differentiate sediment levels within the individual sediment lobes. The movement of riverine discharged suspensates and coastal sediments by currents was an intricate part of the sediment transport analysis. The larger estuaries in the test cell areas were also studied for flushing characteristics. (Woodard-USGS)

THE FLUCTUATIONS IN COASTAL HYGROPHILOUS VEGETATION OF THE SOUTH CENTRAL PORTION OF THE BAY OF AUDIERNE,
Rennes Univ. (France). Faculte des Sciences.
J. Levasseur.
Bot Rhedonica Ser A. 10. p 251-292, 1971, Illus.
Identifiers: Agropyron-pungens, *Bay of Audierne, Coasts, Fluctuations, *France, *Hygrophilous vegetation, Juncus-maritimus, Phragmites-communis, Salinity, Schoenus-nigricans, Scirpus-pungens, Sensitivity.

Accidental modifications in the moisture and salinity conditions of a group of beach-side marshes determined a reorganization of the hygrophilous vegetation characterized by a qualitative loss in the flora and a reduction in the number of pre-existing elementary associations. Some of the very diverse reactions to modifications of the physical environment included weak competitive capacities of Scirpus pungens in relation to those of Scirpus maritimus, a sensitivity of Schoenus nigricans to medium and high salinities and great possibilities of extension of Juncus maritimus. Agropyron pungens and Phragmites communis.--Copyright 1973, Biological Abstracts, Inc.

FIRST REPORT ON A LEVEL PEAT BOG OF EASTERN TRENTINO (FIAVE), (IN ITALIAN),
Padua Univ. (Italy). Istituto di Biologia Anim.
G. Marcuzzi, G. Lorenzoni, and G. D. Doss.
Studi Trentini Sci Nat Sez B Biol, Vol 48, No 1, p 124-159, 1971, Illus.
Identifiers: Abies, Alnus, Alps, Betula, Bogs, Corylus, Fagus, Hypnaceae, Insects, *Italy, Oak, *Peat bogs, Phragmites, Physicochemical studies, Picea, Pinus, Plankton, Pollen, Salix, Sphagnum, Trophic states.

The Fiave bog occupies an ancient lake bed which was probably connected at one time with the glacial streams of the Lomaso basin. It covers about 0.5 km2, with its major axis running N to S. Soundings showed peat at a depth of 2.5 and 3.4 m containing sphagnum, Phragmites, Hypnaceae wood and gyttja; pollen analysis showed low levels of Salix, Betula, and Fagus, and somewhat higher levels of Alnus, Abies, Pinus, Picea, Corylus and mixed oaks. Every month of 1 yr the pH, O2 content and temperature of the water were checked and collections of flora and fauna were made from deep water, peripheral or littoral areas, superficial gyttja, deep peat, and the surrounding meadows. Many species of plankton, insects, flowering plants, and other types are listed. The bog in general is decidely oligotrophic, especially when compared to the Lagabrun bog in Val de Cembra, which is definitely eutrophic. Much more work needs to be done on the bogs of the Italian Alps, comparing physical and biotic factors and the relationship between them.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF RIVER OUTFLOW MANAGEMENT ON MARINE LIFE,
Fourah Bay Coll., Freetown (Sierra Leone). Inst. of Marine Biology and Oceanography.
A. A. Aleem.
Mar Biol (Berl). Vol 15, No 3, p 200-208. 1972, Illus.
Identifiers: Eel, *Egypt (Nile delta), *Fisheries, Management, Mugils, Outflow, Rivers, Sardinella, Shrimp, Marine life, *Aswan High Dam.

Construction of the Aswan High Dam in Egypt, and subsequent cessation (since 1965) of surplus Nile Flood water (ca 35 billion m3 of water annually) from discharging into the Mediterranean Sea, has had an impact on marine life in coastal waters adjoining the Nile Delta and on brackish-water life in the lakes. Nutrient concentrations have fallen considerably in these waters; phytoplankton blooms associated with the Nile Flood have disappeared and, consequently, Sardinella catches have dropped from ca 15,000 tons in 1964 to 4600 tons in 1965 and to 554 tons in 1966. Depletion of nutrients, reduction of organic matter and of mud and silt deposition, affect also benthic life on the Continental Shelf and in brackish-water lakes adjoining the sea. Lake fisheries have also suffered from reduction in potential area and obstruction of free connection with the sea, thus hindering spawning migrations of mugils, shrimp and eel. Marine erosion, of the Delta Coast has speeded-up following the Dam construction, due to loss of mud and loss of Lake-Sea currents. This can result in transgression of the sea on these lakes, and calls for urgent measures for shore protection. The benefits of the Dam to Egypt and Sudan in terms of agricultural expansion, hydroelectric power generated, industrialization and rehabilitation of populations are apparent.–Copyright 1973, Biological Abstracts, Inc.

OVERWINTERING PINK SHRIMP, PENAEUS DUORARUM, IN CORE AND PAMLICO SOUNDS, N.C.,
North Carolina Div. of Commercial and Sports Fisheries, Raleigh.
C. E. Purvis, and E. G. McCoy.
Available from NTIS, Springfield, Va. 22151 as COM-72-11069. Special Scientific Report No 22, April 1972. 29 p, 9 fig, 7 tab, 14 ref. NOAA Fed Aid Project 2-129-R.

Descriptors: *Pink shrimp, *Migration, *Growth stages, *Sounds, *North Carolina, Tagging, Marking techniques, Surveys, Data collections, Commercial shellfish, Cold resistance, Water temperature, Seasonal, Fish management.
Identifiers: *Pamlico Sound (NC), *Core Sound (NC).

Population dynamics information is presented for pink shrimp in the Pamlico-Core Sound areas of North Carolina. Pink shrimp (Penaeus duorarum) were marked with biological stains and fluorescent pigments and released. A total of 9,510 pink shrimp was released from September to November; 4,774 in Core Sound and 4,736 in Pamlico Sound. Of these, 947 (20%) were retrieved from Core Sound and 534 (11%) from Pamlico Sound. The modes of length-frequency distribution curves remained constant at 85-95 mm total length for Core Sound and at 95-105 mm total length in Pamlico Sound. The result from these mark-recapture experiments strongly indicate that migration of pink shrimp from Pamlico Sound to the ocean, from Pamlico Sound to Core Sound, and from Core Sound to the ocean does not occur in the fall to any appreciable degree. Mass migration, as well as significant growth, is brought to a halt by cooler water temperatures in the fall. Migration and growth resume in the spring when stimulated by rising water temperatures. Total mortality estimates reveal that the mean total reduction per week was 27.0% for the fall of 1970 and 29.5% for the spring of 1971 overwintering survivors. (Woodard-USGS)

TRANSPORT AND DEPOSITION OF SEDIMENTS IN ESTUARIES,
Geological Survey, Woods Hole, Mass.
R. H. Meade.
Geological Society of America, Memoir 133, p 91-120, 1972. 12 fig, 1 tab, 75 ref.

Descriptors: *Sediment transport, *Sedimentation, *Sediment distribution, *Estuaries, Particle size, Suspended solids, Tidal effects, Salinity, Flocculation, Density stratification, Reviews, Evaluation.
Identifiers: Shoaling.

The dynamic processes involved in the circulation of estuarine waters are probably the most important influences on the transport and deposition of sediments in estuaries. In moderately stratified or vertically homogeneous estuaries such as the Savannah (Georgia) and Thames (England) Rivers, sediments are moved progressively landward along the bottom and they accumulate near the limit of net landward flow. In highly stratified estuaries such as Southwest Pass of the Mississippi River, coarse sediments are trapped near the toe of the salt wedge while fine sediments are carried seaward over the salt wedge with the outflowing river water. On the basis of present information, however, distinctions cannot always be made between the results of natural dynamic processes and the results that are induced by the activities of man. Other possible influences on estuarine sedimentation are the inorganic and organic processes that tend to aggregate sedimentary particles, and the properties of the particles themselves. The effects of salt flocculation have been amply demonstrated by laboratory experiments, but no field evidence is available to show their importance in complex natural estuaries. The agglomeration of sediments by organisms likewise has been investigated in the laboratory, but its importance in nature needs to be evaluated. Knowledge of the composition and size distribution of the sediment particles contributed to estuaries from different sources is seriously deficient. (Woodard-USGS)

SOFT-SHELL CLAM POPULATION STUDY IN HAMPTON SEABROOK HARBOR, NEW HAMPSHIRE,
New Hampshire Fish and Game Dept. Concord.
W. C. Ayer.
Available from NTIS, Springfield, Va 22151 as COM-72-11180, Price $3.00 printed copy; $1.45 microfiche. Contract report to NOAA, May 1970. 39 p, 10 fig, 11 plate, 5 tab, 18 ref. NOAA 3-31-R.

Descriptors: *Clams, *Fish populations, *Growth stages, *Harbors, *New Hampshire, Environmental effects, Sediments, Dredging, Tidal effects, Surveys, Shellfish farming, Artificial substrates.
Identifiers: *Hampton Seabrook Harbor (N.H.).

Over the three years of the study in Hampton Seabrook Harbor, N. H., eight clam flats were surveyed with an alidade and square foot samples taken at pre-established locations. The estimated standing crop for the eight flats studied was 24,000 bushels. In addition to standing crop estimates, growth studies were conducted from which growth to a legal size of two inches was estimated at four years. Growth and clam densities varied in different substrates with combined sand and silt substrates providing optimal growth. A five-acre blue mussel bed was reclaimed with dredged sand in 1965. In the three years that followed, young clams were successful in setting and growing in the artificial substrate after compaction of sediments occurred from wind and tidal action. Newly set clams, however, were in direct competition with corresponding sets of blue mussels. (Woodard-USGS)

SOME CURRENT PROBLEMS OF RAIN STIMULATION RESEARCH,
California Univ., Berkeley. Statistical Lab.
J. Neyman, and E. L. Scott.
In: Proceedings (Vol. III), International Symposium on Uncertainties in Hydrologic and Water Resource Systems, University of Arizona, Tucson, December 11-14, 1972. p 1167-1221, (1972). 8 fig, 7 tab, 26 ref, 1 append.

Descriptors: *Weather modification, *Rainfall, *Experiments, *Arizona, Canada, Cloud seeding, Precipitation, Hydrology, Atmosphere, Data collections, Digital computers.
Identifiers: *Rain stimulation, Switzerland, Wind direction.

Particular problems in rain stimulation studies which have international implications and appear of paramount importance are discussed. The overall general rain stimulation problem is the necessity to understand the mechanisms of the phenomena which go on in the atmosphere when an effort is made to stimulate rain. Knowledge of these 'facts' is vital and digital computers are used continuously in search of such facts. However, fruitful computer modeling in actual experimentation with weather control must be preceded by consideration of two problems: (1) The establishment of what the hard facts are or were in specified circumstances, which in turn requires (2) thought of how the hard facts relating to weather modification can be established. The only source of reliable information on weather control is well-designed randomized experiments (particularly cloud-seeding). Some details of the March 1972 Skywater Conference VII are discussed, and the results of two notable experiments are recounted, one having taken place in Switzerland and the other in Arizona. DYNAMICS OF FREE AMINO ACID CONTENT IN MAIZE PLANTS IN CONNECTION WITH SOIL WATER REGIME (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Institut Fiziologii Rastenii i Agrokhimii.
S. I. Slukhai, and O. E. Shvedova.
Fiziol Biokhim Kul't Rast, Vol 4, No 2, p 151-156, 1972, Illus, English summary.
Identifiers: *Amino-Acids, *Maize plants, *Soil water regime.

During the vegetation period the content of free amino acids in maize leaves with a soil water deficit was higher than with a normal water supply. This indicates an increase in the content of NH4 + entering the reactions of direct amination with organic acids as well as a decrease in protein synthesis. Under conditions of water-supply deficit an increase in the content of asparagine, aspartic and glutamic acids, serine, glycine and alanine in leaves was observed.--Copyright 1973, Biological Abstracts, Inc.

INFILTRATION ANALYSIS AND ITS APPLICATION ON IRRIGATION DESIGN IN THE INFERIOR VALLEY OF COLORADO RIVER (IN SPANISH),
Universidad Nacional del Sur, Bahia Blanca (Argentina).
P. C. Fernandez, J. A. Luque, and J. D. Paoloni.
Rev Invest Agropecu Ser 3 Clima Suelo, Vol 8, No 1, p 1-29, 1971, English summary.
Identifiers: *Argentina (Colorado River), Equations, *Infiltration, *Irrigation design, River.

A theoretical analysis of the nonlinear partial differential equation governing the infiltration of water into soil is used in order to describe the soil and water parameters that influence the process. Because numerical solutions of this partial differential equation are possible only under assumptions which are remote from the real situation, the use of the well-known empirical equation of Kostiakov is recommended for use in irrigation design. A detailed description of the practical application of the Kostiakov equation is shown with the use of field data. A graphic solution of the basic intake rate equation is presented for practical purposes and recommendations in relation with the use of the infiltration equations in irrigation design are formulated.--Copyright 1973, Biological Abstracts, Inc.

INFILTRATION CHARACTERISTICS OF FURROW IRRIGATION IN A HEAVY-TEXTURED SOIL,
Agricultural Univ., Wageningen (Netherlands). Afdeling Weg- en Waterbouwkunde.
C. J. Grassi.
Meded Landbouwhogesch Wageningen. Vol 72, No 7, p 1-127. 1972. Illus.
Identifiers: Flow, *Furrow irrigation, *Infiltration, Irrigation, Moisture, Soils (Textured).

The rate and pattern of infiltration of soil water, under the conditions of heavy texture and shallow depth in a tropical furrow-irrigated soil, was studied. Three series of experiments were set out: 1st series with variable inflow and surface roughness; 2nd series with variable initial soil moisture content; 3rd series with variable furrow length. Five irrigations were applied during the period, Jan.-March, 1970. Subsequently in the 1st series of experiments, 1st, 3rd and 4th irrigations for 3 roughness conditions and 4 sizes of flow were tested. The 2nd irrigation was used for the 2nd series of experiments. The 5th irrigation served for the 3rd series of experiments. The following measurements were taken: rate of advance of the water front (distance x in m at time t in min); furrow section parameters (top width T and depth h); furrow inflow Q and outflow Q out; the simultaneous inflow and outflow. Advance and infiltration functions are obtained for the period of advance of the water front (first stage), and infiltration functions for the period of wetting the root zone (second stage). Water losses by deep percolation and by run-off at the end of the run were analyzed on the basis of the equations found. Data analysis showed that infiltration is a very variable factor affected by the conditions of the soil and the surface of the channel bed, as well as by the size of the flow, furrow length and stage of irrigation. Soil cracking upon drying was a relevant factor in the entry of water into the soil.--Copyright 1973, Biological Abstracts, Inc.

PLANT-SOIL RELATIONS,
Universidad Nacional de Colombia, Palmira. Facultad de Agronomia.
J. A. Gomez.
Acta Agron (Palmira). Vol 21, No 3, p 141-143. 1971.
Identifiers: Earthworms, Fertilizers, Irrigation, Microorganisms, Pests, Soils, Weeds, *Plant-soil relationships, Crops.

Soil is not strictly necessary for plant production as is shown by hydroponics, and even poor soils can be made to produce excellent crops by the use of advanced techniques. In underdeveloped countries there are large areas where the soil is poor, but where the population nevertheless depends on it to produce crops of some sort. With advances in development, the productivity of the soil can be greatly increased by fertilizers, irrigation, drainage, pest and weed control, etc. It is possible to dispense with many of these artificial aids by employing earthworms and certain microorganisms to improve the structure and nutrient content of the soil.--Copyright 1973, Biological Abstracts, Inc.

YIELD OF FLUE-CURED TOBACCO AND LEVELS OF SOIL OXYGEN IN LYSIMETERS WITH DIFFERENT WATER TABLE DEPTHS,
Agricultural Research Service, Florence, S.C. Soil and Water Conservation Research Div.
R. B. Campbell, and G. T. Seaborn.
Agron J Vol 64, No 6, p 730-733. 1972. Illus.
Identifiers: Alkaloids, *Carbon dioxide, Growth, Lysimeters, Nicotiana-Tabacum, *Oxygen, Root, Shoot, *Soil aeration, Sugars, *Tobacco yield, Water tables.

Flue-cured tobacco (Nicotiana tabacum L.) was grown in lysimeters with static water-table levels at 30, 45, 60 and 90 cm below the soil surface to more clearly define the level at which a favorable balance between soil aeration and water supply is attained. The O2 and CO2 content of the soil air was determined periodically at various depths. Water-table treatment effects were evaluated in terms of root and shoot growth, yield and quality of tobacco. Dry leaf yields for the 90-, 60- and 45-cm water-table treatments were all significantly (P greater than or equal to 0.05) greater than that for the 30-cm treatment. Yields for the 60- and 90-cm water-table levels were larger, but not significantly (P greater than or equal to 0.05) larger than the 45-cm treatment. The yield difference between the 60- and 90-cm treatments was not significant (P greater than or equal to 0.05). Roots of tobacco recovered from soil above the 60- and 90-cm water tables weighed only 10% more than roots recovered from soil above the 30-cm water table. Average CO2 and O2 gradients in the soil above the water table were nearly equal but of opposite sign. Soil environmental conditions imposed by the 60-cm water-table treatment provided the most favorable balance between aeration and water supply for tobacco.--Copyright 1973, Biological Abstracts, Inc.

ROOTPLOWING AND SEEDING ARID RANGELANDS IN THE SOUTHWEST,
Agricultural Research Service, Las Cruces, N. Mex. Jornada Experimental Range.
C. H. Herbel, G. H. Abernathy, C. C. Yarbrough, and D. K. Gardner.
Journal of Range Management, Vol 26, No 3, p 193-197, May 1973. 3 tab, 3 fig, 2 ref.

Descriptors: *Seeds, *Planting management, *Soil-water-plant relationships, *Soil properties, *Southwest U.S., New Mexico, Arid lands, Ranges, Plant growth, *Vegetation establishment, Range grasses, Grama grasses, Desert plants, Range management, Forage grasses.
Identifiers: Lehmann lovegrass, Boer lovegrass, Black grama, Sideoats grama, Yellow bluestem, Blue panic, Fourwing saltbush, Alkali sacaton.

Past grazing abuses, droughts, and brush encroachment have contributed to severe depletion of desirable vegetation on some arid rangelands in the Southwest, where seeding desirable species now affords the only hope of recovery. But the establishment of seeded species in arid regions is difficult. In this study, 23 plots were seeded across southern New Mexico from 1966 to 1970 with experimental seeding equipment. The equipment was developed for rootplowing and seeding brush-infected range, such as creosotebush or tarbush, in one pass over the land. With such treatment good to excellent stands were obtained on 10 plots while 4 had only fair stands. Many of the seeding failures were related to site conditions with erosive, droughty, or heavily crusted soils. On the sandy and loamy creosotebush sites seeding was most easily established with Lehmann and Boer lovegrass, black and sideoats grama, yellow bluestem, blue panic, and fourwing saltbush. Sideoats grama, yellow bluestem, and alkali sacaton were the best ecotypes for the heavier tarbush soils. The exact seed mixture for any site depends on the objectives of management. (Gloyd-Arizona)

STRESS METABOLISM. I: NITROGEN METABOLISM AND GROWTH IN THE BARLEY PLANT DURING WATER STRESS,
Waite Agricultural Research Inst., Glen Osmond (Australia).
T. N. Singh, L. G. Paleg, and D. Aspinall.
Australian Journal of Biological Sciences, Vol 26, No 1, p 45-56, Feb. 1973. 9 fig, 1 tab, 25 ref.

Descriptors: *Plant growth, *Plant physiology, *Nitrogen, *Metabolism, *Amino acids, Barley, Seeds, Roots, Moisture stress, Proteins, Crop response, Leaves.
Identifiers: Proline content, Stress metabolism.

An induced water deficit in 10-day barley seedlings resulted in a decrease in leaf dry weight within a 28-hour period, although shoots and roots continued to increase in weight. Results showed that primordium formation and apex elongation on the main shoot were inhibited, but floral development at the apex continued. These effects were accompanied by a marked increase in the free proline content of all plant organs, the rate of accumulation being greatest in the leaf laminae. Variations in the amounts of other free amino acids in the leaves, particularly aspartate and glutamate, with the onset of water stress were considerably less than that of proline. Accumulated proline was metabolized rapidly once the tissue water deficit was relieved. Soluble protein content of leaves and roots continued to increase for some 20 hours after water stress was imposed, but eventually fell. Net protein synthesis was rapidly resumed once the water stress was relieved. The amount of proline associated with trichloroacetic acid-precipitable protein fraction increased during water stress and fell to the control level upon rewatering. If roots were aerated, accumulation of free proline in the roots was inhibited. In these circumstances, the proline content of the shoot was increased such that the total amount of free proline in the whole plant was unaffected by root aeration. (Bahre-Arizona)

ARIZONA AGRI-FILE.

Arizona University, Tucson, Cooperative Extension Service, 1973. 15 sheets.

Descriptors: *Arizona, *Agriculture, *Statistics, *Crop production, *Livestock, Vegetable crops, Fruit crops, Cotton, Government supports, Farm prices.

A series of statistical sheets on each of Arizona's 14 counties, together with a State summary, covers in capsule form pertinent information on the geography and agriculture of each, giving percentage of land area in Federal, State, private, and Indian reservation holdings, physiography, and climate. Agricultural information covers statistics on crops, both field and vegetables/melons, including acreage, yield per harvested acre, and production; citrus, deciduous fruit, and pecans; cash receipts from farm marketings; livestock on farms; government payments; and livestock production and marketings, each category showing comparative figures for 1970, 1971, and 1972. The State summary gives totals for the same categories, with some examples showing 899,000 cattle marketed from feedlots in 1972; 25,658 acres in oranges in 1973; 466 bales of upland cotton produced on 241,000 acres in 1971; cash receipts from marketing of Arizona's agricultural products, $786 million in 1972, up 7 percent from 1971. EFFECT OF WILTING AND SOIL DROUGHT ON ENDOGENOUS GROWTH REGULATORS OF MESOPHYTE PLANTS, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Inst. of Plant Physiology.
T. N. Pustovoitova.
Fiziol Rast. Vol 19, No 3, p 622-628. 1972, Illus. (English summary),
Identifiers: Abscisic-Acid, Apricot, Bean, Castor-Oil, *Drought, Endogenous growth, Hemp, *Mesophyte plants, Plant regulators, Soils, Wheat, *Wilting, Dehydration.

The dehydration of intact young plants of bean and wheat, of cut leaves of castor-oil plants and hemp as well as the effect of soil drought on one-year-old apricot seedlings resulted in the formation of inhibitors in the leaves of these plants and in the decreased activity of growth stimulants. The accumulation of growth inhibitors in the leaves was detected during slight dehydration. The process does not depend on the type of metabolism or the phase of plant growth. Growth inhibitors formed during wilting are phenol compounds and abscisic acid. The impaired growth of the mesophytic plants is due to the decrease of phytohormone content and to the accumulation of growth inhibitors.--Copyright 1973, Biological Abstracts, Inc.

IRRIGATION RATES AND WATER LOSSES DURING IRRIGATION (POLIVNAYA NORMA I POTERI VODY PRI OROSHENII),
A. P. Aver'yanov.
Pochvovedeniye, No 9, p 95-100, September 1972. 3 tab, 19 ref.

Descriptors: *Land reclamation, *Irrigation practices, *Rates of application, *Water loss, Irrigation systems, Irrigation water, Evaporation, Transpiration, Soil groups, Soil moisture, Moisture content, Field capacity, Bulk density, Wheat, Growth stages, Equations.
Identifiers: USSR.

A method is described for computing net and gross irrigation rates. The net irrigation rate is determined from the water volume needed to bring the moisture content of the active layer of soil to maximum field-moisture capacity, and a coefficient is introduced to account for the amount of water penetrating and filtering through this layer. The gross irrigation rate is determined by introducing a coefficient which allows for water loss through evaporation during irrigation and soil-moisture redistribution. Comparisons are made of computed and actual gross irrigation rates for irrigation of wheat in the Kuybyshev, Saratov, and Volgograd Oblasts in Middle and Lower Volga regions. (Josefson-USGS)

URBAN STORM DRAINAGE AND FLOOD CONTROL IN THE DENVER REGION--FINAL REPORT.
Denver Regional Council of Governments, Colo.

Available from NTIS , Springfield, Va. 22151 as PB-218 962 Price $3.00 printed copy; $1.45 microfiche. Denver Urban Drainage and Flood Control District, Project REUSE Final Report DRCOG-72-008, August 1972. 220 p, 25 fig, 40 tab.

Descriptors: *Urban runoff, *Urban hydrology, *Comprensive planning, *Storm drains, Flood control, *Colorado, Water management (Applied), Social aspects, Legal aspects, Planning, Storm runoff, Sewers.
Identifiers: *Denver (Colo).

A proposed 20-year (1971-1990) regional program is presented for major drainage in the Denver region. A regional perspective, the urban system concept, description of the existing major drainage system, management responsibilities, criteria, assumptions and uncertainties, the four alternative concepts developed for consideration, and an evaluation of those concepts are also given. The program includes proposed short-range activities for 1971-1975, and a long-range program to achieve 100-year frequency storm protection throughout the region by 1990, including preventive measures, facility construction, and flood insurance. This report is one of a series, related to urban drainage and flood control, resulting from Project REUSE (Renewing the Environment

through Urban Systems Engineering). (Knapp-USGS)

STORM DRAINAGE PLAN STUDY DESIGN.
Central New York Regional Planning and Development Board, Syracuse.

Available from NTIS, Springfield, Va., 22151, PB-218 385 Price $3.00 printed copy; $1.45 microfiche. November 1972. 15 p. HUD 246-04.

Descriptors: *Urban runoff, *Storm runoff, *Storm drains, *Flood control, *Planning, Legislation, Urban hydrology, New York, Water management (Applied).

The nature and scope of a storm drainage and flood protection plan are described, identifying what information is needed, what studies should be made, and what results should be sought by its formulation. Planning methodology to be followed is outlined and the inventories which must be made, consisting of those for soils and geologic data, demographic and land use data, hydrologic data, and administrative and regulatory data are described. Initial plan and program formulation is described, including the designation of optional storm drainage and flood control policies and their subsequent review. Necessary implementation steps are also outlined. (Knapp-USGS)

CONDITIONAL CHANCE-CONSTRAINED MODEL FOR RESERVOIR CONTROL,
London Graduate School of Business Studies (England). Dept. of Operations Research and Statistics.
M. Lane.
Water Resources Research, Vol 9, No 4, p 937-948, August 1973. 2 fig, 3 tab, 15 ref.

Descriptors: *Reservoir releases, Management, Agriculture, *Benefits, *Irrigation water, *Stochastic processes, *Linear programming, Decision making, Rainfall, Flows, Hydrology, Demand, Optimization, Mathematical models, Systems analysis, Risks.
Identifiers: *Chance-constrained programming, *Control policies, Cropping patterns.

The problem of reservoir management is to control flows from the reservoir so that the possibly conflicting demands for flood protection, recreation, hydroelectric power, irrigation, or urban demand are best satisfied. To achieve this, account must be taken of the random nature of flows entering the reservoir, and the control policies must be designed to cover a wide range of possible occurrences. A model for designing the optimum control policies of a reservoir serving an agricultural area is presented. Policies are designed to maximize the expected agricultural benefits to the area. The demand for irrigation water depends on both the crops planted and the rainfall in the area. Explicit account is taken of both, particularly the stochastic nature of the rainfall, which is characterized as a joint log normally distributed random variable. The problem lends itself to a conditional chance-constrained formulation. However, the dependency of the rainfall distributions and agricultural functions does not lead to conveniently solvable deterministic equivalents. As a result, decision rules are defined for each of a series of sequences of rainfall intervals. The problem then reduces to a linear programming form. The novelty of the approach lies in the fact that the decision rules are conditional rules whose parameters depend on previous observations of the random variable. (Bell-Cornell)

Identifiers: *Washington (D.C.).

A computer simulation of the Potomac River basin system run under conditions projected for the year 2010 has been utilized to analyze the performance of three water supply systems proposed as alternatives to meet the Washington, D.C., metropolitan area's demand for water. Two of the systems offered additional storage capacity on the Potomac; these systems were found to meet average daily water withdrawal requirements. A third system, a minimum storage plan, offered no new storage capacity but was found feasible if used in conjunction with pumping from the Potomac River estuary and/or accepting drought adjustment. The minimum storage plan was the least costly system in real terms. However, the most costly reservoir systems are favored by local water planners because most of the reservoir costs would be shared by the federal government. Although the real costs of the minimum storage plan are less than those of the reservoir plans, it is not favored, because none of the costs are borne by the federal government. This study illustrates the inefficiencies that can be generated by current cost-sharing policies. (Bell-Cornell)

THE FOREST-BOG COMPLEX OF SOUTHEAST ALASKA,
Alaska Univ., College. Dept. of Biological Sciences.
B. J. Neiland.
Vegetatio, Vol 22, No 1-3, p 1-64, 1971, Illus, Map.
Identifiers: *Alaska, *Bogs, Chamaecyparis-nootkatensis-G, Drainage, *Forest-bog complex, Lichens, Liverworts, Mosses, Picea-sitchensis-G, Pinus-contorta-G, Shrubs, Slope, Thuja-plicata-G, Tsuga-heterophylla-G, Tsuga-mertensiana-G.

Major vegetational, environmental, and past accumulation patterns were studied. Three levels of vegetational pattern are: a community type level, (forest, bog and intermediate types); a community level, (major variations within forest, bog and, the intermediate community types); and a subcommunity level, (major patterns of the forest understory and the bog surfaces). Both extensive survey and intensive sampling were carried out in a widespread array of sites. Average density, basal area and frequency of trees are given as relative values and summarized for an importance index. A summary table lists the species found and their frequencies. Dominance homogeneity was used to select stands. The 3 community types blended into one another in a continually varying pattern which, on a gross scale, conformed primarily to surface topography. Forests occurred chiefly on the steep mountain slopes, bogs on land of gentle repose, with intermediate communities on slopes in between these. That the correspondence was with drainage, was shown by forest presence on land of little slope if it were near the ocean or large drainages, or on deep porous substrates, and by bog presence on steep slopes if any local conditions prevented runoff from being rapid the full length of the watershed. Species patterns included dominance of the upland forests by Tsuga heterophylla and Picea sitchensis, with Chamaecyparis nootkatensis, Thuja plicata, and Tsuga mertensiana of local importance.--Copyright 1972, Biological Abstracts, Inc.

A MODEL WATER CODE, WITH COMMENTARY,
Spessard L. Holland Law Center, Gainesville, Fla.
F. E. Maloney, R. C. Ausness, and J. S. Morris.
University of Florida Press, Gainesville, 1972, 373 p, append. $25.00. OWRR A-009-FLA (5).

Descriptors: *Water law, *Legislation, *State jurisdiction, *Regulation, Weather modification, Administration, Consumptive use, Riparian rights, Prior appropriation, Water permits, State governments, Water resources development, Hydrologic cycle, Reservoirs, Sewerage, Reasonable use, Waste treatment, Well permits, Water quality control, Legal aspects, Well regulations, Judicial decisions, Water rights.
Identifiers: *Model code, Injunctive relief.

A model is presented for the development of a comprehensive regulatory program in eastern states. This program is designed with three purposes: to take into account the hydrologic interrelationship of all types of water resources in the state; to provide greater certainty than is possible under a court-administered reasonable use approach; yet to retain sufficient flexibility to make possible realistic long-range plans for the conservation and wide use of water resources and the elimination of waste. This last goal is to be accomplished through administrative regulation utilizing the best parts of riparian and appropriation systems. Six chapters of text and commentary discuss: administrative structure and operation; regulation of consumptive uses; construction, operation and regulation of water wells and surface water works; protection of water quality; and weather modifics. An extensive index and a table of cases cited follow the commentary. (Dunham-Florida)

BOOMER CREEK CHANNEL IMPROVEMENT (LOCAL FLOOD PROTECTION PROJECT), STILLWATER, OKLAHOMA, (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, Tulsa, Okla.

Available from National Technical Information Service, U.S. Dept. of Commerce, as EIS-OK-72-5337-F. $4.75 in paper copy, $1.45 in microfiche. May 1972. 39 p, 1 map, 4 tab.

Descriptors: *Oklahoma, *Environmental effects, *Flood control, Water control, Flood routing, Alternative planning, Estimated benefits.
Identifiers: *Environmental Impact Statements, Stillwater (Okla).

The channelization of West Boomer and Boomer Creeks through the city of Stillwater, Oklahoma is proposed. The project will result in flood control benefits and some overall social and aesthetic environmental improvment due to lessening of flood damage. The project will require construction of one new highway bridge, a new railroad bridge, several new culverts, footbridges and drop structures. Some public and private utility, pipelines, sewers, powerlines and telephone lines will be removed, altered or relocated. Some of the construction involved will leave scars but fish and wildlife in the area are thought not to be significantly affected by the project. Alternatives included a reservoir, levees, nonstructural measures, and no development. Appropriate comments were received and included. (Wadley-Florida)

OPTIMIZING THE SUPPLY OF INLAND WATER TRANSPORT,
Peat, Marwick, Mitchell and Co., Washington, D.C.
J. F. Hoffmeister, III, and R. de Neufville.
Journal of the Waterways Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol 99, No WW3, Proceedings paper No. 9926, p 293-308, August 1973. 12 fig, 1 tab, 9 ref, 2 append.

Descriptors: *Inland waterways, *Transportation, *Supply, *Optimization, Design, Prices, Lakes, Navigation, Rivers, Barges, Constraints, Currents (Water), Equations, Mathematical models, Systems analysis.
Identifiers: *Economic analysis, *Production management, Towed bodies.

A supply model for inland water transport is explored. The model is a technologic production function valid for all circumstances. It is used, in combination with information about relative prices, to determine optimal configurations of tows. It is concluded that: (1) The production function has diminishing marginal returns; (2) it has increasing returns to scale for lakes, but generally decreasing returns to scale for rivers, which implies that whereas it is desirable to build as large as possible for lake (or ocean) transport, there is a definite optimal size for any given river; and (3) fixed guidelines, in terms of horsepower/ton ratios, can be developed for lakes and other environments where currents are negligible, but are generally impossible to determine for river navigation. The optimal design guidelines depend upon relative prices of materials and wages. Total costs are relatively insensitive to additional horsepower beyond that required for the most economical design. (Bell-Cornell)

MARGINAL ECONOMICS APPLIED TO PIPELINE DESIGN,
Toltz, King, Duvall, Anderson and Associates, St. Paul, Minn.
J. M. Osborne, and L. D. James.
Transportation Engineering Journal of American Society of Civil Engineers, Vol 99, No TE3, p 637-653, Proceedings paper No. 9933, August 1973. 5 tab, 18 ref, 2 append.

Descriptors: *Water conveyance, *Economics, *Marginal benefits, *Pipelines, *Design, *Optimization, Costs, Systems analysis, Mathematical models.
Identifiers: Economic surveys, Computations, Sensitivity analysis.

A noncomputer shortcut to the total cost method is developed from marginal economic theory. Marginal economics is a microeconomic tool, created to help find an optimum design; it is based on incremental costs and benefits, stating that additional cost increments should be expended until the incremental benefit realized diminishes to the value of the cost. Marginal economic theory, couples with basic power and headloss relationships, is used to derive an equation which aids in the formulation of optimal pipeline design; examples are included of a few basic situations for water conveyance systems. The examples indicate how the equation can be used and modified to fit design-imposed constraints. An economic design must be sensitive to interest rates, labor rates, and material costs; it should reflect choice of the type of power supply and be dependent on power cost, and it should provide the optimum blend of payments, operation expenses, and maintenance costs. The method developed fulfills all these requirements, saves time and effort, and fits all types of piping problems. Demonstrated is the derivation of a marginal economic relationship applicable to piping problems and the means of organizing piping cost components to allow differentiating between costs and benefits. EFFICIENCY OF WATER USE AND ASSOCIATED CHARACTERISTICS OF LEHMANN LOVEGRASS,
Agricultural Research Service, Tucson, Ariz. Plant Science Research Div.
L. N. Wright, and A. K. Dobrenz.
Journal of Range Management, Vol 26, No 3, p 210-212, May 1973. 1 tab, 11 ref.

Descriptors: *Water utilization, *Consumptive use, *Range grasses, *Vegetation establishment, Plant growth, Productivity, Deserts, Grasslands, Laboratory tests, Soil-water-plant relationships, Efficiencies, Drought tolerance, Stomata density, Transpiration deflection, *Southwest U.S.
Identifiers: *Lehmann lovegrass, Plant waxes.

For 35 years on desert grasslands in the Southwest Lehmann lovegrass has shown its capability of acceptable seedling establishment as a rangeland grass. This study was designed to investigate its efficiency of water use, the relationship of seedling drought tolerance to that water use, and the association of transpired water, dry matter production, stomatal density and plant waxes with these factors. Results indicate that the components of efficient water use and the values of water-use efficiency varied among Lehmann lovegrass lines, with Line L-38 being the most efficient in water use, having the highest percentage of seedling drought tolerance, and producing the most dry matter. High deflection values from plant waxes were associated with high efficiency of water use and a high percentage of survival. While stomatal density was shown to be different among the Lehmann lovegrass lines, being higher on the upper surface than on the lower surface of the leaf blade, it did not seem to be associated significantly with either efficient water use or seedling drought tolerance. PERIWINKLE CREEK RC AND D PROJECT MEASURE, UPPER WILLAMETTE RC AND D PROJECT, OREGON (FINAL ENVIRONMENTAL STATEMENT).
Soil Conservation Service, Washington, D.C.

Available from NTIS, Springfield, Va. 22151 as EIS-OR-73-0062-F - Price $3.00 printed copy; $1.45 microfiche. Report USDA-SCS-ES (ADM)-73-RD-2 (F), January 1973. 42 p, 3 append.

Descriptors: *Environmental control, *Flood control, *Watershed management, *Oregon, *Conservation, Sediment control, Erosion control, Water pollution control, Fish conservation, Land use, Public health, Recreation facilities, Economics, Planning, Reviews, Evaluation.
Identifiers: Periwinkle Creek (Ore), Linn County (Ore), *Environmental Impact Statements.

This environmental statement concerns community improvements covered by resource conservation and development measure plan which would reduce streambank erosion, sediment deposition, flood damage, drainage problems, water pollution, fish loss by stranding, public health problems, and development encroachment on good farm lands in Periwinkle Creek, Linn County, Oregon. The measure will improve the tax base and pattern of suburban development and increase facilities for public waterbased recreation, employment, personal income, land values, and general business activity. The planned works of improvement include land treatment supplemented by 13,200 feet of floodway, 17,100 feet of open channels, two ponds, and facilities for waterbased recreation in two community parks. Complex use of water resources is examined in this collection of 150 abstracts of data of investigations conducted in 1968-69 by scientific institutes of the USSR Academy of Sciences, academies of the Union Republics, and other establishments and institutions of higher learning in the USSR. The abstracts are grouped under five subject headings: (1) study of water requirements of different branches of the national economy (23 abstracts); (2) study of quantitative and qualitative aspects of water resources (44 abstracts); (3) principles of quantitative redistribution and qualitative transformation of water resources (52 abstracts); (4) study of movement of water masses and their interaction with the environment (20 abstracts); and (5) methods of planning for water-resources complex use (11 abstracts). Some of the uncertainty associated with forecas ing future water demands and with estimatin water supply available for regional proje development can be reduced by investing in dat collection programs. A water resources informa tion system seeks to provide planners with a suff cient amount of data to minimize the expected op portunity loss. The questions asked are: Wha kinds of data should be collected. When shoul they be collected; how much should be spent t reduce the uncertainty in the water resourc planning process. Since the true values of th model parameters are uncertain, statistica methods are necessary to determine the relativ importance of each parameter to the plannin process. Presented is a planning model which pr vides the vehicle for developing a preliminar design for a data-collection network. The mod utilizes mixed-integer programming to identify minimum-cost set of water resources projects an to determine the sequence of their constructio The model has parameters related to the expecte values of hydrologic and economic factors, an the optimum design's sensitivity to variations i these factors establishes the shape of an opport nity-loss surface, e.g., the difference between th values of the objective function using 'tru parameter values and the estimated paramet values. Journal of Range Management, Vol 26, No 4, p 253-256, July 1973. 6 fig, 4 ref.

Descriptors: *Water wells, *Water supply development, Ranges, Water supply, Water loss, Hydrogeology, *Arizona, Wells, *Well casings, Drilling, Construction, *Construction costs, Maintenance costs.
Identifiers: *Horizontal wells, San Carlos Apache Indian Reservation.

Horizontal wells, a recent addition to range water development, have a number of advantages over other more conventional range water supply systems, providing a minimum loss of water, a sanitary water supply, lower construction and maintenance costs, and more opportunities for developing a successful water supply. Favorable geological formations for their development exist throughout a substantial area of the better rangeland in Arizona and the mountain states. The construction of 45 horizontal wells on the San Carlos Apache Indian Reservation during 1967-1969 is described, including site selection, drilling equipment, and the construction process. A horizontal well is defined as a horizontally-cased well in a water-bearing formation. (Gloyd-Arizona)

CATALOG OF RECHARGE BASINS ON LONG ISLAND, NEW YORK, IN 1969,
Geological Survey, Mineola, N.Y.
G. E. Seaburn, and D. A. Aronson.
New York State Department of Environmental Conserv ation Bulletin 70, 1973. 80 p, 2 fig, 10 tab, 10 ref.

Descriptors: *Groundwater recharge, *Artificial recharge, *Water storage, *New York, Methodology, Storm runoff, Diversion, Hydrologic data, Reviews, Water supply, Sites.
Identifiers: *Long Island (NY).

Basic data are compiled for 2,124 recharge basins in operation in 1969 on Long Island, New York. Data consist of basin location, date of construction, capacity to store water, maximum infiltration area, size, bottom altitude, overflow altitude, land-surface altitude, water-table altitude, drainage area, clogging or lack of clogging, use, geologic environment, and soil environment. Tables summarizing much of the data and a cross reference are included. One of the major methods of disposing of storm runoff from urban and suburban areas on Long Island, New York, is to divert the water into recharge basins. This method of disposal, begun in 1935, helps to augment and conserve water in Long Island's groundwater reservoir--the sole source of freshwater for nearly 3 million people in Nassau and Suffolk Counties. Also included are the quantity and the quality of precipitation, inflow, and infiltration rates at selected basins, and evaluation of the regional effects of recharge basins on the hydrologic system of Long Island. ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR URBAN STUDIES IN THE AUSTIN, TEXAS METROPOLITAN AREA, 1971,
Geological Survey, Austin, Tex.
F. H. Tovar.
Texas District open-file report, May 1973. 73 p, 3 fig, 1 tab.

Descriptors: *Hydrologic data, *Urban hydrology, *Urbanization, *Rainfall-runoff relationships, *Texas, Data collections, Streamflow, Stream gages, Flow rates, Peak discharge, Storm runoff, Urban runoff.
Identifiers: *Austin (Tex).

The U. S. Geological Survey, in cooperation with the Texas Water Development Board, began hydrologic studies in the Austin urban area in 1954 to determine the effects of progressive urbanization on infiltration, rates rainfall-runoff relations in the Waller Creek watershed; to provide rainfall and runoff data from the rural Wilbarger Creek watershed to be used for comparative purposes in determining the effects of existing and progressive urbanization in the Waller Creek watershed; and to provide applied research facilities for studies at the University of Texas at Austin. Rainfall and runoff data are presented for the Waller Creek and Wilbarger Creek study areas for the 1971 water year (October 1, 1970, to September 30, 1971). Weighted-mean rainfall was 18.31 inches, 44% below the mean annual rainfall for Austin. Mean daily discharge was 0.25 cfs; annual runoff was 0.73 inches, or 4% of rainfall. One storm period, October 22-23, 1970, was selected for analysis. A summary of rainfall-runoff data for each storm is tabulated. Computations with hydrograph and mass curves for each storm are included. (Woodard-USGS)

Descriptors: Water pollution sources, Chemical wastes, *Chemical analysis, *Mass spectrometry, *Oil spills, *Pesticides, *Pollutant identification, Analytical techniques, Fishkill, Polychlorinated biphenyls, Organoleptic properties, *Nuclear magnetic resonance, Taste, Odor, Oil pollution, Resins.

A multitude of analyses using gas chromatography-mass spectrometry (GC-MS), nuclear magnetic resonance (NMR), infrared, and fluorescence spectroscopy to identify and measure organic pollutants in water are discussed under eleven project categories. In most cases these analyses have helped to solve, or at least understand more clearly, the related pollution incident and in some cases provided for enforcement of regulatory legislation. Projects included identification of pesticides and PCB's from natural waters, organics from industrial wastewaters and landfill runoffs, organics from paper mill wastewaters and foam, and analyses of oils from oil spills and suspect sources. (EPA)

POLAROGRAPHIC DETERMINATION OF NTA,
Environmental Protection Agency, Athens, Ga. Southeast Environmental Research Lab.
T. B. Hoover.
Copy available from GPO Sup Doc as EP1.23/2:73-254, $0.75; microfiche from NTIS as PB-222 940, $1.45. Environmental Protection Technology Series Report EPA-R2-73-254, June 1973. 44 p, 9 fig, 8 tab, 33 ref. EPA Project 16020-EWE.

Descriptors: *Analytical techniques, *Polarographic analysis, *Nitrilotriacetic acid, Sea water, Sewage, Chemical analysis, Water analysis, *Pollutant identification.
Identifiers: *Bismuth-NTA, *Indium-NTA, Linear sweep voltammetry, Differential pulse polarography.

Pulse differential polarography was found to be a more sensitive and precise method than linear sweep voltammetry for the determination of NTA as the bismuth complex in natural and waste waters. Indium was a less satisfactory complexant. Relative standard deviations of less than 5% were obtained by the dual cell pulse differential technique at 1 ppm NTA and calibrations were linear from 0.01 to 4 ppm. Copper, added at concentrations greater than 10-5 M, caused low analytical results for NTA. No other significant interference by metals or complexants was found. An acetate electrolyte was much better than chloride for the determination of bismuth-NTA complex in sewage-type samples. Recommended procedures are given in the appendix. (EPA)

COMBINED SAMPLING AND FLOW MEASUREMENT,
R. R. Carr.
Public Works, Vol 104, No 4, p 71, April 1973. ref.

Descriptors: *Sampling, *Automation, *Mechanical equipment, *Sewage effluents, *Flow rates, Waste water (Pollution).

A sampler for wastewater treatment plant effluents, which integrates automatic sampling with flow measurement, employs a plastic pipe with special insert as the main body with solenoid operated tapered plungers seated in rubber sleeves to provide valving. The sampler is fastened upright in an open channel and is activated with a timer and battery to allow the backed up liquid to enter the sampler. When the valve plungers drop the sample discharges into a receiving vessel. Daily flow is ascertained by multiplying the total volume collected by the formula constant for the weir or flume. HANDBOOK FOR ANALYTICAL QUALITY CONTROL IN WATER AND WASTE WATER LABORATORIES.
National Environmental Research Center, Cincinnati, Ohio.

EPA Report, June 1972. 110 p, 17 fig, 15 tab, 36 ref.

Descriptors: *Laboratory tests, *Laboratory equipment, *Quality control, *Methodology, *Control systems, *Water quality control, Physical properties, Chemical properties, Instrumentation, Evaluation, Testing procedures, Materials, Water analysis, Statistics, Data processing, Data storage and retrieval, Chemical analysis, Monitoring, Computers, Computer programs, Organic compounds, Conductivity, Turbidity, Hydrogen ion concentration, Ions, Electrodes.
Identifiers: Errors, Cleanup, Data interpretation, Organic carbon, Carbon analyzer, pH meters, Atomic absorption spectrophotometry, STORET, Arsenic, Cyanides, Ion selective electrodes, Gas liquid chromatography, Thin layer chromatography, Column chromatography, Reagents.

Subject matter of the handbook is concerned primarily with quality control for chemical and physical tests and measurements. Sufficient information is offered to allow the reader to inaugurate, or to reinforce, a program of analytical quality control which will emphasize early recognition, prevention and correction of factors leading to breakdowns in the validity of data. The first chapter is on the importance of quality control. This introduction is followed by consideration of: (1) laboratory services, i. e., distilled water, CO2-free water, ion free water; (2) instrumental quality control of balances, pH meters, turbidimeters, conductivity meters, spectrophotometers, organic C analyzers, ion electrodes; (3) glassware; (4) reagents, solvents, and gases; (5) analytical performance control with its precision, accuracy and evaluation; (6) data handling and reporting, including storage and retrieval, from report forms to computers; (7) special requirements for trace organic analysis involving sample treatment and types of useful chromatography; and (8) the importance of skills and training in overall quality control. THE FATE OF SOLUBLE MUCHIN IN THE GASTRO-INTESTINAL TRACT OF SHEEP,
Cambridge Univ. (England). Dept. of Veterinary Clinical Studies.
J. F. Hecker.
Journal of Agricultural Science, Vol 80, p 63-69, 1973, 4 tab, 40 ref.

Descriptors: *Nitrogen, *Sheep, Enzymes, Hydrolysis.
Identifiers: *Soluble mucins, *T.C.A.-soluble mucin, Rumen liquor, Caecal liquor, Faecal liquor, Gastro-intestinal tracts, Fucose, Rhamnose, Hexose, Methyl pentose, Histology.

The fate of soluble mucins in the gastro-intestinal tract of sheep was determined. Incubation of a soluble mucin with liquor from large intestinal contents resulted in loss of mucin. Some of this loss was due to soluble enzymes. The loss of mucin was less when incubation was with rumen liquor and varialbe when with ileal liquor. The mean amounts of nitrogen in a soluble mucin fraction which was soluble in trichloroacetic acid (T.C.A.-soluble mucin) were 2.5, 7.3, and 20.0 mg per 100 ml in rumen, caecal and faecal liquors respectively. These amounts were only a small proportion of the total soluble nitrogen in these fluids. Amounts of T.C.A.-soluble mucin, measured by sugar content, were greatest in contents from the small intestine. When the amounts of T.C.A.-soluble mucin were compared with the amounts of lignin in the samples, there was an increase between the abomasum and the first part of the small intestine and than a decrease to the caecu. Amounts relative to lignin were low in other parts of the gastro-intestinal tract. The liquors was in ileal liquor. The presence of the methyl pentoses, fucose and rhamnose indicates that the T.C.A.-soluble mucin is derived from mucus and bacteria. (East-Central)

IDENTIFICATION OF BEEF CATTLE FEEDLOT ODORS,
Texas Tech Univ., Lubbock. Dept. of Chemical Engineering.
R. M. Bethea, and R. S. Narayan.
Transactions of the ASAE, American Society of Agricultural Engineers, p 1135-1137, 1972, 2 fig., 2 tab., 10 ref. (Order No. T 1135).

Descriptors: *Air pollution, *Odor, *Cattle, *Feed lots, *Farm wastes, *Gases, Gas chromatography, Solubility, Alcohols.
Identifiers: Amines, Aldehydes, Esters, Carbonyls.

The qualitative nature of the gases present in the atmosphere around a beef cattle feedlot was studied. The selective solubility method was adopted for identification of volatile organic compounds caused by cow manure. Gas chromatographic analysis extended the findings of the solubility tests. A feedlot chamber was set up for a 550 pound steer in order to obtain information about compounds present in the atmosphere of enclosed feedlots. The chamber was managed three ways. One week it was thoroughly cleaned and washed each day. The next week it was shoveled out, but not washed. The third week it was not cleaned at all. During the first phase, only a few odoriferous contaminants were generated. When daily washings were discontinued, indole and skatole were detected in the chamber atmosphere. The number of compounds present in this atmosphere increased threefold during the last phase. It is inferred that chamber management has tremendous influence on the organic compounds present in the atmosphere of an enclosed feedlot. (Hisle-East Central)

BACTERIOLOGICAL PROCEDURES FOR ANALYZING WET AND DRIED POULTRY FECES,
Michigan State Univ., East Lansing. Dept. of Poultry Science.
H. C. Zindel, T. S. Chang, and G. R. Carter.
Journal Article No. 5928, Michigan Agricultural Experiment Station, College of Agriculture and Natural Resources, Michigan State University, East Lansing, 1972, 4 p, 2 ref.

Descriptors: *Farm wastes, *Dehydration, *Poultry, *Bacteria, *Chemical analysis, Recycling, Incubation, Michigan.

The accurate analysis of feces, both wet and dry, for chemical and bacteriological content is important since animal feces is a raw product which has great potential if properly gathered, processed and utilized. When Michigan State University began a dehydration process several years ago, it obtained bacteria count and identification as well as chemical analysis for both wet and dry fecal samples. The bacteria present in the feces after the drying process were identified and recorded. Some bacteria were present after the drying process, but they were not thought to be significant because most of them were normal flora in the intestinal tract of chickens and some of them are commonly known contaminants. Their presence either suggested that the retention time of the feces in the dryer was not long enough to destroy all bacterial populations or that they were recontaminated while leaving the drying unit. (Hisle-East Central)
W73-13841

EFFECT OF EUTROPHICATION ON BOD TESTING UNDER TURBULENT CONDITIONS,
Windsor Univ. (Ontario). Dept. of Civil Engineering.
H. I. Ali, and J. K. Bewtra.
In: Proceedings 19th Annual Technical Meeting, 'Realism in Environmental Testing and Control,' April 2-5, 1973, Disney Hotel, Anaheim, California, p 432-436, 1973. 7 fig, 11 ref.

Descriptors: *Water analysis, *Biochemical oxygen demand, *Turbulence, Water pollution, Algae, Eutrophication, *Pollutant identification, *Canada.
Identifiers: *Light-dark incubation, *Grand Marais Drain (Windsor).

The effect of turbulence on BOD progression of a waste water sample containing algae and incubated at light-dark 50:50 every day was investigated. Algae from highly polluted Grand Marais Drain (Windsor, Canada) were cultured initially at 8.0 pH (at which many bacteria are inhibited without interfering with the development of most algae) at about 23C in the laboratory under twelve hours of light and 12 hours of darkness alternatively. A significantly lower BOD is obtained with alternate light and dark incubation of a sample containing algal cells than that obtained with standard incubation in dark. With the alternating incubation, rate of photosynthetic oxygen produced by algae is much greater than consumed by respiration. Continuous stirring of the BOD samples containing algal cells results in a significant increase in oxygen production by photosynthesis as compared to the unstirred samples. The light-and-dark incubation method, with continuous stirring would more nearly simulate existing conditions in streams as well as in aerated oxidation ponds and, if properly used, would give more representative BOD parameters than those obtained with standard dark incubation methods. Descriptors: *Polarographic analysis, Pollutants, *Pulp wastes, *Sulfur compounds, *Sulfides, Chemical analysis, Aeration, Analytical techniques, Effluents, Water analysis, *Pollutant identification.
Identifiers: *Mercaptans, USSR, Kraft mills.

A modified polarographic method for the determination of mercaptans and sulfides in kraft pulp mill effluents utilizes a dropping mercury cathode, a saturated calomel anode, and a mixture of 1 ml 5N hydrochloric acid, 41.7 ml ethanol (95%), and 2.3 ml distilled water as electrolyte. Analyses of specific and overall mill discharges, conducted in an inert helium gas atmosphere, indicated that the presence of sulfides did not interfere with mercaptan determinations. Turpentinic digester relief condensates, sampled from the Kotlas kraft mill, contained 11.5 to 27.6 mg per liter of mercaptans, calculated as methylmercaptan (methanethiol). Exposure of the samples to air for 15 min led to virtually complete oxidation, indicating air-exposed kraft mill effluents are unlikely to contain mercaptans. The new method requires 20 min per test run and has an error limit of 5%. Its sensitivity is 4-5 mg of mercaptan and 2.5-3.2 mg of sulfide per liter. (Stapinski-IPC)

AUTOMATED SOLVENT EXTRACTION FOR THE DETERMINATION OF TRACE METALS IN WATER BY AAS (ATOMIC ABSORPTION SPECTROPHOTOMETRY),
Department of the Environment, Burlington (Ontario). Centre for Inland Waters.
P. D. Goulden, P. Brooksband, and F. F. Ryan.
American Laboratory, Vol 5, No 8, p 10-14, 16-17, Aug. 1973. 5 fig, 1 tab, 9 ref.

Descriptors: *Water analysis, *Trace elements, *Automation, *Monitoring, *Metals, *Cations, Spectrophotometry, Chemical analysis, Analytical techniques, Chelation, Solvent extractions, Solvents, Zinc, Copper, Iron, Chromium, Manganese, Molybdenum, Flame photometry, Water chemistry.

Increasing needs for monitoring the quality of natural waters prompted the development of a continuous, completely automatic method of trace metal determination. The solvent extraction technique described can handle 40 samples per hour and has a detection limit of 0.5 microgram per liter. It is based on complexing of the metal with ammonium pyrrolidine dithiocarbamate (APDC), followed by quantitative extraction of the complex with methyl isobutyl ketone (MIBK), separation of the MIBK phase, and aspiration into the flame of an atomic absorption spectrophotometer. Although developed and tested primarily for analysis of copper and zinc, the method requires only minor modifications for application to iron, chromium, and other metals, using an air-acetylene flame. Seawater samples have been analyzed using a saline wash solution. Chelating agents other than MIBK can be used, e.g., 8-quinolinol for manganese, and alpha-benzoin oxime for molybdenum. Butyl acetate has been used successfully as solvent. Chloroform and other heavier-than-water solvents reduce the separation problem. In intermittent semiautomatic operations, which may be necessitated, e.g., by cleaning of nitrous oxide-acetylene flame burners, or by sample injection with a syringe when a carbon rod atomizer is used, major benefits can still be realized, e.g., removal of the minimum solvent flow constraint. (Brown-IPC)
W73-14047

DETECTION OF NATURALLY FLUORESCENT PESTICIDES ON SILICA GEL LAYERS,
Moncton Univ. (New Burnswick). Dept. of Chemistry.
V. Mallet, D. Surette, and G. L. Brun.
Journal of Chromatography, Vol 79, p 217-222, May 16, 1973. 2 fig, 3 tab, 21 ref.

Descriptors: *Fluorescence, *Pesticides, *Pollutant identification, Carbamate pesticides, Fungicides, Rodenticides, Insecticides, Miticides, Fumigants, Fluorometry.
Identifiers: Detection limits, *Thin layer chromatography, Benomyl, Coumatetralyl, Diphacin, Fuberidazole, Propyl isome, Quinomethionate, Diphacinone, Synergists, Fluorescent spectra.

A number of fluorescent pesticides, namely, benomyl, coumatetralyl, diphacinone, fuberidazole, propyl isome and quinomethionate, have been investigated on silica gel thin-layer chromatograms. The pesticides were prepared in solutions of methylene chloride. For determination of detection limits, dilution series of each pesticide were prepared in n-hexane from the original solutions. Fluorescene spectra were measured and visual detection limits estimated. In most cases, as little as a few nanograms could be detected. In addition, the effects of heat treatment of the fluorescence were observed. The most pronounced effect is a large bathochromic shift of the fluorescence excitation and emission maxima. (Little-Battelle)
W73-14058

A METHOD FOR THE IDENTIFICATION OF BRANCHED-CHAIN PARAFFINS BY CALCULATION OF THEIR RETENTION INDEX VALUES ON THE BASIS OF MOLECULAR STRUCTURE AND PHYSICAL PROPERTIES,
G. Castello, M. Lunardelli, and M. Berg.
Journal of Chromatography, Vol 76, p 31-44, February 7, 1973. 6 fig, 6 tab, 28 ref.

Descriptors: *Separation techniques, *Gas chromatography, *Physical properties, Pollutant identification, Equations, Mathematical studies.
Identifiers: *Paraffins, *Retention indices, Retention time, Dimethylbutane, Dimethylpentane, Methylhexane, Ethylpentane, Trimethylpentane, Dimethylhexane, Methylethylpentane, Methyloctane, Trimethylhexane, Trimethylheptane, Dimethyloctane, Methylnonane.

The retention times of branched-chain paraffins were shown to depend on their physical properties, especially molecular volume, when non-polar phases were used for their separation. As the molecular volume depends strongly on structure, the calculation of additive terms, which are

characteristic of every structural group in a molecule, can permit the theoretical calculation of the retention indices of any branched isomer. The additive terms can be calculated both by solving a system of equations and by comparison of the retention indices of selected compounds. The general application of the method to retention data taken from the literature is also possible. (Little-Battelle)
W73-14059

IDENTIFICATION OF ACTINOMYCES, ARACHNIA, BACTERIONEMA, ROTHIA, AND PROPIONIBACTERIUM SPECIES BY DEFINED IMMUNOFLUORESCENCE,
Central Hospital, Vasteras (Sweden). Dept. of Clinical Bacteriology.
K. Holmberg, and U. Forsum.
Applied Microbiology, Vol 25, No 5, p 834-843, May 1973. 4 tab, 53 ref.

Descriptors: *Pollutant identification, *Pathogenic bacteria, *Anaerobic bacteria, *Aerobic bacteria, Methodology, Isolation, Coliforms, Enteric bacteria, Classification.
Identifiers: *Actinomycetes, *Immunofluorescence, Characterization, *Serotypes, Sample preparation, Culturing techniques, Rothia dentocariosa, Bacterionema matruchotii, Actinomyces israelii, Actinomyces odontolyticus, Arachnia proprionica, Propionibacterium acnes, Propionibacterium avidum, Propionibacterium granulosum, Propionibacterium jensenii, Actinomyces viscosus, Actinomyces naeslundii, Serology, Immunoglobulin G, Fluorescein-isothiocyanate conjugated antisera.

Fractionated fluorescein-isothiocyanate (FITC)-conjugated immunoglobulin G (dye-to-protein ratio less than 10), produced against whole cells of Actinomyces spp, Arachnia, Bacterionema, Rothia, and Propionibacterium spp, give species-specific conjugates with controlled nonspecific staining reactions when appropriately diluted on the basis of their antibody content (10 mg/ml). Using this standardization in immunofluorescence, serotype-specific conjugates are also available after dilution for all serotypes of these organisms except for Actinomyces viscosus type 2, and Propionibacterium acnes type 1. Adequately adsorbed conjugates could be used to differentiate these serotypes from A. viscosus type 1 and P. acnes type 2, respectively. A serological classification in defined immunofluorescence corresponded to species and serotype designation proposed on the basis of other serological analysis and biochemical characteristics. This includes a separation in immunofluorescence of two serotypes of Propionibacterium acnes. The detection of certain actinomycetes of the family Actinomycetaceae and Propionibacterium species by the defined immunofluorescence in direct smears prepared from clinical specimens agreed to 88 percent with parallel culturing when including a prereduced (PRAS) medium technique for isolation. Qualitative studies revealed that single cells of these organisms could be specifically identified by immunofluorescence when admixed with morphologically similar bacteria and a large number of other contaminants. MICROFLORA OF SOIL AS VIEWED BY FREEZE-ETCHING,
Pennsylvania State Univ., University Park. Dept. of Microbiology
D. L. Balkwill, and L. E. Casida, Jr.
Journal of Bacteriology, Vol 114, No 3, p 1319-1327, June 1973. 14 fig, 4 tab, 20 ref.

Descriptors: *Soil microorganisms, Methodology, *Separation techniques, *Cytological studies, Clay loam, Silts, Evaluation, Electron microscopy, Soil microbiology, Pollutant identification.
Identifiers: *Freeze etching, *Transmission electron microscopy, Sample preparation, Cell morphology, Ultrastructure.

A study was conducted to determine whether the soil microbial population could be viewed and evaluated by transmission electron microscopy of replicas of frozen-etched cells physically removed from the soil. In addition simpler methods of cell separation were investigated as an alternative to those required for thin-section studies. Three samples of Hagerstown silty clay loam were obtained; the indigenous microflora of soil were released from the soil materials and concentrated without the occurrence of growth by use of a blending-simple centrifugation procedure. The cell concentrate was then frozen-etched and viewed by transmission electron microscopy. Criteria were established for detecting microbial cells among the residual soil debris. The freeze-etching of the soil cell concentrate provided results on cell size distributions in agreement with those obtained by thin sectioning. However, the blending-simple centrifugation procedure for cell release and concentration from soil allowed the observation of large cells (greater than or equal to 1.0 micron in diameter) which apparently are missed by the 'exhaustive centrifugal washing' cell separation-concentration procedure. The procedure of blending-simple centrifugation combined with the viewing of frozen-etched preparations allowed evaluations of the soil microflora for cellular diameters, length-width ratios, shapes, and structure. THE FATTY ACIDS OF PSEUDOMONAS MULTIVORANS (PSEUDOMONAS CEPACIA) AND PSEUDOMONAS KINGII,
Center for Disease Control, Atlanta, Ga.
S. B. Samuels, C. W. Moss, and R. E. Weaver.
Journal of General Microbiology, Vol 74, No 2, p 275-279, February 1973. 2 tab, 27 ref.

Descriptors: *Pollutant identification, *Pseudomonas, Cultures.
Identifiers: *Gas liquid chromatography, Pseudomonas multivorans, Pseudomonas kingii, *Fatty acids.

The fatty acid compositions of three strains of Pseudomonas multivorans and three of P. kingii were determined by gas-liquid chromatography. The major fatty acids identified were 16:0, 16:1, 18:1, 3-OH 14:0, 3-OH 16:0 and cyclopropane acids 17 delta and 19 delta. The fatty acid compositions of these strains were similar to the acids identified in sixteen clinical isolates of the 'P. multivorans (P. cepacis)/P. kingii group'. These data support the current view that P. multivorans and P. kingii are identical species. (Little-Battelle)

INFLUENCE OF ABSORPTION COEFFICIENT ON REFLECTANCE OF WATER,
Missouri Univ., Rolla. Dept. of Mechanical and Aerospace Engineering.
D. C. Look, A. L. Crosbie, B. F. Armaly, and H. F. Nelson.
Journal Water Pollution Control Federation, Vol 45, No 5, p 936-939, May 1973. 8 fig, 9 ref.

Descriptors: *Reflectance, *Remote sensing, Absorption, Light, Water, Equations, Mathematical studies, Infrared radiation, Refractivity.

To determine one effect that an absorption coefficient, represented by the imaginary portion of the index of refraction, has on reflectance, the computed reflectance for the real values of the index

of refraction was compared with the value of index of fraction equal to zero. The values of the imaginary portion of the index of refraction less than 0.02 have no effect on the reflectance from a water surface. It therefore can be assumed in computing reflectance that, except for the X absorption bands in the near infrared and all of the far infrared, water is a perfect nonconductor. (Little-Battelle)

Descriptors: *Systematics, *Speciation, *Midges, *Ecology, *Canada, Ecological distribution, Niches, Aquatic habitats, Growth stages, Aquatic insects, Lakes, Trophic level, Diptera, Spatial distribution, Profundal zone, Oligotrophy, Mesotrophy, Sands, Classification.
Identifiers: *Monodiamesa species *Nearctic species, *Palaearctic species, Insect morphology, Lake Winnipeg, Animal morphology, Sublittoral zone, Substrates, Chironomids.

Three Nearctic species of Monodiamesa are described: Monodiamesa depectinata sp.n. from imagines, pupae, and fourth- and third-instar larvae; and Monodiamesa prolilobata sp.n. from male imagines. A larva possibly belonging to M. prolilobata is described. These are the first records and descriptions of imagines, pupae, and larvae of the Nearctic and Palaearctic species of the genus. Monodiamesa depectinata occurs in the Laurentian Great Lakes area and in Lake Winnipeg, Manitoba. It was taken from sandy substrates in the lower littoral and the sublittoral zones of oligotrophic to mesotrophic lakes. Monodiamesa tuberculata occurs from the mainland of British Columbia through the prairie provinces and the Northwest Territories to the Laurentian Great Lakes. It was taken from the sublittoral and profundal zones of oligotrophic lakes and in some lakes is probably a glacial relict. Monodiamesa prolilobata, from west of the Rocky Mountains, probably covers the combined ecological niches of the two more easterly species. (Holoman-Battelle)

SELECTIVE ELECTRODE MEASUREMENT OF AMMONIA IN WATER AND WASTES,
National Environmental Research Center, Cincinnati, Ohio.
R. F. Thomas, and R. L. Booth.
Environmental Science and Technology, Vol 7, No 6, p 523-526, June 1973. 6 tab, 4 ref.

Descriptors: *Ammonia, *Water analysis, *Pollutant identification, Surface waters, Sewage, Saline water, Methodology, Chemical analysis, Wastes, Waste water (Pollution).
Identifiers: *Ammonia electrodes, Accuracy, Ion selective electrodes, Precision.

The use of an ammonia selective electrode in the determination of ammonia in surface waters, sewage samples, and saline waters was investigated. The electrode exhibited Nernstian behavior at a minimum concentration of 0.02 mg NH3-N/l in distilled water and 0.03 mg NH3-N/l in actual samples. When the values obtained for river and sewage samples were compared to those from the indophenol blue method on a Technicon AutoAnalyzer, the results differed by an average of 1.2 percent and 4.6 percent, respectively. On river water samples, the known addition method was tested against direct measurement (use of a calibration curve) and found to be acceptable. In addition to being inexpensive, the ammonia electrode offered the advantages of minimal sample and reagent preparation prior to analysis, wide concentration range, precision and accuracy comparable to accepted methods, and speed (maximum of 5 min per sample). AN IMPROVED BACTERIAL TEST SYSTEM FOR THE DETECTION AND CLASSIFICATION OF MUTAGENS AND CARCINOGENS,
California Univ., Berkeley. Dept. of Biochemistry.
B. N. Ames, F. D. Lee, and W. E. Durston.
Proceedings of the National Academy of Sciences, Vol 70, No 3, p 782-786, March 1973. 1 fig, 4 tab, 18 ref.

Descriptors: *Toxicity, *Bioassay, Salmonella, Pathogenic bacteria, Cultures.
Identifiers: *Salmonella typhimurium, *Mutagens, *Carcinogens, Sample preparation, Sensitivity.

A set of four strains of Salmonella typhimurium designed for detecting the various types of mutagens was described, and showed their utility in detecting a wide variety of carcinogens as mutagens. The lipopolysaccharide that normally coats these bacteria is a barrier to penetration of mutagens to the cell membrane. The set of tester strains has been improved by adding a mutation (rfa: deep rough) that results in a deficient lipopolysaccharide. The techniques for using these strains for detecting mutagens are presented and the tests are shown to be extremely sensitive and convenient. The specificity of frameshift mutagenesis is clarified. As adjuncts to the test with the four strains, a test is described that compares mutagenic killing in deep rough strains with and without DNA excision repair. Also described is a test using forward mutagenesis in a deep rough strain lacking excision repair. (Little-Battelle)

RELATIONS AMONG RADIONUCLIDE CONTENT AND PHYSICAL, CHEMICAL, AND MINERAL CHARACTERISTICS OF COLUMBIA RIVER SEDIMENTS,
Geological Survey, Washington, D.C.
J. L. Glen, and R. O. Van Atta.
Available from GPO, Washington, D.C. 20402, Price $0.85. Geological Survey Professional Paper 433-M, 1973. 52 p, 20 fig, 25 tab, 63 ref.

Descriptors: *Radioisotopes, *Columbia River, *Sediments, *Washington, Cooling water, Nuclear reactors, Chemical analysis, Ion exchange, Cation exchange, Bottom sediments, Particle size, Correlation analysis, Nitrogen, Carbon, Mineralogy, Model studies, Methodology, Pollutant identification.

Radionuclides discussed were produced by neutron activation of elements in Columbia River water used to cool the nuclear reactors in the Hanford area near Pasco, Wash., prior to their final shutdown early in 1971. After return of the low-level radioactive cooling waters to the Columbia River, some radionuclides were attached to sediment particles, and some particles were incorporated in the streambed. Data are presented on radionuclides in size separates of streambed sediments and relations among radionuclide content, particle size, cation-exchange capacity, carbon and nitrogen content, and mineralogy. Two simplified qualitative models were used to aid interpretation of streambed-sediment and radionuclide data. One model assumes a fixed streambed and reversible uptake-release reactions that are dependent mostly on solute radionuclide concentrations. The second model involves sediment transport and considers irreversible uptake reactions that are dependent mostly on solute radionuclide concentrations. (Woodard-USGS)

INVESTIGATION OF ENVIRONMENTAL INDICES FROM THE EARTH RESOURCES TECHNOLOGY SATELLITE, PR 568/MMC 200,
MITRE Corp., McLean, Va.
E. L. Riley, S. Stryker, and E. A. Ward.
Available from NTIS, Springfield, Va 22151 as N73-10376, Price $3.00 printed copy; $1.45 microfiche. Interim Contract Report, February 1973. 138 p, 20 fig, 11 tab.

Descriptors: Water quality, *Air pollution, *Land use, *Aerial photography, *Satellites (Artificial), *Pennsylvania, Data processing, Digital computers, Mapping, Correlation analysis, Methodology, Remote sensing.
Identifiers: *Environmental indices, *ERTS, *Susquehanna River.

Land use, water quality, and air quality trends are being deduced from both ERTS-1 MSS imagery and computer compatible tapes (CCT's). The data analysis plan (Phase I) and the preliminary data analysis phase (Phase II) were concluded in January 1973. Progress made during the first 6 months of investigation to determine environmental indices from ERTS-1 data is described. The specific objectives of the investigation include: land use trends for two test areas in Pennsylvania over the August 1972--October 1973 time period; air quality/turbidity mesoscale trends over all of Pennsylvania for the August 1972-October 1973 time period; water quality along the Susquehanna River for one overflight date, October 11, 1972; specifications for an operational system using an ERTS-type system, and selected analysis software for water, land and air environmental indices calculation and display; and the possibility of automatic digital signature determination, i.e., the elimination of signature redeterminations for each imagery. LABORATORY EVALUATION OF RESIDUES MAINTAINED IN WATER TREATED WITH POLYETHYLENE FORMULATIONS OF CHLORPYRIFOS, DECEMBER 1971 - APRIL 1972,
Army Environmental Hygiene Agency, Aberdeen Proving Ground, Md.
M. A. Lawson.
Available from the National Technical Information Service as AD-755 517. Report No. USAEHA-44-013-72/73, April 1972. 14 p, 4 fig, 3 ref, 2 append.

Descriptors: *Pesticide residues, *Water analysis, Separation techniques, Pesticides, Phosphothioate pesticides, Chlorinated hydrocarbon pesticides, *Gas chromatography, Statistical methods.
Identifiers: *Chlorpyrifos, Electron capture gas chromatography, Persistence.

Laboratory evaluations were conducted for 16 weeks to compare, under static conditions, residue levels maintained in water treated with three chlorinated polyethylene pellet formulations of chlorpyrifos (0,0-diethyl 0- (3,5,6-trichloro-2-pyridyl) phosphorothioate). All pellets were cylindrical in shape and had a specific gravity greater than 1.0. Each formulation was evaluated at dosages of 0.25, 0.5 and 1.0 ppm in one gallon glass jars containing three liters of distilled water. Treatments and controls were replicated three times. Water samples were removed from the jars weekly, partitioned with hexane, and subjected to electron capture gas chromatographic analysis to determine chlorpyrifos residues. Data were subjected to three way analysis of variance to determine effects of formulation, dosage, week after treatment, and the interactions thereof, on residues maintained in the water. Peak residue levels occurred within seven to ten weeks after treatment for all formulations at each dosage. A gradually decreasing trend in residues began after ten weeks for all formulations. Higher dosages resulted in significantly higher residue levels during each week of the study. There were no significant differences among the three formulations in the amount of residues maintained in the water during the 16 week test. (Little-Battelle)

DETERMINATION OF BENOMYL RESIDUES IN SOILS AND PLANT TISSUES BY HIGH--SPEED CATION EXCHANGE LIQUID CHROMATOGRAPHY,
Du Pont de Nemours (E. I.) and Co., Wilmington, Del. Industrial and Biochemicals Dept.
J. J. Kirkland, R. F. Holt, and H. L. Pease.
Journal of Agricultural and Food Chemistry, Vol 21, No 3, p 368-371, May/June 1973. 3 fig, 4 tab, 8 ref.

Descriptors: *Soil analysis, *Plant tissues, *Soils, Pesticide residues, Carbamate pesticides, Loam, Silts, Sands, Separation techniques, Pollutant identification, Fungicides, Ion exchange, Peaches, Oranges, Apples, Pecans, Corn (Field), Carrots, Beans, Sugar beets.
Identifiers: *Benomyl, *Liquid chromatography, *Sample preparation, Biological samples, Chromatograms, Apricots, Cherries, Grapes, Celery, Cucumbers, Cantaloupe, Squash, Cation exchange liquid chromatography, Chemical recovery.

Benomyl (methyl 1- (butylcarbamoyl)-2-benzimidazolecarbamate) residues in soils and plant tissues may be determined by procedures using high-speed cation exchange liquid chromatography (1c). The method for soils is based on an acidic methanol extraction of the residues, which converts residual benomyl to MBC (methyl 2-benzimidazolecarbamate). After a liquid-liquid partitioning cleanup, the total benomyl and/or MBC residues are measured as MBC by high-speed liquid chromatography. Any 2-AB (2-aminobenzimidazole) present in the original sample is also extracted and simultaneously determined as a separate 1c peak. Recoveries of benomyl, MBC, and 2-AB from various types of soils average 92, 88, and 71 percent, respectively. The lower limit of sensitivity of the method is 0.05 ppm for each of these components. The method for plant tissues is based on ethyl acetate extraction of the residue followed by liquid-liquid partitioning cleanup and liquid chromatographic measurement. Recoveries and limit of sensitivity of this method for plant tissues were essentially that found for soils. (Little-Battelle)
W73-14195

A PROBE FOR SAMPLING MIRE WATERS FOR CHEMICAL AND GAS ANALYSIS,
Nottingham Univ. (England). Dept. of Botany.
R. J. Summerfield.
Plant and Soil, Vol 38, No 2, p 469-472, April 1973. 1 fig, 1 tab, 5 ref.

Descriptors: *Water sampling, *Methodology, *Mechanical equipment, Chemical analysis, Dissolved oxygen, Construction, Operation and Maintenance, On-site investigations, Water analysis, Gases.
Identifiers: *Mire waters, Reliability.

In order to carry out accurate analysis of the oxygen dissolved in mire waters a method was devised for withdrawing water samples, relatively free from particulate matter, without contamination by atmospheric oxygen. A probe is introduced into the substrate, a few minutes are allowed for the collection chamber to become filled with mire water, and the sample is pumped out into a collecting bottle for analysis. The depth of insertion of the probe may be altered, samples may therefore be collected from different rooting zones for chemical or dissolved gas analysis. The construction and operation of the probe are described. (Holoman-Battelle)

ANTICATALYTIC MICRODETERMINATION OF MERCURY USING CERIUM-ARSENITE REACTION,
Windsor Univ. (Ontario). Dept. of Chemistry.
P. J. Ke, and R. J. Thibert.
Mikrochimica Acta, No 1, p 15-24, 1973. 2 fig, 3 tab, 21 ref.

Descriptors: *Mercury, *Pollutant identification, *Chemical reactions, *Aqueous solutions, Heavy metals, Methodology, Cations, Hydrogen ion concentration, Copper, Chromium, Bromides, Anions, Iodides, Inhibition, Chemical analysis.
Identifiers: *Cerium-arsenite reaction, *Anticatalytic kinetic method, Errors, Chemical recovery, Precision, Accuracy, Reliability, Reproducibility, Detection limits, Chemical interference, Ionic interference, Silver.

An anticatalytic kinetic method, based on the decreased rate of the reaction between Ce (IV) and As (III), was developed for the determination of mercury. The change in reaction rate due to inhibition by mercury was measured spectrophotometrically at 275 nm. The presence of the following ions in the reaction mixture (10 ml) did not interfere at a level of 0.1 mg: Na, K, ammonium, Ba, Mg, chloride, nitrate, sulfate, cyanide, and bicarbonate. Cu, Cr and bromide which catalyze the reaction between Ce and arsenite, yielded 10-15 percent negative error at 0.1-microgram level, and Ag gave serious interference. An increase of 10-15 percent recovery of Hg was observed with more than 50 micrograms of Ni (II), Co (II), Fe (III), and Zn (II). The As (III)/Ce (IV) reaction is extremely sensitive to iodide ions, and even with only 5 ng of iodide present in the reaction system, an error of 50 percent in the determination was observed for a sample containing 0.1 microgram of mercury. Amounts of mercury in the range 0.04 - 0.20 microgram were determined with an overall error of less than 5 percent at a reaction time of 25 minutes. (Holoman-Battelle)

BIOLOGICAL IMPACT OF COMBINED METALLIC AND ORGANIC POLLUTION IN THE COEUR D'ALENE-SPOKANE RIVER DRAINAGE SYSTEM,
Washington State Univ., Pullman.
W. H. Funk, F. W. Rabe, R. Filby, J. I. Parker, and J. E. Winner.
Available from the National Technical Information Service as PB-222 946, $5.50 in paper copy, $1.45 in microfiche. Joint Project Completion Report, June 30, 1973. 187 p, 56 fig, 31 tab, 84 ref. OWRR B-044-WASH (1), B-015-IDA (3). 14-31-001-3664, 14-01-001-3576.

Descriptors: Water quality, *Heavy metals, Benthos, Aquatic environment, Food chain, Neutron activation analysis, Spectrophotometry, *Algae, *Bioassay, *Phytoplankton, Sediments, Trace elements, *Washington, Metals.
Identifiers: Coeur d'Alene River, Coeur d'Alene Lake, Spokane River, Atomic absorption spectroscopy.

Biological effects of metallic and organic pollution in the Coeur d'Alene - Spokane River Lake drainage system were investigated. Water quality data show heavy inflows of nutrients during late spring into Coeur d'Alene Lake from the St. Joe and Coeur d'Alene Rivers and Plummer Creek. Although no water devoid of dissolved oxygen has been measured, 2-4 mg/l have been measured in the southern portion of the lake. Phytoplankton productivity measurements and bottom organism identification and enumeration have shown that the lake functions at several trophic levels. High metal concentrations (1000-7000 mg/kg Zn) in the bottom sediments of the middle and northern portions of the lake did not appear to substantially affect distribution of benthic chironomids or oligochaetes. Lake sediment cores taken across the delta region of the Coeur d'Alene River penetrated through the regions of high metallic concentration and allowed an average sediment deposition rate to be calculated. Algal toxicity tests showed the amount of Zn normally present in the Coeur d'Alene Lake and River and the Spokane River to be inhibitory to the algal test organism Selanastrum capricornutum. The water quality of the Spokane River was of good to excellent quality in all parameters tested except for high metallic content, especially Zn. Activation and atomic absorption analysis of the metallic content in tissues of the organisms in the Spokane River indicated that algae were the prime concentrators of Zn, Cd, Pb, Hg, Fe, and Mn. Algae and detritus consumers reflected high metallic concentrations. Analysis of fish tissues showed a considerably lower concentration of metals than the aquatic plants, insects, or algae. The fish, when collected, did not appear to be under stress leading to the belief that most of the metals--although present in relatively high concentrations in the tissues of the organisms tested-must be in a relatively innocuous state.

STRIP MINING, AN ANNOTATED BIBLIOGRAPHY,
R. F. Munn.
West Virginia University Library, Morgantown, 1973. 110 p

Descriptors: *Coal mines, *Strip mines, *Bibliographies, *Publications, Documentation, Abstracts, Water pollution sources, Pollution abatement, Mine wastes, Environmental effects, Legal aspects, Economics, Appalachian Mountain Region, United States

This annotated bibliography contains 611 references to aid those interested in the history, development, and problems associated with the strip mining of coal in the United States. References to other applications of strip mining--iron ore, bauxite, etc.--have been excluded as have references to operations outside the United States. The increasing energy requirements of the country and the shortage of other fuels make nationwide abolition of stripping seem unlikely in the near future. Thus disputes over practices and policies will continue. There will doubtless be some variations in both theme and tone. For example, much of the stripping may shift from Appalachia to the Western Plains. However, the basic concerns--economic, political and philosophical--will remain. (Woodard-USGS)

AN EVALUATION OF SOIL WARMING FOR INCREASED CROP PRODUCTION,
Oregon State Univ., Corvallis. Dept. of Soil Science.
A. Rykbost.
Ph D Thesis, June 1973. 275 p, 25 fig, 73 tab, 92 ref. OWRR B-019-ORE (2) and B-028-ORE (1).

Descriptors: Soils, Crop production, *Soil temperature, Cooling water, *Soil water, Oregon, Irrigation systems, Thermal pollution.
Identifiers: *Soil warming, *Thermal discharge, *Waste heat.

Objectives were: (1) to determine the effect, if any, of buried line heat sources on air temperatures within a crop canopy; (2) to determine the extent to which soil temperature can be elevated with buried line heat sources maintained at various temperatures; (3) to establish the effect of subsurface heating on soil water regimes and to evaluate a subsurface irrigation system as a means of maintaining high soil water content and hence high rates of heat transfer in the vicinity of heat sources; (4) to evaluate a theoretical model for prediction of energy dissipation rates; (5) to establish the yield response to soil warming for numerous crops; and (6) to evaluate the influence of subsurface heating on soil and air temperatures and crop production in a wood frame, plastic covered greenhouse. Results suggest that soil warming with condenser cooling waters from thermal power plants is feasible. Additional information is needed to evaluate the economic and engineering aspects of a soil warming system.

REMOTE SENSING STUDY OF THERMAL DISCHARGES TO LAKE MICHIGAN, ILLINOIS--INDIANA-MICHIGAN.
National Field Investigations Center-Denver, Colo.

Available from NTIS, Springfield, Va. 22151 as PB-214 407, Price $3.00 printed copy; $1.45 microfiche. Environmental Protection Agency Publication, October, 1972. 30 p, 16 fig.

Descriptors: *Thermal pollution, *Electric powerplants, *Lake Michigan, Remote sensing, Aerial photography, Data collections, Water temperature, Water pollution sources, Path of pollutants,

Pollution abatement, Federal Government, Illinois, Indiana, Michigan.

An aerial reconnaissance study of thermal discharges was conducted along the shoreline of Lake Michigan from South Haven, michigan, through Waukegan, Illinois. The flights were carried out during the afternoon hours on October 17, 1972 and October 19, 1972. Six powerplants were in operation during the course of this study. Thermal data were obtained at a distance of 1,000 feet from the discharge position. At the Palisades plant, the temperature increase at 1000 ft was 14.3 deg F (12.2 deg F at 2,000 feet); and at Waukegan the increase at 1000 ft was 16.1 deg F (3.4 deg F at 2,000 feet). The maximum allowable temperature recommended for October is 65 deg F. The Palisades powerplant was in violation of this 65 deg F temperature value at the 1,000 ft point. (Woodard-USGS)

IMPLICATIONS OF WASTE TREATMENT PROCESSES AND ARCTIC RECEIVING WATERS,
Alaska Univ., College. Inst. of Water Resources.
R. S. Murphy, and J. K. Greenwood.
In: Proceedings of lst International Conference on Port and Ocean Engineering under Arctic Conditions, Vol II, p 909-915, 1971, Technical University of Norway, Oslo. 1 fig, 15 ref.

Descriptors: *Water pollution sources, *Oil spills, *Alaska, *Arctic, *Waste treatment, Human population, Projections, Ecosystems, Ecology, Environmental effects, Oil industry, Construction, Pipelines, Sediment transport, Water quality, Water pollution control.

The emerging status of North America's Arctic and sub-Arctic is continuing to cause national and international debates on possible environmental degradation to a fragile and rare ecosystem. The most frequently heard fear centers around oil spills (petroleum of course, being the prime reason for most existing activity in the Far North). A close second is the concern about distrubing the protective tundra overlying the permafrost and the ensuing erosion, failures to manmade structures, and alteration of natural migration paths and breeding areas of various arctic and subarctic fauna. Some of the problems of waste treatment and disposal are described in arctic Alaska, mainly the Prudhoe Bay region. Projected populations for the whole North Slope are described. Communities with populations greater than 1,000 to 2,000 persons will be rare, and total population will probably not exceed 10,000 on the North Slope. Greater populations than this may be present for short periods during construction activities, however. (Woodard-USGS)

VERTICAL DISTRIBUTION OF DISSOLVED TRACE ELEMENTS IN BLACK SEA WATER (O VERTIKAL'NOM RASPREDELENII MIKROELEMENTOV, RASTVORENNYKH V VODE CHERNOGO MORYA),
Z. A. Vinogradova, N. Z. Yeremina, and G. M. Kogan.
Akademiya Nauk SSSR Doklady, Vol 204, No 3, p 704-706, 1972. 1 fig, 1 tab, 10 ref.

Descriptors: *Geochemistry, *Water chemistry, *Trace elements, *Solutes, *Sea water, Metals, Organic matter, Carbon, Water sampling, Depth.
Identifiers: USSR, *Black Sea, Vanadium, Tin.

Hydrochemical investigations and, in particular, study of the concentration of biologically active chemical elements are helpful in determining various aspects of the productivity and dynamics of different water types. To study vertical distribution of trace elements in the Black Sea, samples of sea water were collected from standard depths in bottles made of vinyl plastic. Between the surface and a depth of 2.5 cm, samples were collected in a flat Plexiglas container. Vertical distribution of dissolved iron, manganese, and copper in the sea water is extremely nonuniform, while the concentration of nickel, cobalt, and vanadium varies little between the surface and a depth of 2,000 m. Variations in the average concentration of Fe, Cu, Mn, V, Ni, Co, and organic carbon with depth are graphed, and concentrations of Cu, Sn, Mn, Fe, V, Co, Ni, Al, Mo, and Pb (in micrograms/liter) are tabulated. Akademiya Nauk SSSR Doklady, Vol 204, No 1, p 203-206, 1972. 3 fig, 2 tab, 6 ref.

Descriptors: *Amino acids, *Organic matter, *Suspended solids, *Sediments, *Pore water, Geochemistry, Biochemistry, Sampling.
Identifiers: USSR, *Black Sea.

Amino acid concentrations in suspensions, water, sediments, and pore solutions were investigated in the Black Sea in the autumn of 1968. Samples of water and suspended material were taken at two deep-water stations at depths of 0, 15, and 100 m in the oxygen zone and at depths of 200, 1,000 and 2,000 m in the hydrogen sulfide zone. Surface sediment samples were collected at 7 stations along the Gelendzhik-Sinop profile. The amino acid concentration in suspended material varies between 19 and 91 micrograms/liter, averaging 33.0 micrograms/liter. The concentration of amino acids dissolved in water ranges from 111 to 643 micrograms/liter and averages 256.0 micrograms/liter. The amino acid concentration in surface sediments varies between 378 and 6,440 micrograms per gram of dry material, averaging 1,658 micrograms/g. High concentrations of amino acids are found in deep-sea sediments (1,950 m, 2,180 m), while lower concentrations are found in shallow-water sediments (92 m, 100 m). The concentration of amino acids in pore solutions ranges from 1,289 to 6,000 micrograms/liter and averages 3,100 micrograms/liter. Amino acids are grouped according to their chemical nature (acid, basic, neutral, aromatic, and sulfur-bearing amino acids), and their concentrations in suspensions, water sediments, and pore solutions (in percent) are tabulated. (Josefson-USGS)

LIMITATIONS OF THE ELECTRICAL RESISTIVITY METHOD FOR DETECTING LANDFILL LEACHATE IN ALLUVIAL DEPOSITS,
Iowa State Univ., Ames. Dept. of Earth Sciences.
G. E. Klefstad.
M Sc Thesis, 1973. 106 p, 25 fig, 6 tab, 40 ref, 2 append. OWRR A-047-1A (1).

Descriptors: *Water pollution sources, *Landfills, *Iowa, *Sanitary engineering, *Water quality, Groundwater, Analytical techniques, Piezometers, Geology, Resistivity, Physical properties, Geophysics, Chemical analysis.

Sanitary landfills situated on Iowa floodplains were investigated. Five sites were chosen to provide a range in landfill size and age as well as a variation in the average grain size of the alluvial deposits in which the landfills are situated. The five study sites are located in or near the Iowa cities of Ames, Council Bluffs, Cedar Falls, Des Moines, and Mason City. The resistivity study was conducted employing the Wenner electrode configuration. Piezometers were installed and groundwater samples were collected and analyzed on a monthly basis. Some landfill sites proved better suited for electrical investigations than others. In the cases of the Omaha and the Des Moines studies, the landfills were located too close to the river to establish an adequate station network not only in the contaminated zone but also in the uncontaminated areas, so that a comparison could not be made. In the Spring Lake and the Des Moines studies, problems of urban development and buried conductors were encountered which complicated the interpretation of the resistivity results. The Mason City study indicated that the degree of contamination present at a site also plays an important role, that is, a chloride concentration of 360 ppm can be detected but a value of 85 ppm cannot. DISTRIBUTION OF EPILITHIC ALGAE ON UPPER REACHES OF YOSHI-GAWA RIVER: III. ECOLOGICAL STUDIES OF EPILITHIC ALGAE IN WINTER IN KONGO-GAWA RIVER, MITSUISHI-CHO, OKAYAMA PREFECTURE, (IN JAPANESE),
I. Imada.
Bull Jap Soc Phycol. Vol 20, No 1, p 23-29. 1972. Illus. (English summary).
Identifiers: *Algae (Epilithic), Bacillariophyceae, Chlorophyceae, Cyanophyceae, Distribution patterns, Ecological studies, *Japan (Kongo-Gawa River), Rivers, Temperature, Winter, Yoshii-Gawa River.

Observations made on the ecological studies of epilithic algae in the Kongo-Gawa River, Mitsuishi-cho, Okayama Prefecture, Japan, in January, 1968 are discussed. Distribution of epilithic algae, water temperature, dissolved oxygen, KMnO4-consumption, and pH-value were measured at 7 stations. The water temperature was 6.4 approximately 9.0C the dissolved oxygen was 12.42 ml/1 approximately 16.52 ml/1, KMnO4-consumption was 8.04 mg/1 approximately 26.53 mg/l. The pH was 7.15 approximately 7.50. Bacillariophyceae always dominate throughout all stations about 47.6% (st. E) 84.5% (st. C). The maximum cell number of Bacillariophyceae was 29,300/mm2 at station A, and the minimum was 4600/mm2 at station B. Cyanophyceae and Chlorophyceae were inferior in the cell number at all stations, about 25.4% and 19.99%, respectively. The cell number of the Cyanophyceae varied 2700 approximately 7300/mm2, the maximum cell number was 7300/mm2 at station D, and minimum cell number was 2700/mm2 at station B. The cell number of the Chlorophyceae varied 700 approximately 5800/mm2, the maximum cell numbers was 5800/mm2 at station A, and minimum cell number was 700/mm2 at station C. The quantity of Cyanophyceae was larger downstream in the Kongo-Gawa River, but that of Bacillariophyceae was fewer.--Copyright 1973, Biological Abstracts, Inc.

PLUME TEMPERATURE MEASUREMENTS OF SHALLOW, SUBMERGED MODEL DISCHARGES WITH CURRENT,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg. National Thermal Pollution Research Program.
L. D. Winiarski, and J. P. Chasse.
Available from the National Technical Information Service as PB-223 014, $5.00 in paper copy, $1.45 in microfiche. Environmental Protection Technology Series Report No. 2, EPA-660/2-73-001, January 1973. 54 p, 29 fig, 6 tab, 1 ref. Program Element 1 B 1032.

Descriptors: *Water cooling, *Jet diffusion, *Diffusers, Mixing, Dilutation, Dispersion, Thermal pollution, Heated water, Water temperature, Thermal water, Entrainment, *Plumes, *Model studies.
Identifiers: Shallow discharge, Towing channel.

Laboratory studies were conducted with a shallow-submerged thermal discharge model in a flowing ambient stream. Plume behavior, characterized by excess temperature, trajectory, and width, was observed to determine the qualitative effects of the discharge angle, Froude number, relative stream velocity, and turbulence in the ambient water. Increasing the angle of discharge in a vertical plane parallel to the direction of stream flow caused increased dilution and lower temperatures along the trajectory. Jets of higher Froude number diluted less than those of lower Froude number for the same discharge angle and relative stream velocity. With no turbulence in the ambient stream, dilution was increased by a reduction in the ambient stream velocity. However, in a turbulent stream, dilution was decreased by a reduction in the ambient velocity. (EPA)

POLLUTION LOADS IN PERCOLATE WATER FROM SURFACE SPREAD SWINE WASTES,
Maryland Univ., College Park. Dept. of Agricultural Engineering.
H. L. Brodie.
Available from the National Technical Information Service as PB-223 015, $3.00 in paper copy, $1.45 in microfiche. Water Resources Research Center, University of Maryland, College Park, Technical Report No. 13, October 1972. 25 p, 1 fig, 6 tab, 21 ref. OWRR A-019-MO (1).

Descriptors: *Groundwater pollution, *Farm wastes, *Hogs, *Percolation, *Flood irrigation, *Waste disposal, Nitrogen, Chemical oxygen demand, Phosphates, Chlorides, Sulfates, Maryland.

The effectiveness of the soil as a receptor for the concentrations of nutrients and organics in periodic high rate flood applications of liquid swine wastes was investigated. A lysimeter was used for collecting soil percolate waters after flood application of liquid waste or tap water and after rainfall in order to test the soil as a high-rate physical and biological filter for liquid swine wastes. Samples of the saturated flow were removed at depths of 25, 50, and 75 centimeters in the profile and tested for concentrations of chemical oxygen demand, ammonium nitrogen, chloride, total phosphate, and sulfate. The concentrations were compared with the concentrations of the applied liquid to determine net decrease of concentration through the soil profile. Results indicated that flood irrigation can lead to groundwater pollution. (Marquard-East Central)

PERSISTENCE OF MANURE PHOSPHORUS AVAILABILITY IN CALCAREOUS SOIL,
Arizona Univ., Tuscon. Dept. of Soils, Water and Engineering.
J. L. Abbott, and T. C. Tucker
Soil Science Society of America Proceedings, Vol 37, No 1, p 60-63, January-February, 1973. 1 fig, 5 tab, 11 ref.

Descriptors: *Fertility, *Waste disposal, *Phosphorus, Nitrogen, *Calcareous soils, Cotton, Barley, Alfalfa, Arizona, Cycling nutrients
Identifiers: *Plant nutrition, Pollution control

The contribution of P from manure to Calcareous soils was studied on a Mohave clay loam. Manure treatments involved different amounts and frequency of manure application, and were split with nitrogen variables of 0, 84, and 168 kg/ha. Total P content of manures ranged from 3-5 kg per metric ton during the course of study. The results indicated that manure is an effective source of P as illustrated by the increased P content of cotton, barley, and alfalfa tissue as well as soil analysis. Manuring at 2 or 3 year intervals at 22 metric tons/ha assures adequate P availability, while P availability from phosphate fertilizers may be negligible over the same period. (Marquard-East Central)

CHARACTERISTICS OF CATTLE FEEDLOT SURFACE RUNOFF,
J. C. Ward, E. M. Jex, and T. E. Norton.
Typescript, (1970), 4 p, 1 tab.

Descriptors: *Feed lots, *Surface runoff, Dissolved solids, Biochemical oxygen demand, *Cattle, Conductivity, Hydrogen ion concentration, Water pollution sources.
Identifiers: Volatile solids, Van't Hoff-Arrhenius relationship, Onsager equation.

This study has two parts: (1) the complete mixing of cattle manure with distilled water to obtain characteristics of the manure, and (2) examination of surface runoff samples from cattle feedlots in order to ascertain their characteristics as a function of several hydrologic variables. In part 1, the supernatant from samples was examined for conductivity, pH, dissolved solids, volatile solids, and BOD. In part 2, a simulated rainfall apparatus was utilized to obtain runoff samples. These samples were analyzed on the spot and in the laboratory for ultimate BOD, conductivity, alkalinity, settleable suspended solids, volatile solids, and dissolved solids. (Dudley-East Central)

AGRICULTURAL WASTES--A MANAGEMENT PROBLEM,
Ohio State Univ., Columbus.
E. P. Taiganides.
In: Frontiers in Conservation, Proceedings, 24th Annual Meeting, Soil Conservation Society of America, Colorado State University, Fort Collins, August 10-13, 1969, p 90-92, (1969) 2 fig.

Descriptors: *Farm wastes, *Pollution, *Waste disposal, Subsidy, Chemicals, Confinement pens, *Municipal wastes, *Management.
Identifiers: Urban-rural interface.

Our nation's fundamental problems are poverty, pollution, population, and politics. It is necessary to have integrated and coordinated management of resources at the urban-rural interface to prevent environmental pollution. Although particular attention is given to waste management from animal confinement units, all production systems create waste. Regardless of the source urban or rural, all of these wastes are either organic or inorganic and either solid or liquid. The wastes from all rural and urban areas must be considered as a regional problem whose solution will need the cooperation of the agricultural, industrial, urban, and other political sectors of the nation. A need exists to demonstrate the benefits of cooperation between the rural and urban sectors with an integrated regional scheme of using agricultural soils and nonproductive rural land for waste disposal. SALMONELLA IN THE LAYING HEN. I. SALMONELLA RECOVERY FROM VISCERA, FECES AND EGGS FOLLOWING ORAL INOCULATION,
Louisiana State Univ., Baton Rouge. Dept. of Poultry Science.
N. A. Cox, B. H. Davis, A. B. Watts, and A. R. Colmer
Poultry Science, Vol 52, No 2, p 661-666, March, 1973. 3 tab, 21 ref.

Descriptors: *Salmonella, *Farm wastes, *Poultry, Bacteria, Diseases, Analysis, Tissues, *Contamination, Eggs.
Identifiers: Inoculation, Seftenberg, Thompson, Typhimurium.

A study was made to determine the fate of Salmonella organisms after ingestion by the laying hen. Three species of Salmonella were used, i.e., senftenberg, thompson and typhimurium. Approximately one million cells of each species were introduced into the crop of 12 White Leghorn type laying hens for 10 days. The trials involving each species were carried out consecutively with thorough disinfection of equipment between trials. From each hen, feces and eggs were analyzed daily for Salmonella for the 10 day period. At the end of the 10 day trial a sample of blood was drawn from each hen for Salmonella analysis. In addition, the hens were slaughtered and a sample of the ovaries, kidneys, heart, liver and lungs was aseptically removed for analysis. Approximately 25% of the fecal samples contained the species of Salmonella under study. The percentage of positive recoveries from egg shells was less than 10% for all three species studied. Among the egg contents examined for all three species, only one egg yielded a positive recovery. All tissue samples were negative. It was concluded that there was no contamination of body tissues even after continuous ingestion of large doses of Salmonella organisms. Neither was there a problem of egg meat contamination among intact eggs. (East Central)

NUTRITIONAL INTERRELATIONSHIPS OF DIETARY CALCIUM, PHOSPHORUS, AND MAGNESIUM IN SHEEP,
Florida Univ., Gainesville. Dept. of Animal Science.
C. F. Chicco, C. B. Ammerman, J. P. Feaster, and B. G. Dunavant.
Journal of Animal Science, Vol 36, No 5, p 986-993, May 1973, 1 fig, 6 tab, 28 ref.

Descriptors: *Calcium, *Phorphorus, *Magnesium, *Sheep, Metabolism.
Identifiers: *Nutritional interrelationships, Plasma, Fecal excretion, Basal diet, Femur deposition.

Four experiments were conducted with 116 wethers to study dietary interrelationships of calcium, phosphorus and magnesium. Including all experiments dietary levels varied as follows: calcium 0.13 to 0.78%, phosphorus 0.12 to 0.36%, and magnesium 500 to 7,750 ppm. Treatment effects on fecal, urinary, plasma and bone mineral levels were observed. In two experiments, the utilization of oral Ca and P was measured. High dietary calcium increased calcium in plasma (P<.05) and feces (P<.10 to P<.01) and decreased magnesium in bone and plasma (P<.05). High calcium increased fecal phosphorus (P<.01) and tended to reduce plasma phosphorus. Excess dietary magnesium reduced plasma calcium (P<.01), appeared to increased fecal loss of calcium but had no effect on bone calcium. High magnesium increased the level of magnesium in urine (P<.01), plasma (P<.05 to P<.01) and bone (P<.05 to P<.01). High dietary phosphorus with a Ca:P ratio of 1:3 increased fecal calcium (P<.05), but, at a higher level of calcium with a Ca:P ratio of 1:1, phosphorus enhanced calcium retention. Supplemental phosphorus increased plasms phosphorus and reduced plasma calcium (P<.01). (East Central)

CARBON MONOXIDE IN THE BIOSPHERE: CO EMISSION BY FRESH-WATER ALGAE,
Argonne National Lab., Ill.
H. L. Crespi, D. Huff, H. F. DaBoll, and J. J. Katz.
Available from the National Technical Information Service as PB-213 914. Final Report, October 1972. 26 p, 10 fig, 2 tab, 18 ref.

Descriptors: *Aquatic algae, *Air pollution, Biochemistry, Photosynthesis, Pigments, Synthesis, Degradation (Decomposition), Chlorophyll, Cyanophyta, Chlorophyta, Chlorella, Scenedesmus, Carbon dioxide.
Identifiers: *Carbon monoxide, Phormidium luridum, Fremyella diplosiphon, Synechococcus vividus, Chlorella vulgaris, Scenedesmus obliquus.

The described experiments indicate that biogenesis, and, particularly degradation, of photosynthetic pigments are large and previously unsuspected contributors to carbon monoxide in atmosphere. Carbon monoxide can be produced by algae and higher plants by at least two pathways. The prosthetic groups of the two characteristic photosynthetic pigments of blue-green algae, phycocyanin and phycoerythrin, result from oxidation of a tetrapyrrole macronucleus such as chlorophyll. The chemistry is probably similar to conversion of heme of hemoglobin in animals to bile pigments, a process producing one molecule of CO for each molecule of heme transformed to bile pigment. Chemical relationship between chlorophyll and algal bilins is very similar to that of heme and bile pigment. Production of CO by blue-green algae by this process is strongly species specific. Degradation of chlorophyll in dying plant material is a second way for plants to produce CO, for chlorophyll degradation might also follow a course analogous to heme degradation. These data may be interpreted as: biosynthesis of bilinoid pigments in blue-green algae yields CO; degradation of chlorophyll in both blue-green and green algae yields CO; and additional unknown source of CO exists in plants. COMPUTER STUDIES OF ESTUARY WATER QUALITY,
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
D. O. Hodgins, and M. C. Quick.
In: Proceedings of the 13th Coastal Engineering Conference, July 10-14, 1972, Vancouver, B.C., p 2327-2338 (1972). 8 fig, 3 ref.

Descriptors: *Computer models, *Estuaries, *Water quality, Computer programs, Dispersion, Convection, *Canada, Seasonal, Tides, Stratification, Saline water intrusion, *Path of pollutants.
Identifiers: *Fraser River Estuary (Canada), Pitt Lake (Canada), Straight of Georgia (Canada).

This study determines and traces the water movements resulting from tide and river flows in the Fraser River estuary, Canada. These water movements are calculated by determining numerical solutions of the hydrodynamic equations. The solutions are transferred to a convection and diffusion computer sub-model as the basis for determining water quality conditions resulting from effluent discharges entering the system at known points. The method is used to determine the convection and diffusion of the conservative pollutants. The Fraser River is one of the few remaining major salmon rivers and supports a major portion of both the Canadian and the United States salmon fishing industry. At the present time it is relatively undeveloped and flows are only slightly regulated. The basic program is a Dronkers type one-dimensional hydrodynamic model, interfaced with a model of salt water intrusion in the seaward reach. The salt wedge analysis reveals the nature of the interfacial stress which is not a function of velocity or velocity squared. It is shown that the interfacial stress is a function of entrainment, rather like a Reynolds stress, and plots are given of interfacial stress against local Richardson number multiplied by local upper layer velocity. SOLUBILITY AND OCCURRENCE OF LEAD IN SURFACE WATER,
Geological Survey, Menlo Park, Calif.
J. D. Hem, and W. H. Durum.
Journal of the American Water Works Association, Vol 65, No 8, p 562-568, August 1973. 4 fig, 3 tab, 25 ref.

Descriptors: *Lead, *Water pollution sources, *Path of pollutants, Water pollution, Water chemistry, *Solubility.

The solubility of lead in river water was evaluated and compared with lead concentrations determined in field studies of surface waters. Direct measurements of the rate of transfer of lead from the atmosphere to the land surface were made for two periods in May and June 1971 in Menlo Park, California. Samples of rainfall obtained at the U.S. Geological Survey in Menlo Park during the 1971 calendar year showed a wide range of lead concentration, from a few micrograms per liter to more than 100 micrograms per liter. A considerable amount of the lead could usually be removed by filtration of the rainwater. The total rainout of lead was small compared with the dry fallout rate. Direct fallout of larger particles containing lead is the most important transfer mechanism at Menlo Park, and the fallout process is probably relatively constant and to a considerable degree independent of rainfall. Generally, regions most productive of runoff are less likely to have a high lead fallout rate, but runoff originating in urban areas may tend to be high in lead concentration. Higher lead concentrations in runoff water and perhaps also in impounded raw-water supplies should therefore be anticipated in such areas as the northeastern U S, urbanized areas in the South, and along the Pacific Coast. High concentrations of lead in stream sediment can be expected in most urbanized areas, expecially the larger ones that are located in relatively dry climatic regions. (Knapp-USGS)
